TABLE OF CONTENTS

LIST OF TABLES

1. EXECUTIVE SUMMARY

This report documents the determination of the Best Available Retrofit Technology (BART) as proposed by Holcim (US) Inc. (Holcim) for the Portland cement manufacturing plant located in Clarksville, Missouri (Clarksville plant). This analysis is for the kiln system. Currently, particulate matter emissions from the kiln are controlled by an electrostatic precipitator. The Clarksville plant has other lesser emitting BART-eligible emissions units, all of which have Particulate Matter Control Devices (PMCDs) installed. The negligible visibility impairment attributable to these sources concludes that no additional controls are necessary to satisfy the requirements of the BART rule.[1]

Holcim used the U.S. Environmental Protection Agency's (EPA's) guidelines[2] in 40 CFR Part 51 to determine BART for the kiln. Specifically, Holcim conducted a five-step analysis to determine BART for SO_2, NOX, and PM_{10} that included the following:

1. Identifying all available retrofit control technologies;
2. Eliminating technically infeasible control technologies;
3. Evaluating the control effectiveness of remaining control technologies;
4. Evaluating impacts and document the results;
5. Evaluating visibility impacts

Based on the five-step analysis, Holcim proposes the following as BART:

Kiln:

- PM_{10} – Holcim has determined that the existing electrostatic precipitator constitutes BART. This control device is effective for controlling PM_{10} from a wet kiln.

- NO_X – Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system.

- SO_2 – Holcim proposes that no additional SO_2 controls are required for BART compliance. Additional SO_2 controls would require significant expenditures relative to the visibility improvements and are not justified.

The proposed BART control strategies will result in reductions of the visibility impacts attributable to the Clarksville plant. A summary of the visibility improvement at Class I areas based on the existing emission rates and proposed BART emission rates is provided in Table 1-1.

[1] Holcim submitted an inventory of all of the BART-eligible emission sources to the MDNR. Based on a review of this information, the MDNR concluded that the contributions from particulate matter from the non-kiln sources to visibility impairment is negligible and further analysis of these smaller particulate matter sources was not required. Meeting with the MDNR dated January 23, 2008.

TABLE 1-1. VISIBILITY IMPAIRMENT IMPROVEMENT

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
BART 98% Impact (Δdv)	0.92	0.72	0.60
Improvement 98% Impact (Δdv)	8.9%	11.1	1.6%

2. INTRODUCTION AND BACKGROUND

On July 1, 1999, the U.S. EPA published the final Regional Haze Rule (RHR). The objective of the RHR is to improve visibility in 156 specific areas across with United States, known as Class I areas. The Clean Air Act defines Class I areas as certain national parks (over 6000 acres), wilderness areas (over 5000 acres), national memorial parks (over 5000 acres), and international parks that were in existence on August 7, 1977.

On July 6, 2005, the EPA published amendments to its 1999 RHR, often called the Best Available Retrofit Technology (BART) rule, which included guidance for making source-specific BART determinations. The BART rule defines BART-eligible sources as sources that meet the following criteria:

(1) Have potential emissions of at least 250 tons per year of a visibility-impairing pollutant,
(2) Began operation between August 7, 1962 and August 7, 1977, and
(3) Are included as one of the 26 listed source categories in the guidance.

A BART-eligible source is subject to BART if the source is "reasonably anticipated to cause or contribute to visibility impairment in any federal mandatory Class I area." EPA has determined that a source is reasonably anticipated to contribute to visibility impairment if the 98th percentile visibility impacts from the source are greater than 0.5 delta deciviews (Δdv) when compared against a natural background. Air quality modeling is the tool that is used to determine a source's visibility impacts.

Once it is determined that a source is subject to BART, a BART determination must address air pollution control measures for the source. The visibility regulations define BART as follows:

> *"…an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant which is emitted by…[a BART-eligible source]. The emission limitation must be established on a case-by-case basis, taking into consideration the technology available, the cost of compliance, the energy and non air quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonable be anticipated to result from the use of such technology.*

Specifically, the BART rule states that a BART determination should address the following five statutory factors:

1. Existing controls
2. Cost of controls
3. Energy and non-air quality environmental impacts
4. Remaining useful life of the source
5. Degree of visibility improvement as a result of controls

Further, the BART rule indicates that the five basic steps in a BART analysis can be summarized as follows:

1. Identify all available retrofit control technologies;
2. Eliminate technically infeasible control technologies;
3. Evaluate the control effectiveness of remaining control technologies;
4. Evaluate impacts and document the results;
5. Evaluate visibility impacts

A BART determination should be made for each visibility affecting pollutant (VAP) by following the five steps listed above for each VAP.

BART applicability was determined for the Clarksville plant based on an applicability analysis performed by the MDNR and a refined applicability analysis performed by Holcim. Both analyses determined that the kiln is subject to BART. The details of the applicability determination can be found in Section 3.

Subsequently, Holcim performed an analysis to determine BART for each VAP for the kiln. The VAPs emitted by the kiln include NO_x, SO_2, and particulate matter with a mass mean diameter smaller than ten microns (PM_{10}) of various forms (filterable coarse particulate matter [PM_c], filterable fine particle matter [PM_f], elemental carbon [EC], inorganic condensable particulate matter [IOR CPM] as sulfates [SO_4], and organic condensable particulate matter [OR CPM] also referred to as secondary organic aerosols [SOA]). The BART determinations for SO_2 and NO_X can be found in Sections 4 and 5 respectively.

3. BART APPLICABILITY DETERMINATION

As stated in Section 2, a BART-eligible source is subject-to-BART if the source is "reasonably anticipated to cause or contribute to visibility impairment in any federal mandated Class I area." EPA has determined that a source is reasonably anticipated to contribute to visibility impairment if the 98th percentile of the visibility impacts from the source is greater than 0.5 Δdv when compared against a natural background. The MDNR conducted air quality modeling for the kiln to predict the existing visibility impairment attributable to the Clarksville plant in the following Class I areas:

- Mingo National Wildlife Refuge
- Hercules Glade Wilderness Area
- Upper Buffalo Wilderness Area

Based on this modeling, the MDNR concluded that the Clarksville plant was subject to BART since the 98th percentile of the visibility impacts attributable to the kiln are greater than 0.5 Δdv when compared against a natural background for a Class I area.

The modeling methods and procedures that Holcim followed were consistent with the methods and procedures that were followed in the MDNR's original modeling. Table 3-1 summarizes the emission rates that were modeled for SO_2, NO_X, and PM_{10}[3]. The SO_2 and NO_x emission rates are the highest actual 24-hour emission rates based on 2003-2007 continuous emissions monitoring system (CEMS) data. The PM_{10} emission rates are based on data included in Holcim's BART survey.

TABLE 3-1. MODELED 24-HOUR EMISSIONS (AS AN HOURLY EQUIVALENT)

SO_2 (lb/hr)	NO_X (lb/hr)	Total PM_{10} (lb/hr)
4889.38	3049.38	51.82

Table 3-2 summarizes the stack parameters that were used to model the kiln.

TABLE 3-2. SUMMARY OF STACK PARAMETERS

Parameter	Value
Actual Stack height (ft)	250
Stack Diameter (ft)	21.7
Exhaust Velocity (ft/s)	34.3
Exhaust Temperature (F)	367

The results of the modeling indicate that the 98th percentile of the visibility impacts are greater than 0.5 Δdv when compared against a natural background. Since the visibility impacts are greater than 0.5 Δdv, the kiln is subject to BART. The results of the modeling are summarized in Table 3-3.

[3] The non-kiln PM_{10} emissions were included in the model as part of the kiln PM_{10} emissions.

TABLE 3-3. SUMMARY OF 98TH PERCENTILE VISIBILITY IMPACTS AND NUMBER OF DAYS WITH VISIBILITY IMPACT GREATER THAN 0.5 ΔDV

Class I Area	Visibility Impairment	
	98th % Δdv	Days > 0.5 Δdv
Mingo Wilderness	1.01	75
Hercules Glades Wilderness	0.81	40
Upper Buffalo Wilderness	0.61	33

Table 3-4 provides a breakdown of the visibility impacts listed in Table 3-3 by each VAP for the high (98^{th} percentile) day (note that the specific percentiles vary from day to day, and location to location, the breakdown listed is an example of one event only).

TABLE 3-4. BREAKDOWN OF POLLUTANT SPECIFIC CONTRIBUTIONS TO VISIBILITY FOR THE 98TH PERCENTILE DAY.

Class I Area	Visibility Impairment Attributable to SO_4 (%)	Visibility Impairment Attributable to NO_3 (%)	Visibility Impairment Attributable to SOA (%)	Visibility Impairment Attributable to EC (%)	Visibility Impairment Attributable to PM_c (%)	Visibility Impairment Attributable to PM_f (%)	Total Visibility Impairment (Δdv)
Mingo Wilderness	98.6	1.2	0	0	0	0.2	1.01
Hercules Glades Wilderness	42.3	57.5	0	0	0	0.2	0.81
Upper Buffalo Wilderness	95.7	4.2	0	0	0	0.1	0.61

As shown in Table 3-4, the most significant contributors to the visibility impairment are sulfates (SO_4) and nitrates (NO_3). The SO_4 contribution is from the chemical conversion of SO_2 emitted by the kiln to SO_4. The NO_3 contribution is entirely from the chemical conversion of NO_X emitted from the kiln. The contribution of PM_{10} to the total visibility impairment can be estimated as the sum of the contributions from SOA, EC, PMc, and PMf. The PM_{10} contribution is much smaller (<1%) than the contribution from SO_2 and NO_X.

4. SO_2 BART EVALUATION

Sulfur, in the form of metallic sulfides (pyrite), sulfate, or organosulfur compounds, is often found in the raw materials used to manufacture cement and in the solid and liquid fuels burned in cement kilns.[4] The raw materials and fuels for the Clarksville plant are no exception. Sulfur dioxide can be generated by the oxidation of sulfur compounds in the raw materials and fuels during operation of the pyroprocess. Constituents found in fuels, raw materials, and in-process materials, such as the alkali metals (sodium and potassium), calcium carbonate, and calcium oxide react with SO_2 formed in the pyroprocess and much of the sulfur leaves the process in the principle product of the kiln system called clinker.

The kiln is the only BART source which emits SO_2, thus an SO_2 BART evaluation was performed only for the kiln. The maximum actual 24-hour kiln SO_2 emission rate that was modeled for the BART applicability determination is summarized in Table 4-1. .

TABLE 4-1. EXISTING ACTUAL MAXIMUM 24-HOUR SO_2 EMISSION RATES

	SO_2 24-Hour Emission Rate ton/24-hr	SO_2 Hourly Equivalent Emission Rate lb/hr
Kiln	58.67	4889.38

4.1 IDENTIFICATION OF AVAILABLE RETROFIT SO_2 CONTROL TECHNOLOGIES

Step 1 of the BART determination is the identification of all available retrofit SO_2 control technologies. A list of control technologies was obtained by reviewing the U.S. EPA's Clean Air Technology Center, publicly-available air permits, applications, and technical literature published by the U.S. EPA, state agencies, and Regional Planning Organizations (RPOs).

The available retrofit SO_2 control technologies are summarized in Table 4-2.

TABLE 4-2. AVAILABLE SO_2 CONTROL TECHNOLOGIES

SO_2 Control Technologies
Fuel Substitution
Raw Material Substitution
Dry Lime Injection/Scrubbing
Wet Lime Scrubbing

[4] Miller, F. MacGregor and Hawkins, Garth J., "Formation and Emission of Sulfur Dioxide from the Portland Cement Industry", *Proceedings of the Air and Waste Management Association*, June 18-22, 2000.

4.2 ELIMINATE TECHNICALLY INFEASIBLE SO_2 CONTROL TECHNOLOGIES

Step 2 of the BART determination is to eliminate technically infeasible SO_2 control technologies that were identified in Step 1.

4.2.1 FUEL SUBSTITUTION

Holcim uses a mixture of coal, petroleum coke, alternative fuels (synfuel), and oil as the primary fuels for the kiln. For example, the 2007 actual fuel usage breakdown on an energy input basis, was 3.4 percent coal, 84 percent petroleum coke, 11.8 percent synfuel, and 0.8 percent oil (the fuel usages are also on an as received basis). The sulfur content of the petroleum coke is approximately 5.72 percent and the sulfur content of the coal is approximately 3.45 percent.

The design of the long wet kiln system is such that some of the SO_2 resulting from fuel combustion may be emitted and the rest is absorbed in clinker or CKD. Therefore, if Holcim reduces sulfur in the fuel input to the kiln, a corresponding reduction in SO_2 emissions from the kiln would be expected. Fuel sulfur content could be reduced by burning a coal with a lower sulfur content of 0.7 percent, in lieu of the current coal/coke, which would result in a lower overall fuel sulfur content.

Determining the specific reduction in SO_2 emissions from a reduction in fuel sulfur is complicated as the reactions in the kiln system are complex. The sulfur is introduced into the system in the fuel as well as the raw materials (pyrites) and the sulfur exits the kiln system in the product (clinker), the cement kiln dust (CKD), and out the stack as SO_2. Further, although the sulfur in the clinker is small on a percentage basis, the magnitude of the clinker production is extremely large (greater than 1 million tons per year). Consequently, small changes in the amount of sulfur absorbed in the product can dramatically change the amount of SO_2 emitted. The variation in sulfur in the raw materials from the quarry, the clinker quality requirement determined by the market, and the kiln conditions can all cause significant changes in kiln operating parameters, such as kiln burning temperature, kiln excess Oxygen, etc. These changes can have a strong impact on the sulfur absorbed in the clinker and CKD and hence on SO_2 emissions. These operating conditions can also strongly change how the fuel sulfur affects SO_2 emissions. Reviewing the data yields that there is no linear correlation between fuel sulfur and SO_2 emissions. To calculate an SO_2 control effectiveness, based on switching to a lower sulfur fuel, a high number of assumptions must be made with a very low confidence in the accuracy. Regardless, an attempt has been made.

The assumptions, based on long term averages in 2007, which can vary significantly on an annual and short term (24-hr) basis, include that 65 percent of sulfur input in the kiln system is from fuel, 35 percent of sulfur input is from raw materials, and approximately 30-35 percent of total sulfur input is estimated to ultimately be emitted as SO_2 in the stack.

Based on the 2007 data, if all of the current coal and coke is replaced with low sulfur coal, the sulfur input from fuel is calculated to be reduced by approximately 85 percent. Following is a summary of the sulfur input reduction from the use of low sulfur coal. The low sulfur coal has a lower heat content (26 Gj/Metric ton) and higher moisture content

than the coke currently being used (33 Gj/Metric ton), so a higher volume of low sulfur coal is needed than coke reduced.

<u>Current – 2007 Average</u>

Coke Usage:	160,915 metric tons
Low Heat Content	32.510 Gj/Mt
Sulfur Content:	5.72 %
Sulfur Input from Coke:	9,204 metric tons
Current Coal Usage:	9,432 metric tons
Low Heat Content	22.177 Gj/Mt
Sulfur Content:	3.45 %
Sulfur Input from Coal:	325 metric tons

Total Sulfur Input from Coke/Coal: 9,529 metric tons

<u>Low Sulfur Coal Replacement</u>

Coal Usage:	208,546 metric tons
Heat Content	26.266 Gj/Mt
Sulfur Content:	0.7 %

Total Sulfur Input from Coal: 1,459 metric tons

<u>Net reduction in sulfur input from coal:</u>

9,529 metric tons – 1,459 metric tons = 8,070 metric tons = 8,893 tons

The SO_2 reduction calculation, based on the calculated sulfur reduction, is very complicated. The pyrite sulfur from the raw materials can volatilize at relatively low temperatures in the kiln, in an area where the sulfur comes in contact with the kiln feed that has only minimally been calcined into CaO. Consequently, less of this sulfur reacts with the CaO and thus is emitted. Again, if the sulfur reacted with the CaO, it would be absorbed into the clinker and CKD. The fuel sulfur, on the other hand, enters the kiln in the burning zone and travels the entire length of the kiln, coming in contact with much higher concentrations of CaO, thus having a much greater chance of being absorbed. Consequently, there is no simple linear relationship between fuel sulfur and SO_2 emissions that can be used to confidently calculate an SO_2 reduction.

The fuel sulfur reduction of 8,893 tons corresponds with a 54 percent reduction of the total sulfur (fuel and raw material sulfur) input to the kiln system in 2007. As mentioned above, a large fraction of fuel sulfur would have been absorbed by the CaO in the system, and thus would not have been emitted as SO_2, while SO_2 emitted from the pyrite in the raw materials has less of a chance of being absorbed, so there is not a directly proportional reduction in SO_2 with the sulfur reduction from the fuels, nor with the total sulfur reduction. Holcim estimates that based on the year 2007 data, the actual SO_2 reduction is about 40% - 50%.

These reductions are the maximum reductions in tons of SO_2 that can be expected, especially if overall emissions of SO_2 increase from other sources (such as raw materials). As mentioned previously, the actual reduction will vary significantly, especially on a short term basis. Holcim estimates that the net reduction in SO_2 would be in the range of 40 percent to 50 percent.

Holcim considers this technology to be technically feasible and will consider it further.

4.2.2 RAW MATERIAL SUBSTITUTION / SELECTIVE MINING

In a long wet kiln, not only the pyritic sulfur, but total sulfur in the raw materials will have an impact on SO_2 emissions.

Part of the pyritic sulfur reacts with oxygen and forms SO_2 at the relatively lower temperature zone of the kiln. The rest of the sulfur, such as sulfates and sulfur compounds, enters the kiln at higher temperature zones, where more SO_2 is volatized. Some of this SO_2 will pass the length of the kiln without being absorbed and will thus be emitted to the stack.

Using raw materials with lower sulfur content can reduce the potential for SO_2 emissions from a wet kiln system. The limestone, shale, and other raw materials used at the Clarksville plant contain pyrites and total sulfur in varying concentrations. If zones or layers in the on-site quarry could be identified and mined selectively such that lower sulfur content materials are used, the emission rate of SO_2 could be reduced. Holcim has conducted a complete quarry investigation, and based on the quarry scheduling optimization (QSO) model and computation, after 1-2 years of mining, the plant will be facing an area that has an even higher total sulfur content than that currently being used. Thus, there will be a higher total sulfur content in the raw material in the next 3-10 years. The total sulfur in the raw materials is expected to increase by an additional ~30% without selective quarrying, and by ~20% if some form of selective quarrying can be identified. Similarly, no significant reduction of pyritic sulfur from selective mining is anticipated.

Selective mining is not considered a technically feasible SO_2 control technology for the kiln. Moreover, Holcim is concerned that actual annual emissions resulting from normal variability at the plant will lead to an increase in SO_2 emissions as a result of total sulfur increases in the raw materials from the quarry. This variability will need to be considered in any potential BART control strategy.

4.2.3 DRY LIME INJECTION/DRY LIME SCRUBBING

Dry Lime Injection, or Dry Lime Scrubbing (DLS), consists of injecting hydrated lime, $Ca(OH)_2$, into the flue gas. The $Ca(OH)_2$ reacts with SO_2 in the flue gas stream to create fine particles of $CaSO_3$ or $CaSO_4$. The particles are collected in the particulate matter control device (PMCD) serving the kiln.

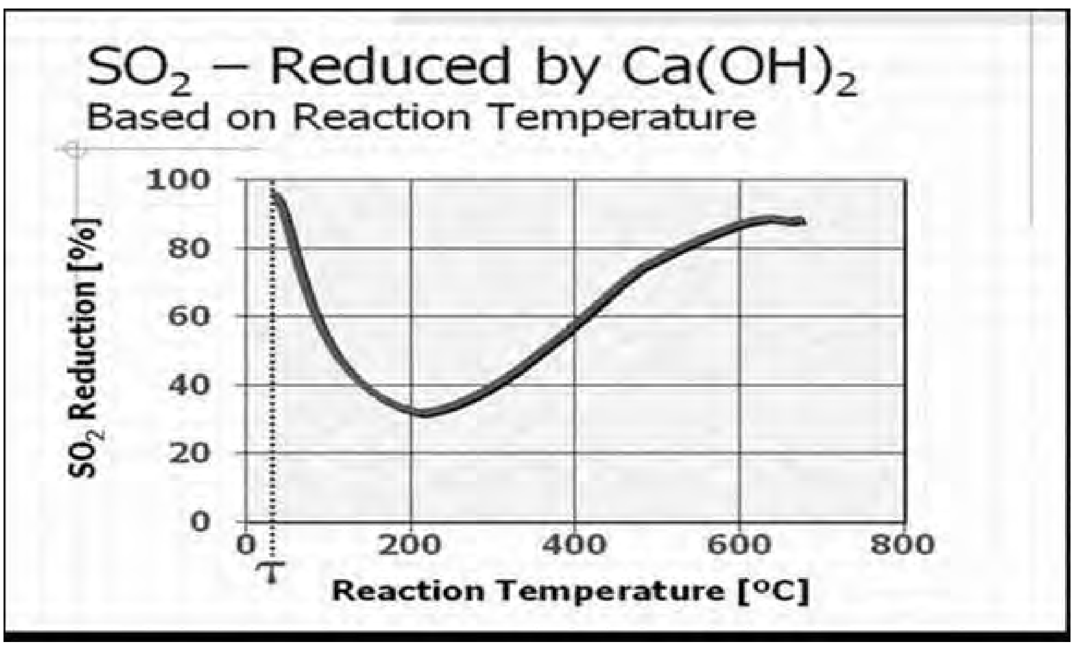
The current PMCD was not sized/designed to handle the additional particulate matter loading that would result from this technology. Consequently, adding DLS could cause

PM emissions and opacity to increase above permitted levels requiring Holcim to replace the existing PMCD (an ESP) with a new PMCD (a Baghouse).

Holcim is aware of only one other long term application of this technology on a wet kiln, which is on a smaller wet kiln in Belgium. Consequently, very little data exists to directly quantify the feasibility or benefit (emission reduction) of such a system. Regardless, Holcim is considering the technology to be technically feasible.

The effectiveness of DLS is impacted by both the temperature and the residence time/air flow rate at the location it is injected. At Clarksville, the injection point would be between the kiln outlet and the PMCD. At this location, the temperature is approximately 200 deg C (415 deg F). The temperature can not be increased at this location as the plant has limitations on the inlet temperature to the PMCD from both the Portland Cement MACT and the Hazardous Waste Combustion MACT in order to meet the Dioxin/Furan (D/F) limit. Further, lowering the temperature would lead to lower ESP efficiency and opacity problems. Figure 4-1 is a plot of SO_2 reduction versus reaction temperature from a commonly used article entitled “What is Achievable with Today’s Technologies”, Mark S. Terry, Krupp Polysius Corp, 2001. As indicated in the figure, at a temperature of 200 deg C (415 deg F), the reduction level is approximately 30 percent, which is the lowest reduction level over the temperature range presented.

FIGURE 4-1. SO_2 REDUCTION VERSUS REACTION TEMPERATURE FOR HYDRATED LIME



The molar ratio of lime (calcium source) to SO_2 is much higher than in a typical coal fired boiler due to a number of factors, some of which include the higher CO_2 and dust levels in the cement kiln system exhaust. The CO_2 competes with SO_2,in the reaction with the lime, and the higher dust loading reduces the even distribution of the lime in the gas. Based on a communication with the Obourg plant in Belgium, a molar ratio of between 4:1 and 6:1

has been used. The larger size of the Clarksville kiln will make it more difficult to evenly distribute the lime to the kiln gas and thus Holcim anticipates that a molar ratio of 6:1 will be required to achieve a maximum control efficiency of 20 - 30 percent.

Holcim considers this technology to be technically feasible and will consider it further.

4.2.4 WET LIME SCRUBBING

Wet lime scrubbing (WLS) is a name for a traditional tailpipe wet scrubber. This process involves passing the flue gas from the main PMCD through a sprayed aqueous suspension of $Ca(OH)_2$ or $CaCO_3$ (limestone) that is contained in an appropriate scrubbing device. In the case of the Clarksville plant, the basic underlying economics would dictate the use of ground limestone as the scrubbing reagent. Use of the cement kiln dust as a scrubbing reagent was not considered as a viable option for Clarksville due to its high chlorine content and a large amount of inerts. In WLS, the aqueous suspension of scrubbing reagent is not taken to dryness as it is in DLS. The SO_2 reacts with the scrubbing reagent to form $CaSO_3.H_20$ or gypsum that is collected and retained as aqueous sludge. The sludge is either dewatered and disposed of or used as synthetic gypsum.

The scrubbing efficiency of WLS can vary from an estimated 80 percent to 95 percent of the SO_2 in the flue gas treated by the scrubber[5]. Further, WLS is a high maintenance process with high rates of downtime expected from build up or plug up of mist-eliminators or spray nozzles and the severe wear and corrosion of components. Holcim has found that high levels of hydrocarbons (THC) in the gas stream have caused significant corrosivity and foam build-up at their Dundee plant. Further, it significantly influences the system availability and the efficiency. The THC levels at the Clarksville plant may also lead to build up and plugging, and thus an availability (uptime) of the WLS of 95 percent is assumed.

Despite these identified drawbacks, WLS is considered a technically feasible BART option.

4.3 RANK OF TECHNICALLY FEASIBLE SO_2 CONTROL OPTIONS BY EFFECTIVENESS

The third step in the BART analysis is to rank the technically feasible options according to effectiveness. Table 4-3 provides the effectiveness of each technology in the form of an annual average efficiency.

[5] Assessment of Control Technology Options for BART-Eligible Sources Steam Electric Boilers, Industrial Boilers, Cement Plants and Paper and Pulp Facilities. Prepared by Northeast States for Coordinated Air Use Management In Partnership with The Mid-Atlantic/Northeast Visibility Union, March 2005, Page 4-21, Table IV-4. Range of Removal Efficiencies of Wet SO2 Scrubbers for Long Wet Kilns.

TABLE 4-3. RANKING OF TECHNICALLY FEASIBLE KILN SO_2 CONTROL TECHNOLOGIES BY EFFECTIVENESS

Control Technology	Effectiveness SO_2 Reduction (Percent Reduction – Annual Basis)
Wet Lime Scrubbing	80-95%
Fuel Substitution	40-50%
Dry Lime Scrubbing	20-30%

4.4 EVALUATION OF IMPACTS FOR FEASIBLE SO_2 CONTROLS

Step four of the BART analysis procedure is the impact analysis. The BART determination guidelines list the four factors to be considered in the impact analysis:

- Cost of compliance
- Energy impacts
- Non-air quality impacts; and
- The remaining useful life of the source

Holcim has conducted an impact analysis for the remaining SO_2 control options.

4.4.1 WET LIME SCRUBBING

Cost of Compliance

Holcim utilized a recent WLS vendor bid as the basis for the economic analysis to determine the annualized cost for WLS. Holcim divided the annualized cost of WLS by the annual tons of SO_2 reduced to determine the cost effectiveness for WLS. The "annual tons reduced" were determined by subtracting the estimated controlled annual emissions from the existing annual emissions. The existing annual emissions should be considered both on a projected actual and a potential to emit (PTE) basis. The projected actual (PA) annual SO_2 emissions provided to the MDNR in the recent Mid Kiln Firing (MKF) permit application was 11,481 tons/year[6]. The PTE listed in the MKF permit is 13,298 tons/year. The estimated controlled annual emissions were calculated by applying an 80 percent to 95 percent control efficiency and a 95 percent control device uptime, to the projected actual annual and PTE emissions. Table 4-4 provides a summary of the cost effectiveness analysis related to WLS. The detailed cost analysis table is provided in Appendix A.

The equipment cost includes both the WLS system and a limestone preparation system. The limestone preparation system includes 2 Ball Mills used to grind the limestone received to a specific fineness.

[6] The projected actual annual emission rate was determined as part of the construction permit application process to support the August 27, 2007 Mid Kiln Firing construction permit. Permit Number 082007-019.

The cost effectiveness analysis does not include the cost to construct a new exhaust stack, which may be needed to employ the WLS technology, and it does not include the possible additional cost for the equipment relocation on site due to the limited space available for the WLS system.

The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition. Some of the factors have been scaled, as indicated, based on the construction being a retrofit, rather than Greenfield, and company knowledge of the actual cost of similar size/type projects.

Two factors that significantly increase the cost of this technology are the need to reheat the exhaust gas and the cost of sludge disposal.

Exhaust Gas Reheat

A common concern of utilizing a wet scrubber on a cement kiln exhaust gas is the probable formation of a detached plume resulting in opacity violations. For a typical cement kiln stack, if the exhaust gas contains NH_3, HCl, and SO_2, sub-micron aerosols of NH_4Cl and $(NH_4)2SO_4$ may form when the gas temperature is reduced after exiting the stack. A detached plume is predicted to occur when the exhaust gas is cooled to the dew point at or near the exit of the stack and prior to the dilution of the aerosol forming constituents. The wet scrubber requires the exhaust gas to be cooled to the dew point at the inlet of the scrubber. As the temperature of the exhaust gas is cooled in the scrubber, a visible plume condition is nearly assured. The sub-micron NH_4Cl aerosol will be formed and is difficult to remove in the scrubber. This problem has been reported for wet scrubbers used at cement plants. As the plant is subject to a 20 percent opacity limitation from both the PCMACT and HWCMACT, even a small increase in opacity could lead to an exceedance of the standard, which is not acceptable. Based on information from Holcim's Dundee, Michigan plant, Holcim anticipates that the temperature of the exhaust gas at the exit of the scrubber would be approximately 170 deg F. To keep the sub-micron particles from forming at the exit of the stack, reheating the exhaust gas, after the scrubber, is required. Without having any data to determine an optimum outlet temperature for the stack gas (after a scrubber is installed), Holcim has conservatively determined that to counteract this effect, the exhaust gas would need to be reheated to the current gas temperature after the ESP of approximately 380 deg F. This re-heating would most likely be achieved using natural gas combustion. The natural gas combustion would lead to a 97 ton/year increase in NO_x emissions that would negatively impact visibility gains from the SO_2 reduction.

Sludge Disposal

The sludge generated from the WLS system may require disposal. Therefore, Holcim has determined the cost of disposal based on a bid from Area Disposal Services, Inc. for the disposal fee ($36/ton), as well as the cost for trailer rental ($120/month) and transportation ($220/load).

WLS may also lead to an increase in PM emissions because some particles of limestone or $CaSO_3$ will be entrained in the flue gas and subsequently be emitted from the scrubber. WLS is also known to increase emissions of sulfuric acid mist.[7]

TABLE 4-4. COST ANALYSIS SUMMARY FOR WET LIME SCRUBBING

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant* Removed (tons/yr)	Cost** Effectiveness ($/ton)	Cost*** Impact ($/ton clinker)
WLS – PA	80%	$24,706,548	11,481	8,726	$2,863	$20
WLS – PA	95%	$25,246,115	11,481	10,362	$2,460	$21
WLS – PTE	80%	$25,161,975	13,298	10,106	$2,514	$21
WLS – PTE	95%	$25,786,935	13,298	12,001	$2,166	$21

*Assumes 95% uptime.
**Includes 97 tons of NOx generated.
***Based on a maximum historical actual clinker production rate of 1,215,708 tons/year.

The significant increases in cost per ton of clinker produced from using WLS, as shown in Table 4-4, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with WLS.

Energy Impacts

A wet scrubber requires an additional fan of considerable horsepower to move the flue gas through the scrubber. The exhaust gas reheat requirement will utilize approximately 1,000,000 MMcf/year of natural gas, which will itself lead to an increase in NOx emissions of 97 tons/yr.

Non Air-Quality Impacts

Without reheating, a frequent steam plume and/or detached plume can be expected at the discharge of the wet scrubber that would result in visual impairment in the area.

The WLS technology could generate over 50,000 tons per year of waste (sludge) that will require disposal in a landfill.

Remaining Useful Life

The remaining useful life of the kiln does not impact the annualized cost of WLS because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.4.2 FUEL SUBSTITUTION

Cost of Compliance

[7] *Innovations in Portland Cement* Manufacturing, Portland Cement Association, 2004, pg. 660 & 669

The increased cost of using low sulfur coal includes the relative increase in fuel cost as well as the cost of a new coal mill system. Low sulfur coal is harder than the current coal/coke utilized and has a lower heat content; consequently, a higher volume of coal grinding will be needed than the current mill can achieve. The increased grinding requirement would also have an additional energy requirement. A bid for a new coal mill, classifier, and mill motors, was obtained from GEBR. Pfeiffer USA Inc. Table 4-5 provides a summary of the cost effectiveness analysis related to Fuel Substitution. The detailed cost analysis table is provided in Appendix A.

The cost effectiveness analysis does not include the cost to construct any new storage or handling facilities for the low sulfur coal that may be required.

The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition. Some of the factors have been scaled, as indicated, based on the construction being a retrofit, rather than greenfield, and company knowledge of the actual cost of similar size/type projects.

TABLE 4-5. COST ANALYSIS SUMMARY FOR FUEL SUBSTITUTION

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)	Cost* Impact ($/ton clinker)
Fuel Sub – PA	40%	$27,022,178	11,481	4,592	$5,884	$22
Fuel Sub – PA	50%	$27,022,178	11,481	5,741	$4,707	$22
Fuel Sub – PTE	40%	$27,022,178	13,298	5,319	$5,080	$22
Fuel Sub – PTE	50%	$27,022,178	13,298	6,649	$4,064	$22

*Based on a maximum historical actual clinker production rate of 1,215,708 tons/year

The significant increases in cost per ton of clinker produced from using Fuel Substitution, as shown in Table 4-5, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with Fuel Substitution.

Energy Impacts

The low sulfur coal will require additional energy for grinding. The actual increase is difficult to estimate.

Non Air-Quality Impacts

None.

Remaining Useful Life

The remaining useful life of the kiln does not impact the annualized cost because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years. However, the existing coal mill would need to be replaced at a significant expense.

4.4.3 DRY LIME SCRUBBING

Cost of Compliance

The increased cost of DLS includes the cost of hydrated lime as well as the injection system and replacing the existing ESP with a new baghouse. As the DLS injection system would likely be a custom application, Holcim's engineering department has estimated that the DLS injection system equipment cost would be approximately $1,000,000. Holcim obtained a bid for retrofitting the existing ESP with a Baghouse from GE Energy. A detailed analysis has not yet been completed to determine if the retrofit will be capable of handling the additional dust loading from the DLS system.

The quantity of hydrated lime required is calculated below on a PA and PTE basis as follows:

<u>Hydrated Lime Requirement.</u>

PA Basis:

The projected actual annual emission level of SO_2 is 11,481 tons

A molar ratio of 6:1, $Ca(OH)_2$ to SO_2, is required. The $Ca(OH)_2$ required is calculated by multiplying by the ratio of molecular weights:

6 x 11,481 tons SO_2 x (74 ton $Ca(OH)_2$/ 64 SO_2) = 79,649 tons $Ca(OH)_2$

The estimated purity of the hydrated lime is 96.8 percent $Ca(OH)_2$. Consequently, the amount required is scaled as follows:

79,649 tons $Ca(OH)_2$ / 0.968 = 82,282 tons hydrated lime

PTE Basis:

The PTE annual emission level of SO_2 is 13,298 tons

A molar ratio of 6:1, $Ca(OH)_2$ to SO_2, is required. The $Ca(OH)_2$ required is calculated by multiplying by the ratio of molecular weights:

6 x 13,298 tons SO_2 x (74 ton $Ca(OH)_2$/ 64 SO_2) = 92,255 tons $Ca(OH)_2$

The estimated purity of the hydrated lime is 96.8 percent $Ca(OH)_2$. Consequently, the amount required is scaled as follows:

92,255 tons $Ca(OH)_2$ / 0.968 = 95,304 tons hydrated lime

Table 4-6 provides a summary of the cost effectiveness analysis related to DLS. The detailed cost analysis table is provided in Appendix A. The control cost factors were obtained from the EPA's Control Cost Manual, 6^{th} Edition. Some of the factors have been

scaled, as indicated, based on the construction being a retrofit, rather than greenfield, and company knowledge of the actual cost of similar size/type projects.

TABLE 4-6. COST ANALYSIS SUMMARY FOR DRY LIME SCRUBBING

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)	Cost* Impact ($/ton clinker)
DLS – PA	20%	$15,607,401	11,481	2,181	$7,155	$13
DLS – PA	30%	$15,607,401	11,481	3,272	$4,770	$13
DLS – PTE	20%	$17,638,856	13,298	2,527	$6,981	$15
DLS – PTE	30%	$17,638,856	13,298	3,790	$4,654	$15

*Based on a maximum historical actual clinker production rate of 1,215,708 tons/year

The significant increases in cost per ton of clinker produced from using DLS, as shown in Table 4-6, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with DLS.

Energy Impacts
Additional electricity is needed for the pump used to inject the lime into the kiln gas.

Non Air-Quality Impacts
Utilizing DLS could also increase the amount of CKD sent to the landfill.

Remaining Useful Life
The remaining useful life of the kiln does not impact the annualized cost because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.5 EVALUATION OF VISIBILITY IMPACT OF FEASIBLE SO_2 CONTROLS

A final impact analysis was conducted to assess the visibility improvement for the existing emission rate when compared to the emission rate of WLS, Fuel Substitution, and DLS. The existing emission rates, and emission rates associated with controls, were modeled using CALPUFF. The existing emission rate is the same rate that was modeled for the BART applicability analysis. The SO_2 emission rate associated with WLS, Fuel Substitution, and DLS is the existing emission rates less the average anticipated control of 87.5 percent, 45 percent, and 25 percent respectively. The emission rates are summarized in Table 4-7.

TABLE 4-7. SUMMARY OF EMISSION RATES MODELED IN SO_2 CONTROL VISIBILITY IMPACT ANALYSIS

Emission Rate Scenario	Emission Rate		
	SO_2 (lb/hr)	NO_X (lb/hr)	PM_{10} (lb/hr)
WLS – 87.5%	611	3,049	51.82
Fuel Substitution – 45%	2,689	3,049	51.82
DLS – 25%	3,667	3,049	51.82
Base case – Max 24-hr avg.	4,889	3,049	51.82

Comparisons of the existing visibility impacts and the visibility impacts based on WLS, Fuel Substitution, and DLS are provided in Table 4-8. The visibility improvement associated with the controls are also shown in Table 4-8; this value was calculated as the difference between the existing visibility impairment and the visibility impairment for the controlled emission rates as measured by the 98th percentile modeled visibility impact.

TABLE 4-8. SUMMARY OF MODELED IMPACTS FROM SO_2 CONTROL VISIBILITY IMPACT ANALYSIS

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
WLS 98% Impact (Δdv)	0.48	0.31	0.21
WLS Improvement 98% Impact (Δdv)	0.53	0.50	0.40
Fuel Subs. 98% Impact (Δdv)	0.70	0.58	0.37
Fuel Subs Improvement 98% Impact (Δdv)	0.31	0.23	0.24
DLS 98% Impact (Δdv)	0.87	0.70	0.48
DLS Improvement 98% Impact (Δdv)	0.14	0.11	0.13

4.6 PROPOSED BART FOR SO_2

In order to determine BART for SO_2, Holcim reviewed each control option's availability, as well as its cost of compliance, energy impacts, and non-air quality impacts, as well as the remaining useful life of the kiln. Table 4-9 summarizes the cost effectiveness for the controls based on the tons of SO_2 reduced and the visibility improvement in deciviews.

TABLE 4-9. SUMMARY OF COST EFFECTIVENESS OF SO_2 CONTROL OPTIONS

Control Option*	Existing Emissions (tons/yr)	Reduced Annual Emissions (tons/yr)	Annual Cost ($/yr)	Cost** Effectiveness ($/ton)	Cost Impact ($/ton clinker)
WLS–PA–80%	11,481	8,726	$24,706,548	$2,863	$20
Fuel Sub – PA - 40%	11,481	4,592	$27,022,178	$5,884	$22
DLS – PA - 20%	11,481	2,181	$15,607,401	$7,155	$13

*The worst case scenario from a cost effectiveness perspective is provided.

**Includes 97 tons of NOx generated for WLS

Control Type **WLS–PA–80%** Class I Area	Base 98th Percentile Impact (DV)	Controlled 98th Percentile Impact (DV)	98th Percentile Improvement (DV)	98th Percentile Improvement (%)	Cost Effectiveness ($/DV)
Mingo	1.01	0.48	0.53	52.5	$46,616,128
Hercules	0.81	0.31	0.50	61.7	$49,413,096
Buffalo	0.61	0.21	0.40	65.6	$61,766,370

Control Type **Fuel Subs.** Class I Area	Base 98th Percentile Impact (DV)	Controlled 98th Percentile Impact (DV)	98th Percentile Improvement (DV)	98th Percentile Improvement (%)	Cost Effectiveness ($/DV)
Mingo	1.01	0.70	0.31	30.7	$87,168,317
Hercules	0.81	0.58	0.23	28.4	$117,487,732
Buffalo	0.61	0.37	0.24	39.3	$112,592,410

Control Type **DLS** Class I Area	Base 98th Percentile Impact (DV)	Controlled 98th Percentile Impact (DV)	98th Percentile Improvement (DV)	98th Percentile Improvement (%)	Cost Effectiveness ($/DV)
Mingo	1.01	0.87	0.14	13.9	$111,481,434
Hercules	0.81	0.70	0.11	13.6	$141,885,461
Buffalo	0.61	0.48	0.13	21.3	$120,056,929

Based on the five step analysis outlined by EPA, this analysis demonstrates that the cost of compliance associated with WLS, Fuel Substitution, and DLS is extremely high on a $/ton of SO_2 removed basis, and especially on a $/DV of improvement basis. A cost range of $46 million - $141 million/DV is well beyond expectations of the BART program. Holcim has concluded that the current inherent scrubbing by the cement kiln process is the only feasible control and no additional BART control option is economically feasible. Notwithstanding, Holcim has been diligently working on capturing SO_3 in clinker and significantly increased SO3 in the clinker in the past five years. Holcim continues to work on process optimization to further increase the SO_3 capture in the clinker.

5. NO_X BART EVALUATION

In Portland cement kilns, the NO_X that is generated is primarily classified into one of two categories, i.e., thermal NO_X or fuel NO_X[8]. Thermal NO_X occurs as a result of the high-temperature oxidation of molecular nitrogen present in the combustion air. Fuel NO_X is created by the oxidation of nitrogenous compounds present in the fuel. It is also possible for nitrogenous compounds to be present in the raw material feed and become oxidized to form additional NO_X referred to as feed NO_X.

Due to the high flame temperature in the burning zone of the rotary kiln (3400^o F), NO_X emissions from the kiln tend to be mainly comprised of thermal NO_X. Although NO_X emissions from cement kilns include both nitrogen oxide (NO) and nitrogen dioxide (NO_2), typically, less than 10% of the total NO_X in the flue gas is NO_2.[9]

The kiln is the only BART source which emits NO_x, thus a NO_x BART evaluation was performed only for the kiln. The maximum actual 24-hour kiln NO_x emission rate that was modeled for the BART applicability determination is summarized in Table 4-1. The NO_x 24-hour maximum actual emission rate was determined from analyzer data for November 24, 2007.

TABLE 5-1. EXISTING ACTUAL MAXIMUM 24-HOUR NO_x EMISSION RATES

	NO_x 24-Hour Emission Rate ton/24-hr	NO_x Hourly Equivalent Emission Rate lb/hr
Kiln	36.59 (73,185 lbs)	3,049

5.1 IDENTIFICATION OF AVAILABLE RETROFIT NO_X CONTROL TECHNOLOGIES

Step 1 of the BART determination is the identification of all available retrofit NO_X control technologies. A list of control technologies was obtained by reviewing the U.S. EPA's Clean Air Technology Center, control equipment vendor information, publicly-available air permits, applications, and technical literature published by the U.S. EPA and the RPOs.

The available retrofit NO_X control technologies are summarized in Table 5-2.

[8] NO_X Formation and Variability in Portland Cement Kiln Systems, Penta Engineering, December 1998.

[9] IBID.

TABLE 5-2. POSSIBLE NO_X CONTROL TECHNOLOGIES

Kiln Control Technologies
Low NO_X Burner Flue Gas Recirculation CKD Insufflation Mid-Kiln Firing of Tires Selective Noncatalytic Reduction Selective Catalytic Reduction

5.2 ELIMINATE TECHNICALLY INFEASIBLE NO_X CONTROL TECHNOLOGIES

Step 2 of the BART determination is to eliminate technically infeasible NO_X control technologies that were identified in Step 1.

5.2.1 LOW-NO_X BURNER IN THE ROTARY KILN

Low NO_x burners (LNBs) reduce the amount of NO_x formed at the flame. The principle of all LNBs is the same: stepwise or staged combustion and localized exhaust gas recirculation (i.e. at the flame). As applied to the rotary cement kiln, the low-NO_X burner creates primary and secondary combustion zones at the end of the main burner pipe to reduce the amount of NO_x initially formed at the flame. In the high-temperature primary zone, combustion is initiated in a fuel-rich environment in the presence of a less than stoichiometric oxygen concentration. The oxygen-deficient condition at the primary combustion site minimizes thermal and fuel NO_X formation and produces free radicals that chemically reduce some of the NO_X that is being generated in the flame.

In the secondary zone, combustion is completed in an oxygen-rich environment. The temperature in the secondary combustion zone is much lower than in the first; therefore, lower NO_X formation is achieved as combustion is completed. CO that has been generated in the primary combustion zone as an artifact of the sub-stoichiometric combustion is fully oxidized in the secondary combustion zone.

Low-NO_X burners are considered to be a technically feasible option for NO_X control. As Holcim already has a LNB, the technology will not be considered further.

5.2.2 FLUE GAS RECIRCULATION

Flue gas recirculation involves the use of oxygen-deficient flue gas from some point in the process as a substitute for primary air in the main burner pipe in the rotary kiln. Flue gas recirculation (FGR) lowers the peak flame temperature and develops localized reducing conditions in the burning zone through a significant reduction of the oxygen content of the primary combustion “air.” The intended effect of the lower flame temperature and reducing conditions in the flame is to decrease both thermal and fuel NO_X formation in the rotary kiln.

While FGR is a practiced control technology in the electric utility industry, Holcim is not aware of any attempt to apply FGR to a cement kiln because of the unique process requirements of the industry, i.e., a hot flame is required to complete the chemical reactions that form clinker minerals from the raw materials. The process of producing clinker in a cement kiln requires the heating of raw materials to about 2700°F for a brief but appropriate time to allow the desired chemical reactions that form the clinker minerals to occur. A short, high-temperature flame of about 3400°F is necessary to meet this process requirement. The long/lazy flame that would be produced by FGR would result in the production of lower or unacceptable quality clinker because of the resulting undesirable mineralogy. Clinkering reactions must take place in an oxidizing atmosphere in the burning zone to generate clinker that can be used to produce acceptable cement. FGR would tend to produce localized or general reducing conditions that also could detrimentally affect clinker quality. Due to these important limitations on the application of FGR and the lack of a successful demonstration on a cement kiln in the United States, FGR is not a technically feasible control option for NO_X control at this time.

5.2.3 CEMENT KILN DUST INSUFFLATION

Cement kiln dust (CKD) is a residual byproduct that can be produced by any of the four basic types of cement kiln systems. CKD is most often treated as a waste even though there are some beneficial uses. However, as a means of recycling usable CKD to the cement pyroprocess, CKD sometimes is injected or insufflated into the burning zone of the rotary kiln in or near the main flame. The presence of these cold solids within or in close proximity to the flame has the effect of cooling the flame and/or the burning zone thereby reducing the formation of thermal NO_X. The insufflation process is somewhat counterintuitive because a basic requirement of a cement kiln is a very hot flame to heat the clinkering raw materials to about 2700^{o} F in as short a time as possible. The Clarksville plant already uses this technology and it is already included in the baseline. Therefore, this option is removed from consideration for BART.

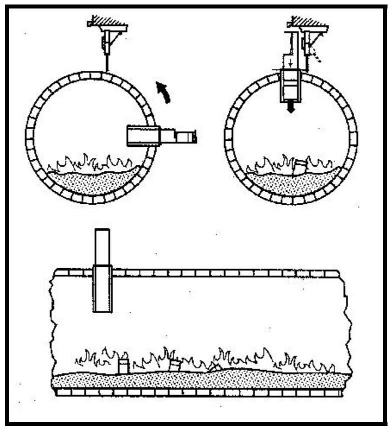
5.2.4 MID-KILN FIRING OF SOLID FUEL WITH MIXING AIR FAN

Secondary combustion is defined as follows: a portion of the fuel is fired in a location other than the burning zone. This reduces thermal NO_x generation because the temperature in the secondary combustion zone is less than 2100 °F. Mid-kiln firing (MKF) of solid fuels is an example of secondary combustion and includes fuels such as used tires, oil filter fluff, plastics, spent activated carbon and carbon black, asphalt shingles, diaper manufacturing waste, and other combustible solids. MKF improves clinker process energy efficiency, allows for greater operational flexibility with respect to fuel types, and is currently listed as a NOx control technology in 10 CSR 10-6.380 Control of NOx Emissions from Portland Cement Kilns.

An example of a MKF system is the Cadence feed form MKF technology which was first introduced in 1989. It is comprised of three primary components: (1) a staging arm or "feed fork," that picks up the fuel modules and positions them for entry into the kiln, (2) two pivoting doors that open to allow the fuel to drop into the kiln, and (3) a drop tube that

extends through the side wall of the kiln. In addition to these basic components, feed fork technology also requires a delivery system which positions the fuel models so they can be picked up by the feed fork and a mechanism for opening the doors so the fuel can enter the kiln. Due to rotation of the kiln, fuel can only be injected once per revolution from the top, as shown in Figure 5-1.

FIGURE 5-1. MID-KILN FIRING SCHEMATIC[10]



High-pressure air, in the range of a 2-10 percent replacement of the primary combustion air, could be injected through the shell of the rotary kiln and into the calcining zone to where a mixing air fan mixes the air with the gas and fuel within the rotary kiln for more complete combustion of the solid fuel.

By adding fuel mid-kiln, MKF changes both the flame temperature and flame length. These changes should reduce thermal NO_X formation by burning part of the fuel at a lower temperature and by creating reducing conditions at the mid-kiln fuel injection point which may destroy some of the NO_X formed upstream in the kiln burning zone.

Clarksville has the largest long kiln in the world. The kiln has a 7 meter diameter and a very high thermal capacity. Using whole tires to replace 10% of total fuel consumption will require four whole tires being fed to the mid-kiln door per kiln revolution, 12% fuel replacement would require 5 tires per revolution. The maximum tire feed rate per revolution that Holcim is aware of, on similar applications, is three tires per revolution. Holcim is concerned that the greater the number of tires fed per revolution, on a continuous basis, the greater the potential for process upsets from unstable feeding. Holcim has found that kilns being fed even one to three tires per revolution can have problems with stable, uniform feeding. In addition, if too many tires burn at the bottom of the kiln, a high local temperature could result which would disturb the normal operation of the kiln and potentially increase NOx. Further, due to the large kiln diameter, the reducing zone created by burning tires may only impact a small cross section of the entire cross section of the kiln, thus having less of an overall reduction in NOx than anticipated.

[10] NO_X Control Technologies for the Cement Industry, EC/R Incorporated, Chapel Hill, NC, USA, U.S. EPA Contract NO. 68-D98-025, U.S. EPA RTP, September 19, 2000.

In an effort to better understand these uncertainties, Holcim hired CINAR Company, the expert in this field, to conduct modeling of the system and to predict NOx reduction. Their study predicted that a 15% NOx reduction would occur at 10% replacement (replace 10% of the current fuel with tires) and 27% NOx reduction for 15% replacement.

To then determine the thermal substitution rate (TSR) of tires that the Clarksville plant is capable of utilizing, three additional factors must be considered:

1. Tire availability. The local market only has sustainable resources of 10-12% TSR;
2. Tire feeding limit: 12% TSR equates to five tires being fed per revolution.
3. The thermal stability of operation in a large kiln. 15% TSR is predicted to be the maximum for short term periods, whereas 10-12% TSR is predicted to be achievable on a long term basis.

Based on the lack of experience using MKF of tires on kilns the size of Clarksville, Holcim is relying on the computer modeling (regardless of the general uncertainty that exists with computer models) to estimate the NOx reduction. Holcim anticipates that MKF of tires may achieve up to 20% percent NOx reduction at a TSR of 12 percent on a long term basis.

MKF is considered to be a technically feasible option for NOx control. Further, Holcim has already received a construction permit that would allow the installation of MKF, whereas other technologies would require a new construction permit application process, the result of which is unknown.

5.2.5 SELECTIVE NONCATALYTIC REDUCTION

In the relatively narrow temperature window of 1600 to 1995°F, ammonia (NH_3) reacts with NO_x without the need for a catalyst to form water and molecular nitrogen in accordance with the following simplified reactions.

$4NO + 4NH_3 + O_2 \rightarrow 4N_2 + 6H_2O$
$2NO_2 + 4NH_3 + O_2 \rightarrow 3N_2 + 6H_2O$

As applied to NO_x control from cement kilns and other combustion sources, this technology is called selective noncatalytic reduction (SNCR). Above this temperature range, the NH_3 is oxidized to NO_x thereby increasing NO_x emissions. Below this temperature range, the reaction rate is too slow for completion and unreacted NH_3 may be emitted from the pyroprocess. This temperature window generally is available at some location within the rotary kiln. The NH_3 could be delivered to the kiln shell through the use of anhydrous NH_3, or an aqueous solution of NH_3 (ammonium hydroxide) or urea.

A concern about application of SNCR technology is the breakthrough of unreacted NH_3 as "ammonia slip" and its subsequent reaction in the atmosphere with SO_2, sulfur trioxide (SO_3), hydrogen chloride (HCl) and/or chlorine (Cl_2) to form a detached plume of sub-

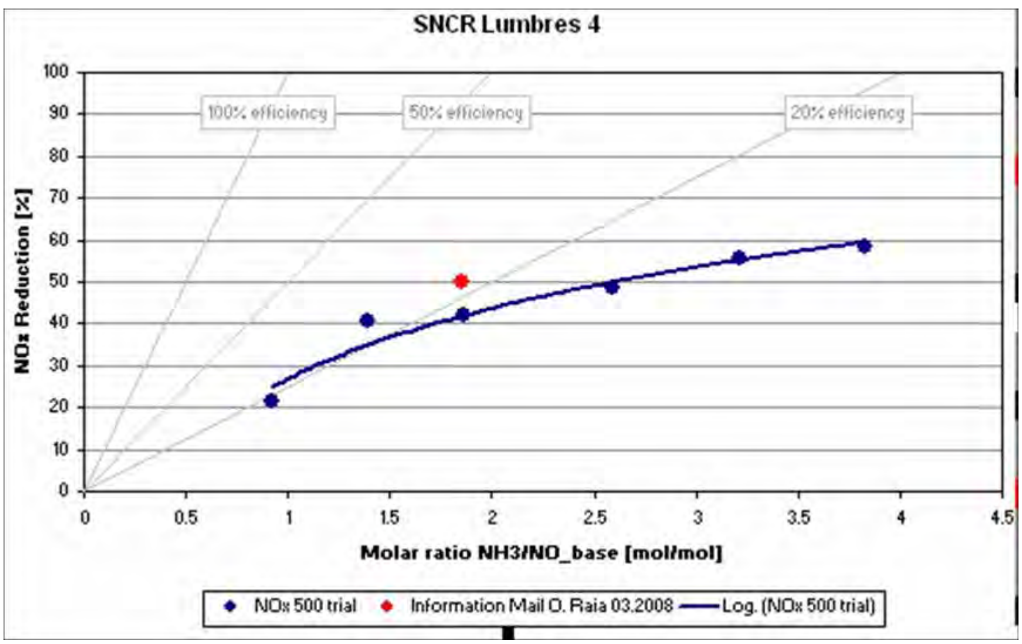
micron particles. As NH_3 or Urea injection rates are increased, to attempt to achieve higher levels of reduction, NH_3 emission levels are increased.

Industry Experience

Ash Grove Cement Company installed a full scale SNCR system on one of its wet kilns in Midlothian, Texas. Ash Grove has reported that it is achieving a 35 to 40% NOx reduction; however, as this application has just started, no data is available to verify this reduction is being achieved or on what averaging period or the long term sustainability.[11]

Holcim's wet plant in Lumbres, France utilizes SNCR. It is the earliest application of SNCR on a long kiln in the world and has been running for multiple years. The plant has found that NH_3 slip increases as the urea injection rate increases especially when the molar ratio is more than 1.0 (i.e. the NH_3 added is more than needed for the reaction). At this level, significant amounts of NH_3 are unreacted. The plant reports achieving 20 percent NOx reduction at a 1.0 molar ratio of NH_3/NOx and 40 percent at a molar ratio of 1.5 as shown in Figure 5-2.

FIGURE 5-2. NOX REDUCTION VERSUS NH3 MOLAR RATIO OBSERVED AT HOLCIM LUMBRES PLANT.



However, at 20 percent NOx reduction, the NH_3 slip is reported to be 10 mg/m3, while at 40 percent reduction, the NH_3 slip can be 20 – 30 mg/m^3 (a 50 percent to 100 percent increase). Based on experiences at many cement plants with SO_2 and HCl in the exhaust gas, which is also the case for the Clarksville plant, a 20 mg/Nm3 NH_3 increase would cause a severe increase in plume visibility. The Lumbres plant is also smaller than

[11] BART Five Factor Analysis. Ash Grove Cement Company Montana City, Montana. Dated June 2007. Page 5-9.

Clarksville, having a diameter of only 3.3 meters versus Clarksville's 7 meter diameter kiln. The larger diameter of Clarksville's kiln would make distribution of the reagent across the kiln more difficult, and would reduce the effectiveness to an unknown degree.

Based on the concerns with NH_3 slip at high molar ratios, and the uncertainty regarding the level of effectiveness of the reagent in Clarksville's large diameter kiln, Holcim anticipates that at a molar ratio of about 1.0, an average annual control efficiency of 20 percent could likely be achieved without excessive NH_3 slip. However, a pilot study would need to be conducted to verify this. Regardless, SNCR is considered to be a technically feasible option for NO_X control.

5.2.6 SELECTIVE CATALYTIC REDUCTION

Selective Catalytic Reduction (SCR) is an add-on control technology for the control of emissions of the oxides of nitrogen (NO_x) from a combustion process. SCR has been successfully employed in the electric power industry. The basic SCR system consists of a system of catalyst grids placed in series with each other within a vessel that is located in a part of the process where the normal flue gas temperature is in the required range. An ammonia-containing reagent is injected at a controlled rate upstream of the catalyst grids that are designed to ensure relatively even flue gas distribution within the grids, to provide good mixing of the reagent and flue gas, and to result in minimum ammonia (NH_3) slip.[12] The NH_3 reacts with NO_x compounds (i.e., NO and NO_2) on the surface of the catalyst in equal molar amounts (i.e., one molecule of NH_3 reacts with one molecule of NO_x). Common reagents include aqueous NH_3, anhydrous NH_3 and urea [$(NH_2)_2CO$]. In the presence of the catalyst, the injected ammonia is converted by OH^- radicals to ammonia radicals (i.e., NH_2^-), which, in turn, react with NO_x to form N_2 and H_2O. The SCR catalyst enables the necessary reactions to occur at lower temperatures than those required for Selective Non-Catalytic Reduction (SNCR). While catalysts can be effective over a larger range of temperatures, the optimal temperature range for SCR is 570 - 750º F.

The catalyst system used in SCR applications usually consists of (1) a porous honeycomb of a ceramic substrate onto which catalyst has been attached to the surface of the ceramic material, or (2) a flat or corrugated plate onto which catalytic material has been deposited on the surface. A porous metal oxide with a high surface area-to-volume ratio acts as a catalyst base. On this base, typically titanium dioxide (TiO_2), one or more metal oxide catalysts are deposited in various concentrations. In SCR applications, the active catalyst material typically consists of vanadium pentoxide (V_2O_5), tungsten trioxide (WO_3), and molybdenum trioxide (MoO_3) in various combinations. The composition, also known as the catalyst formulation, is tailored by the catalyst vendor to best suit a particular SCR application. Catalyst deactivation through poisoning, fouling, masking, sintering and erosion are common problems for SCR catalysts that, without careful process design and operation, could be exacerbated. If not fouled by sulfur dioxide (SO_2), the catalysts used in SCR have a propensity to oxidize sulfur dioxide (SO_2) in the flue gas to sulfur trioxide (SO_3), a more undesirable pollutant.

[12] Slip refers to the quantity of unreacted reagent that exits the SCR reactor.

Because the reaction rate of NH_3 and NO_X is temperature dependent, the temperature of the flue gas stream to be controlled is the most important consideration in applying SCR technology to any combustion source. The optimum temperature range for SCR application is about 300º C (570º F) to 450º C (840º F). This range of normal process temperature would occur within the kiln of a long wet kiln, rather than in the exhaust gas between the wet kiln and the PMCD inlet.

SCR has not been applied to any wet cement plant in the world and is not considered an available technology.

As explained in more detail below, a technology is considered "available" if it can be obtained by the applicant through commercial channels or is otherwise available within the common sense meaning of the term. An available technology is “applicable” if it can reasonably be installed and operated on the source type under consideration. A technology that is available and applicable is technically feasible. Availability in this context is further explained using the following process commonly used for bringing a control technology concept to reality as a commercial product: concept stage; research and patenting; bench scale or laboratory testing; pilot scale testing; licensing and commercial demonstration; and Commercial sales.

A control technique is considered available, within the context presented above, if it has reached the licensing and commercial sales stage of development. A source would not be required to experience extended time delays or resource penalties to allow research to be conducted on a new technique. Neither is it expected that an applicant would be required to experience extended trials to learn how to apply a technology on a totally new and dissimilar source type. Consequently, technologies in the pilot scale testing stages of development would not be considered available. An exception would be if the technology were proposed and permitted under the qualifications of an innovative control device consistent with the provisions of 40 CFR 52.21(v) or, where appropriate, the applicable SIP [in which case it would be considered available].

Therefore, SCR is eliminated from further consideration as BART for NO_x control at the Clarksville plant.

.

5.3 RANK OF TECHNICALLY FEASIBLE NO_X CONTROL OPTIONS BY EFFECTIVENESS

The third step in the BART analysis is to rank the technically feasible options according to effectiveness. Table 5-3 presents potential NO_X technically feasible control technologies by effectiveness.

TABLE 5-3. RANKING OF TECHNICALLY FEASIBLE KILN NO_X CONTROL TECHNOLOGIES BY EFFECTIVENESS

Control Technology	Effectiveness NO_X Emissions Level (%)
MKF	20%
SNCR	20%
LNB, CKD Insufflation, and Synfuel	Already utilized at Clarksville

5.4 EVALUATION OF IMPACTS FOR FEASIBLE NO_X CONTROLS

Step four for the BART analysis procedure is the impact analysis. The BART determination guidelines list four factors to be considered in the impact analysis:

- Cost of compliance
- Energy impacts
- Non-air quality impacts; and
- The remaining useful life of the source

5.4.1 MKF

Cost of Compliance

Holcim anticipates that MKF and SNCR have relatively the same level of effectiveness. Because SNCR would require a pilot study to prove or verify the effectiveness of NOx reduction, Holcim is accepting the use of MKF as BART. As Holcim is accepting the most stringent control option available as BART, the cost of compliance is not required to be evaluated.

Energy Impacts and Non Air-Quality Impacts

There are no known adverse energy or non-air impacts from MKF. MKF of tires has the benefit of eliminating tires from landfills and illegal dumping. It also reduces CO_2 emissions (a Green House Gas) and reduces fossil fuel use.

Remaining Useful Life

The remaining useful life of the kiln does not impact the annualized costs of MKF because the useful life is anticipated to be at least as long as the capital cost recovery period, which would be 15 years.

5.5 EVALUATION OF VISIBILITY IMPACT OF FEASIBLE NO_X CONTROLS

The final impact analysis was conducted to assess the visibility improvement for existing emission rates when compared to the emission rate with MKF. The existing emission rates and emission rates associated with MKF were modeled using CALPUFF. The existing emission rates are the same rates that were modeled for the BART applicability analysis. The NO_x emission rate associated with MKF

was the existing emission rate less an average reduction of 20 percent. The emission rate is summarized in Table 5-4.

TABLE 5-4. SUMMARY OF EMISSION RATES MODELED IN NO_X CONTROL VISIBILITY IMPACT ANALYSIS

Emission Rate Scenario	Emission Rate SO_2 (lb/hr)	 NO_X (lb/hr)	 PM_{10} (lb/hr)
MKF,	4,889	2,440	51.82
Base case – High 24 hr average	4,889	3,049	51.82

Comparisons of the 98th percentile existing visibility impacts and the visibility impacts based on MKF are provided in Table 5-5. The visibility improvement associated with MKF are also shown in Table 5-5; this was calculated as the difference between the existing visibility impairment and the visibility impairment for the remaining control options as measured by the 98th percentile modeled visibility impact.

TABLE 5-5. NO_X CONTROL VISIBILITY IMPACT ANALYSIS

	Existing 98% Impact (Δdv)	MKF 98% Impact (Δdv)	Improvement
Mingo	1.01	0.92	8.9%
Hercules	0.81	0.72	11.1%
Upper Buffalo	0.61	0.60	1.6%

As seen in Tables 5-5, the MKF option results in a visibility improvement of up to 11.1 percent in the Hercules Glades Class I area.

5.6 PROPOSED BART FOR NO_X

Based on the five step analysis outlined by EPA, MKF was identified as the highest ranking feasible add-on control technology. Energy and environmental impacts were assessed for this technology and the visibility improvements were evaluated against existing conditions. Consistent with EPA guidance, economic impacts were not assessed as Holcim was willing to utilize the highest ranked control technology. The visibility impact analysis demonstrates that the utilization of MKF to achieve a 2,440 lb/hr NO_x emission rate results in up to an 11.1 percent visibility improvement. Neither non-air quality nor energy impacts associated with this control technology eliminate it in favor of retaining the existing rates as BART.

Holcim has determined that BART for the facility is MKF. Based on the lack of site specific, or significant industry data, for the use of this technology on wet cement kilns, it is possible that Holcim will further evaluate the MKF system and determine that MKF results in limited or no additional benefit. In the future, an alternative technology or methodology may become feasible and could be implemented as needed. Holcim will continue to utilize the NOx controls that are already in place, including LNB, insufflation, and the use of alternative fuels as available.

Appendix A. Control Cost Tables

Table A-1. Wet Limestone Scrubber Control Cost Analysis Based on Projected Actual Emissions and 80% Control.

Direct Costs			
Purchased Equipment Costs			
	Wet Scrubber Unit including Limestone Prep System		$10,524,352
	Instrumentation (15% of EC)		$1,578,653
	Sales Tax (5% of EC)		$526,218
	Freight (5% of EC)		$526,218
		Subtotal, Purchased Equipment Cost (PEC)	$13,155,441
Direct Installation Costs			
	Foundation (10% of PEC)		$1,315,544
	Supports (10% of PEC)		$1,315,544
	Handling and Erection (50% of PEC)		$6,577,720
	Electrical (10% of PEC)		$1,315,544
	Piping (30% of PEC)		$3,946,632
	Extending gas line 1/2 mile to plant		$500,000

Indirect Annual Costs			
Overhead (60% of sum of operating, supervisor, maintenance labor & materials)			$2,091,012
Administrative (2% TCI)			$688,821
Property Tax (1% TCI)			$344,410
Insurance (1% TCI)			$344,410
Capital Recovery	(15 year life, 7 percent interest)		$3,781,441
		Total Indirect Annual Cost	**$7,250,094**
Conclusion			
	Total Annualized Cost		**$25,786,935**
	Pollutant Emission Rate Prior to Scrubber (tons SO_2/yr) - PTE		**13,298**
	Pollutant Removed (tons SO_2/yr) - 95%, 95% uptime		**12,001**
	Pollutant Generated - NOx tons/yr		**97**
	Net Pollutant Removed - tons/yr		**11,904**
	Cost Per Ton of Pollutant Removed		**$2,166**

Table A-5. Fuel Substitution Control Cost Analysis Based on Projected Actual Emissions and 40% Control .

Direct Costs			
Purchased Equipment Costs			
	New Coal Mill and associated equipment		$3,864,000
	Instrumentation (15% of EC)		$579,600
	Sales Tax (5% of EC)		$193,200
	Freight (5% of EC)		$193,200
		Subtotal, Purchased Equipment Cost (PEC)	$4,830,000
Direct Installation Costs			
	Foundation (10% of PEC)		$483,000
	Supports (10% of PEC)		$483,000
	Handling and Erection (50% of PEC)		$2,415,000
	Electrical (10% of PEC)		$483,000
	Piping (30% of PEC)		$1,449,000
	Insulation for Ductwork (5% of PEC)		$9,660
	Painting (1% of PEC)		$48,300
		Subtotal, Direct Installation Cost	$5,370,960
Site Preparation			N/A
Buildings			N/A
		Total Direct Cost	**$10,200,960**
Indirect Costs			
	Engineering (10% of PEC)		$483,000
	Construction and Field Expense (15% of PEC)		$724,500
	Contractor Fees (10% of PEC)		$483,000
	Start-up (1% of PEC)		$48,300
	Performance Test (1% of PEC)		$48,300
	Contingencies (5% of PEC)		$241,500
		Total Indirect Cost	**$2,028,600**
	Total Capital Investment (TCI)		**$12,229,560**
Direct Annual Costs			
Increased Fuel Cost (calculated by scaling 2007 annual average fuel usage by the ratio of maximum annual clinker production (1,215,708 tons) to 2007 actual clinker production (1,035,283 tons)			
	Reduction in coke usage (metric ton/yr)		188,959
	Heat Value (Gj / Mt)		32.510
	Heat (Gj / yr)		6,143,045
	Cost ($/Gj)		$1.74
		Subtotal, reduction in coke cost	-$10,688,898
	Reduction in coal usage (metric ton/yr)		11,076

Property Tax (1% TCI)			$126,600
Insurance (1% TCI)			$126,600
Capital Recovery	(15 year life, 7 percent interest)		$1,390,000
		Total Indirect Annual Cost	**$2,224,500**
Conclusion			
	Total Annualized Cost		**$17,638,856**
	Pollutant Emission Rate Prior to Scrubber (tons SO_2/yr)		**13,298**
	Pollutant Removed (tons SO_2/yr) - 20% removal, 95% uptime		**2,527**
	Cost Per Ton of Pollutant Removed		**$6,981**

Table A-12. Dry Lime Scrubbing - Control Cost Analysis Based on PTE and 30% Control.

Direct Costs			
Purchased Equipment Costs			
	Dry Lime Injection System		$1,000,000
	Retrofit ESPs with Baghouse		$3,000,000
	Total Equipment Cost		$4,000,000
	Instrumentation (15% of EC)		$600,000
	Sales Tax (5% of EC)		$200,000
	Freight (5% of EC)		$200,000
		Subtotal, Purchased Equipment Cost (PEC)	$5,000,000
Direct Installation Costs			
	Foundation (10% of PEC)		$500,000
	Supports (10% of PEC)		$500,000
	Handling and Erection (50% of PEC)		$2,500,000
	Electrical (10% of PEC)		$500,000
	Piping (30% of PEC)		$1,500,000
	Insulation for Ductwork (5% of PEC)		$10,000
	Painting (1% of PEC)		$50,000
		Subtotal, Direct Installation Cost	$5,560,000
Site Preparation			N/A
Buildings			N/A
		Total Direct Cost	**$10,560,000**
Indirect Costs			
	Engineering (10% of PEC)		$500,000
	Construction and Field Expense (15% of PEC)		$750,000
	Contractor Fees (10% of PEC)		$500,000
	Start-up (1% of PEC)		$50,000
	Performance Test (1% of PEC)		$50,000
	Contingencies (5% of PEC)		$250,000
		Total Indirect Cost	**$2,100,000**
	Total Capital Investment (TCI)		**$12,660,000**
Direct Annual Costs			
Operating Labor			
	Operator (0.5 hr/shift, 3 shifts/day, 365 d/yr, $16/hr)		$8,760
	Supervisor (15% of operator)		$1,314
		Subtotal, Operating Labor	$10,074
Maintenance			
	Labor (0.5 hr/shift, 3 shifts/day, 365 d/yr, $16/hr)		$8,760
	Material (5% of Total Direct Cost). Increased to account for high rate of damaged bags that is expected.		$ 528,000
		Subtotal, Maintenance	$536,760
Lime			
	Hydrated lime/Sulfur molar ratio, min. Ca/S		6.0
	MW of Ca(OH)2		74
	MW of SO2		64
	Purity of the Comercial lime %		96.8
	Lime Required - Short Tons		95305
	Cost ($/short ton)		$ 156.00
		Subtotal, Lime	$14,867,521
		Total Direct Annual Costs	**$15,414,355**
Indirect Annual Costs			
Overhead (60% of sum of operating, supervisor, maintenance labor & materials)			$328,100
Administrative (2% TCI)			$253,200
Property Tax (1% TCI)			$126,600
Insurance (1% TCI)			$126,600
Capital Recovery	(15 year life, 7 percent interest)		$1,390,000
		Total Indirect Annual Cost	**$2,224,500**
Conclusion			
	Total Annualized Cost		**$17,638,856**
	Pollutant Emission Rate Prior to Scrubber (tons SO_2/yr)		**13,298**
	Pollutant Removed (tons SO_2/yr) - 30% removal, 95% uptime		**3,790**
	Cost Per Ton of Pollutant Removed		**$4,654**

TABLE OF CONTENTS

LIST OF TABLES

1. EXECUTIVE SUMMARY

This report documents the determination of the Best Available Retrofit Technology (BART) as proposed by Holcim (US) Inc. (Holcim) for the Portland cement manufacturing plant located in Clarksville, Missouri (Clarksville plant). This analysis is for the kiln system. Currently, particulate matter emissions from the kiln are controlled by an electrostatic precipitator. The Clarksville plant has other lesser emitting BART-eligible emissions units, all of which have Particulate Matter Control Devices (PMCDs) installed. The negligible visibility impairment attributable to these sources concludes that no additional controls are necessary to satisfy the requirements of the BART rule.[1]

Holcim used the U.S. Environmental Protection Agency's (EPA's) guidelines[2] in 40 CFR Part 51 to determine BART for the kiln. Specifically, Holcim conducted a five-step analysis to determine BART for SO_2, NOX, and PM_{10} that included the following:

1. Identifying all available retrofit control technologies;
2. Eliminating technically infeasible control technologies;
3. Evaluating the control effectiveness of remaining control technologies;
4. Evaluating impacts and document the results;
5. Evaluating visibility impacts

Based on the five-step analysis, Holcim proposes the following as BART:

Kiln:

- PM_{10} – Holcim has determined that the existing electrostatic precipitator constitutes BART. This control device is effective for controlling PM_{10} from a wet kiln.

- NO_X – Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system or equivalent technologies that will achieve a 20 percent reduction in the maximum daily NO_X emission rate of 73,185 lbs that was used for visibility impact modeling.

- SO_2 – Holcim proposes that BART for the Holcim Clarksville Kiln is fuel substitution or equivalent technologies that will achieve a 23 percent reduction in the maximum daily SO_2 emission rate of 117,345 lbs that was used for visibility impact modeling.

The proposed BART control strategies will result in reductions of the visibility impacts attributable to the Clarksville plant. A summary of the visibility improvement at Class I areas based on the existing emission rates and proposed BART emission rates is provided in Table 1-1.

[1] Holcim submitted an inventory of all of the BART-eligible emission sources to the MDNR. Based on a review of this information, the MDNR concluded that the contributions from particulate matter from the non-kiln sources to visibility impairment is negligible and further analysis of these smaller particulate matter sources was not required. Meeting with the MDNR dated January 23, 2008.

[2] 40 CFR 51, Regional Haze Regulations and Guidelines for Best Available Retrofit Technology (BART) Determinations

TABLE 1-1. VISIBILITY IMPAIRMENT IMPROVEMENT

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
BART 98% Impact (Δdv)	0.79	0.64	0.48
Improvement 98% Impact (Δdv)	22%	21%	22%

2. INTRODUCTION AND BACKGROUND

On July 1, 1999, the U.S. EPA published the final Regional Haze Rule (RHR). The objective of the RHR is to improve visibility in 156 specific areas across with United States, known as Class I areas. The Clean Air Act defines Class I areas as certain national parks (over 6000 acres), wilderness areas (over 5000 acres), national memorial parks (over 5000 acres), and international parks that were in existence on August 7, 1977.

On July 6, 2005, the EPA published amendments to its 1999 RHR, often called the Best Available Retrofit Technology (BART) rule, which included guidance for making source-specific BART determinations. The BART rule defines BART-eligible sources as sources that meet the following criteria:

(1) Have potential emissions of at least 250 tons per year of a visibility-impairing pollutant,
(2) Began operation between August 7, 1962 and August 7, 1977, and
(3) Are included as one of the 26 listed source categories in the guidance.

A BART-eligible source is subject to BART if the source is "reasonably anticipated to cause or contribute to visibility impairment in any federal mandatory Class I area." EPA has determined that a source is reasonably anticipated to contribute to visibility impairment if the 98^{th} percentile visibility impacts from the source are greater than 0.5 delta deciviews (Δdv) when compared against a natural background. Air quality modeling is the tool that is used to determine a source's visibility impacts.

Once it is determined that a source is subject to BART, a BART determination must address air pollution control measures for the source. The visibility regulations define BART as follows:

> *"…an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant which is emitted by…[a BART-eligible source]. The emission limitation must be established on a case-by-case basis, taking into consideration the technology available, the cost of compliance, the energy and non air quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonable be anticipated to result from the use of such technology.*

Specifically, the BART rule states that a BART determination should address the following five statutory factors:

1. Existing controls
2. Cost of controls
3. Energy and non-air quality environmental impacts
4. Remaining useful life of the source
5. Degree of visibility improvement as a result of controls

Further, the BART rule indicates that the five basic steps in a BART analysis can be summarized as follows:

1. Identify all available retrofit control technologies;
2. Eliminate technically infeasible control technologies;
3. Evaluate the control effectiveness of remaining control technologies;
4. Evaluate impacts and document the results;
5. Evaluate visibility impacts

A BART determination should be made for each visibility affecting pollutant (VAP) by following the five steps listed above for each VAP.

BART applicability was determined for the Clarksville plant based on an applicability analysis performed by the MDNR and a refined applicability analysis performed by Holcim. Both analyses determined that the kiln is subject to BART. The details of the applicability determination can be found in Section 3.

Subsequently, Holcim performed an analysis to determine BART for each VAP for the kiln. The VAPs emitted by the kiln include NO_x, SO_2, and particulate matter with a mass mean diameter smaller than ten microns (PM_{10}) of various forms (filterable coarse particulate matter [PM_c], filterable fine particle matter [PM_f], elemental carbon [EC], inorganic condensable particulate matter [IOR CPM] as sulfates [SO_4], and organic condensable particulate matter [OR CPM] also referred to as secondary organic aerosols [SOA]). The BART determinations for SO_2 and NO_X can be found in Sections 4 and 5 respectively.

3. BART APPLICABILITY DETERMINATION

As stated in Section 2, a BART-eligible source is subject-to-BART if the source is "reasonably anticipated to cause or contribute to visibility impairment in any federal mandated Class I area." EPA has determined that a source is reasonably anticipated to contribute to visibility impairment if the 98th percentile of the visibility impacts from the source is greater than 0.5 Δdv when compared against a natural background. The MDNR conducted air quality modeling for the kiln to predict the existing visibility impairment attributable to the Clarksville plant in the following Class I areas:

- Mingo National Wildlife Refuge
- Hercules Glade Wilderness Area
- Upper Buffalo Wilderness Area

Based on this modeling, the MDNR concluded that the Clarksville plant was subject to BART since the 98th percentile of the visibility impacts attributable to the kiln are greater than 0.5 Δdv when compared against a natural background for a Class I area.

The modeling methods and procedures that Holcim followed were consistent with the methods and procedures that were followed in the MDNR's original modeling. Table 3-1 summarizes the emission rates that were modeled for SO_2, NO_X, and PM_{10}[3]. The SO_2 and NO_x emission rates are the highest actual 24-hour emission rates based on 2003-2007 continuous emissions monitoring system (CEMS) data. The PM_{10} emission rates are based on data included in Holcim's BART survey.

TABLE 3-1. MODELED 24-HOUR EMISSIONS (AS AN HOURLY EQUIVALENT)

SO_2 (lb/hr)	NO_X (lb/hr)	Total PM_{10} (lb/hr)
4889.38	3049.38	51.82

Table 3-2 summarizes the stack parameters that were used to model the kiln.

TABLE 3-2. SUMMARY OF STACK PARAMETERS

Parameter	Value
Actual Stack height (ft)	250
Stack Diameter (ft)	21.7
Exhaust Velocity (ft/s)	34.3
Exhaust Temperature (F)	367

The results of the modeling indicate that the 98th percentile of the visibility impacts are greater than 0.5 Δdv when compared against a natural background. Since the visibility impacts are greater than 0.5 Δdv, the kiln is subject to BART. The results of the modeling are summarized in Table 3-3.

[3] The non-kiln PM_{10} emissions were included in the model as part of the kiln PM_{10} emissions.

TABLE 3-3. SUMMARY OF 98TH PERCENTILE VISIBILITY IMPACTS AND NUMBER OF DAYS WITH VISIBILITY IMPACT GREATER THAN 0.5 ΔDV

Class I Area	Visibility Impairment	
	98th % Δdv	Days > 0.5 Δdv
Mingo Wilderness	1.01	75
Hercules Glades Wilderness	0.81	40
Upper Buffalo Wilderness	0.61	33

Table 3-4 provides a breakdown of the visibility impacts listed in Table 3-3 by each VAP for the high (98th percentile) day (note that the specific percentiles vary from day to day, and location to location, the breakdown listed is an example of one event only).

TABLE 3-4. BREAKDOWN OF POLLUTANT SPECIFIC CONTRIBUTIONS TO VISIBILITY FOR THE 98TH PERCENTILE DAY.

Class I Area	Visibility Impairment Attributable to SO_4 (%)	Visibility Impairment Attributable to NO_3 (%)	Visibility Impairment Attributable to SOA (%)	Visibility Impairment Attributable to EC (%)	Visibility Impairment Attributable to PM_c (%)	Visibility Impairment Attributable to PM_f (%)	Total Visibility Impairment (Δdv)
Mingo Wilderness	98.6	1.2	0	0	0	0.2	1.01
Hercules Glades Wilderness	42.3	57.5	0	0	0	0.2	0.81
Upper Buffalo Wilderness	95.7	4.2	0	0	0	0.1	0.61

As shown in Table 3-4, the most significant contributors to the visibility impairment are sulfates (SO_4) and nitrates (NO_3). The SO_4 contribution is from the chemical conversion of SO_2 emitted by the kiln to SO_4. The NO_3 contribution is entirely from the chemical conversion of NO_X emitted from the kiln. The contribution of PM_{10} to the total visibility impairment can be estimated as the sum of the contributions from SOA, EC, PMc, and PMf. The PM_{10} contribution is much smaller (<1%) than the contribution from SO_2 and NO_X.

4. SO_2 BART EVALUATION

Sulfur, in the form of metallic sulfides (pyrite), sulfate, or organosulfur compounds, is often found in the raw materials used to manufacture cement and in the solid and liquid fuels burned in cement kilns.[4] The raw materials and fuels for the Clarksville plant are no exception. Sulfur dioxide can be generated by the oxidation of sulfur compounds in the raw materials and fuels during operation of the pyroprocess. Constituents found in fuels, raw materials, and in-process materials, such as the alkali metals (sodium and potassium), calcium carbonate, and calcium oxide react with SO_2 formed in the pyroprocess and much of the sulfur leaves the process in the principle product of the kiln system called clinker.

The kiln is the only BART source which emits SO_2, thus an SO_2 BART evaluation was performed only for the kiln. The maximum actual 24-hour kiln SO_2 emission rate that was modeled for the BART applicability determination is summarized in Table 4-1.

TABLE 4-1. EXISTING ACTUAL MAXIMUM 24-HOUR SO_2 EMISSION RATES

	SO_2 24-Hour Emission Rate ton/24-hr	SO_2 Hourly Equivalent Emission Rate lb/hr
Kiln	58.67	4889.38

4.1 IDENTIFICATION OF AVAILABLE RETROFIT SO_2 CONTROL TECHNOLOGIES

Step 1 of the BART determination is the identification of all available retrofit SO_2 control technologies. A list of control technologies was obtained by reviewing the U.S. EPA's Clean Air Technology Center, publicly-available air permits, applications, and technical literature published by the U.S. EPA, state agencies, and Regional Planning Organizations (RPOs).

The available retrofit SO_2 control technologies are summarized in Table 4-2.

TABLE 4-2. AVAILABLE SO_2 CONTROL TECHNOLOGIES

SO_2 Control Technologies
Fuel Substitution
Raw Material Substitution
Dry Lime Injection/Scrubbing
Wet Lime Scrubbing

[4] Miller, F. MacGregor and Hawkins, Garth J., "Formation and Emission of Sulfur Dioxide from the Portland Cement Industry", *Proceedings of the Air and Waste Management Association*, June 18-22, 2000.

4.2 ELIMINATE TECHNICALLY INFEASIBLE SO_2 CONTROL TECHNOLOGIES

Step 2 of the BART determination is to eliminate technically infeasible SO_2 control technologies that were identified in Step 1.

4.2.1 FUEL SUBSTITUTION

Holcim uses a mixture of coal, petroleum coke, alternative fuels (synfuel), and oil as the primary fuels for the kiln. For example, the 2007 actual fuel usage breakdown on an energy input basis, was 3.4 percent coal, 84 percent petroleum coke, 11.8 percent synfuel, and 0.8 percent oil (the fuel usages are also on an as received basis). The sulfur content of the petroleum coke is approximately 5.72 percent and the sulfur content of the coal is approximately 3.45 percent. Oil is typically used during preheat of the kiln after a maintenance outage. Coal is also typically used during the kiln startup after an extended shutdown. Coal offers better flame control and appropriate heat distribution during heatup and ramp up of production. The main source of solid fuel for the kiln is petroleum coke.

The design of the long wet kiln system is such that some of the SO_2 resulting from fuel combustion may be emitted and the rest is absorbed in clinker or CKD. Therefore, if Holcim reduces sulfur in the fuel input to the kiln, a corresponding reduction in SO_2 emissions from the kiln would be expected. Holcim contacted fuel suppliers and found a low sulfur PRB coal, 0.7 % sulfur, and a regionally available 3.0% sulfur coal that could be used in lieu of the current coal/coke, which would result in a lower overall fuel sulfur content. A number of coal sources were rejected for high chlorine content. For example, a 1.0 percent sulfur source was found but the chlorine content was 1.3 percent (the mine has recently shut down as well), another mine had coal with sulfur in the 1.0 percent and 2.5 percent range, but with chlorine contents in the 0.3 percent range. Further, a 2.8 percent sulfur coal was identified, but it also had too high of a chlorine content, 0.12 percent, to be usable. The 3.0 percent sulfur coal is reported as having a chlorine content of 0.05 percent which is preferable (Note that the 2007 average chlorine content in the coke was 0.08 percent. A summary of the coal composition data obtained is provided in Appendix A. In addition, the plant is subject to chlorine input limitations from HWCMACT). Chlorine contents higher than current levels would very likely cause visible plumes/opacity issues as further described in Appendix B.

Determining the specific reduction in SO_2 emissions from a reduction in fuel sulfur is complicated as the reactions in the kiln system are complex. The sulfur is introduced into the system in the fuel as well as the raw materials (pyrites) and the sulfur exits the kiln system in the product (clinker), the cement kiln dust (CKD), and out the stack as SO_2. Further, although the sulfur in the clinker is small on a percentage basis, the magnitude of the clinker production is extremely large (greater than 1 million tons per year). Consequently, small changes in the amount of sulfur absorbed in the product can dramatically change the amount of SO_2 emitted. The variation in sulfur in the raw materials from the quarry, the clinker quality requirement determined by the market, and the kiln conditions can all cause significant changes in kiln operating parameters, such as kiln burning temperature, kiln excess Oxygen, etc. These changes can have a strong impact on the sulfur absorbed in the clinker and CKD and hence on SO_2 emissions. These operating conditions can also strongly change how the fuel sulfur affects SO_2 emissions. Reviewing the data yields that there is no linear correlation between fuel sulfur and SO_2

emissions. Although these parameters were continuously monitored and controlled, to calculate an SO_2 control effectiveness, based on switching to a lower sulfur fuel, a high number of assumptions must be made with a very low confidence in the accuracy. Regardless, an attempt has been made.

The assumptions, based on long term averages in 2007, which can vary significantly on an annual and short term (24-hr) basis, include that 65 percent of sulfur input in the kiln system is from fuel, 35 percent of sulfur input is from raw materials, and approximately 30-35 percent of total sulfur input is estimated to ultimately be emitted as SO_2 in the stack.

Low Sulfur PRB Coal – 0.7 percent sulfur

Based on the 2007 data, if all of the current coal and coke is replaced with a 0.7 percent low sulfur coal, the sulfur input from fuel is calculated to be reduced by approximately 85 percent. Following is a summary of the sulfur input reduction from the use of low sulfur coal. The low sulfur PRB coal has a lower heat content (26 Gj/Metric ton) and higher moisture content than the coke currently being used (33 Gj/Metric ton), so a higher volume of low sulfur PRB coal is needed than coke reduced.

Current – 2007 Average

Coke Usage:	160,915 metric tons
Low Heat Content	32.510 Gj/Mt
Sulfur Content:	5.72 %
Sulfur Input from Coke:	9,204 metric tons
Current Coal Usage:	9,432 metric tons
Low Heat Content	22.177 Gj/Mt
Sulfur Content:	3.45 %
Sulfur Input from Coal:	325 metric tons

Total Sulfur Input from Coke/Coal: 9,529 metric tons

Low Sulfur PRB Coal Replacement

Coal Usage:	208,546 metric tons
Heat Content	26.266 Gj/Mt
Sulfur Content:	0.7 %

Total Sulfur Input from Coal: 1,459 metric tons

Net reduction in sulfur input from coal:

9,529 metric tons – 1,459 metric tons = 8,070 metric tons = 8,893 tons

The SO_2 reduction calculation, based on the calculated sulfur reduction, is very complicated. The pyrite sulfur from the raw materials can volatilize at relatively low temperatures in the kiln, in an area where the sulfur comes in contact with the kiln feed that has only minimally been calcined into CaO. Consequently, less of this sulfur reacts with the CaO and thus is emitted. Again, if the sulfur reacted with the CaO, it would be absorbed into the clinker and CKD. The fuel sulfur, on the other hand, enters the kiln in

the burning zone and travels the entire length of the kiln, coming in contact with much higher concentrations of CaO, thus having a much greater chance of being absorbed. Consequently, there is no simple linear relationship between fuel sulfur and SO_2 emissions that can be used to confidently calculate an SO_2 reduction.

The fuel sulfur reduction of 8,893 tons corresponds with a 54 percent reduction of the total sulfur (fuel and raw material sulfur) input to the kiln system in 2007. As mentioned above, a large fraction of fuel sulfur would have been absorbed by the CaO in the system, and thus would not have been emitted as SO_2, while SO_2 emitted from the pyrite in the raw materials has less of a chance of being absorbed, so there is not a directly proportional reduction in SO_2 with the sulfur reduction from the fuels, nor with the total sulfur reduction. Holcim estimates that based on the year 2007 data, the actual SO_2 reduction is about 40% - 50%.

<u>Regional Coal – 3.0 percent.</u>
Using calculation methods similar to the low sulfur PRB coal case, a scenario that included replacing the current coal/coke with a 3.0 percent coal was evaluated. This scenario results in a sulfur input reduction of approximately 28 percent. Holcim estimates that the actual SO_2 reduction from this fuel switch would be approximately 20 - 25 percent.

These reductions are the maximum reductions in tons of SO_2 that can be expected. As mentioned previously, the actual reduction will vary significantly, especially on a short term basis. Holcim estimates that the net reduction in SO_2 for 3.0 percent sulfur coal would be 20-25 percent and for low sulfur PRB coal would be in the range of 40 percent to 50 percent.

Holcim considers this technology to be technically feasible and will consider it further.

4.2.2 RAW MATERIAL SUBSTITUTION / SELECTIVE MINING

In a long wet kiln, not only the pyritic sulfur, but total sulfur in the raw materials will have an impact on SO_2 emissions.

Part of the pyritic sulfur reacts with oxygen and forms SO_2 at the relatively lower temperature zone of the kiln. The rest of the sulfur, such as sulfates and sulfur compounds, enters the kiln at higher temperature zones, where more SO_2 is volatized. Some of this SO_2 will pass the length of the kiln without being absorbed and will thus be emitted to the stack.

Using raw materials with lower sulfur content can reduce the potential for SO_2 emissions from a wet kiln system. The limestone, shale, and other raw materials used at the Clarksville plant contain pyrites and total sulfur in varying concentrations. If zones or layers in the on-site quarry could be identified and mined selectively such that lower sulfur content materials are used, the emission rate of SO_2 could theoretically be reduced.

The Clarksville Quarry Scheduling Optimization (QSO) Model was created specifically for predicting relevant mineralogical parameters related to clinker production. Major oxides (Ca, Mg, Si, and Fe) are the primary focus of this predictive model. The sampling protocol and data analysis required for major oxide components was never intended to be adequate

for the accurate prediction of minor components, such as sulfur and sulfur compounds (See Appendix C for additional discussions on selective mining limitations based on Holcim's QSO (Quarry Scheduling Optimization) computer model).

Based on the lack of available data to predict if selective mining would be feasible, Holcim has concluded that selective mining is not considered a technically feasible SO_2 control technology for the kiln.

4.2.3 DRY LIME INJECTION/DRY LIME SCRUBBING

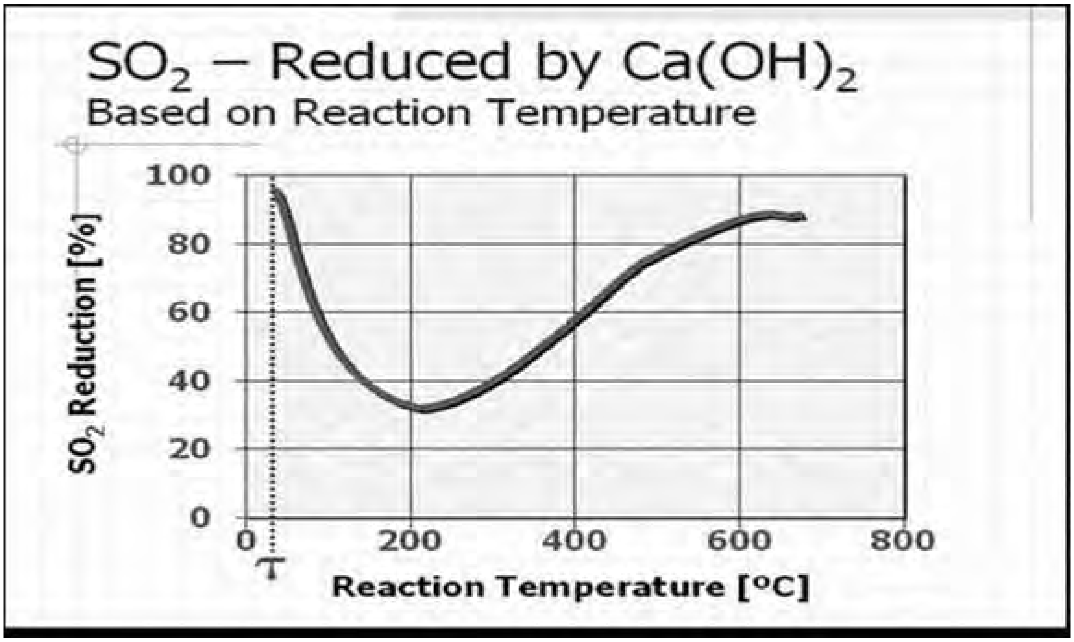
Dry Lime Injection, or Dry Lime Scrubbing (DLS), consists of injecting hydrated lime, $Ca(OH)_2$, into the flue gas. The $Ca(OH)_2$ reacts with SO_2 in the flue gas stream to create fine particles of $CaSO_3$ or $CaSO_4$. The particles are collected in the particulate matter control device (PMCD) serving the kiln.

The current PMCD was not sized/designed to handle the additional particulate matter loading that would result from this technology. Consequently, adding DLS could cause PM emissions and opacity to increase above permitted levels requiring Holcim to replace the existing PMCD (an ESP) with a new PMCD (a Baghouse).

Holcim is aware of only one other long term application of this technology on a wet kiln, which is on a smaller wet kiln in Belgium. Consequently, very little data exists to directly quantify the feasibility or benefit (emission reduction) of such a system. Regardless, Holcim is considering the technology to be technically feasible.

The effectiveness of DLS is impacted by both the temperature and the residence time/air flow rate at the location it is injected. At Clarksville, the injection point would be between the kiln outlet and the PMCD. At this location, the temperature is approximately 200 deg C (415 deg F). The temperature can not be increased at this location as the plant has limitations on the inlet temperature to the PMCD from both the Portland Cement MACT and the Hazardous Waste Combustion MACT in order to meet the Dioxin/Furan (D/F) limit. Further, lowering the temperature would lead to lower ESP efficiency and opacity problems. Figure 4-1 is a plot of SO_2 reduction versus reaction temperature from a commonly used article entitled "What is Achievable with Today's Technologies", Mark S. Terry, Krupp Polysius Corp, 2001. As indicated in the figure, at a temperature of 200 deg C (415 deg F), the reduction level is approximately 30 percent, which is the lowest reduction level over the temperature range presented.

FIGURE 4-1. SO_2 REDUCTION VERSUS REACTION TEMPERATURE FOR HYDRATED LIME



The molar ratio of lime (calcium source) to SO_2 is much higher than in a typical coal fired boiler due to a number of factors, some of which include the higher CO_2 and dust levels in the cement kiln system exhaust. The CO_2 competes with SO_2,in the reaction with the lime, and the higher dust loading reduces the even distribution of the lime in the gas. Based on a communication with the Obourg plant in Belgium, a molar ratio of between 4:1 and 6:1 has been used. The larger size of the Clarksville kiln will make it more difficult to evenly distribute the lime to the kiln gas and thus Holcim anticipates that a molar ratio of 6:1 will be required to achieve a maximum control efficiency of 20 - 30 percent.

Holcim considers this technology to be technically feasible and will consider it further.

4.2.4 WET LIME SCRUBBING

Wet lime scrubbing (WLS) is a name for a traditional tailpipe wet scrubber. This process involves passing the flue gas from the main PMCD through a sprayed aqueous suspension of $Ca(OH)_2$ or $CaCO_3$ (limestone) that is contained in an appropriate scrubbing device. In the case of the Clarksville plant, the basic underlying economics would dictate the use of ground limestone as the scrubbing reagent. Use of the cement kiln dust as a scrubbing reagent was not considered as a viable option for Clarksville due to its high chlorine content and a large amount of inerts. In WLS, the aqueous suspension of scrubbing reagent is not taken to dryness as it is in DLS. The SO_2 reacts with the scrubbing reagent to form $CaSO_3.H_20$ or gypsum that is collected and retained as aqueous sludge. The sludge is either dewatered and disposed of or used as synthetic gypsum.

The scrubbing efficiency of WLS can vary from an estimated 80 percent to 95 percent of the SO_2 in the flue gas treated by the scrubber[5]. Further, WLS is a high maintenance process with high rates of downtime expected from build up or plug up of mist-eliminators or spray nozzles and the severe wear and corrosion of components. Holcim has found that high levels of hydrocarbons (THC) in the gas stream have caused significant corrosivity and foam build-up at their Dundee plant. Further, it significantly influences the system availability and the efficiency. The THC levels at the Clarksville plant may also lead to build up and plugging, and thus an availability (uptime) of the WLS of 95 percent is assumed.

Despite these identified drawbacks, WLS is considered a technically feasible BART option.

4.3 RANK OF TECHNICALLY FEASIBLE SO_2 CONTROL OPTIONS BY EFFECTIVENESS

The third step in the BART analysis is to rank the technically feasible options according to effectiveness. Table 4-3 provides the effectiveness of each technology in the form of an annual average efficiency.

TABLE 4-3. RANKING OF TECHNICALLY FEASIBLE KILN SO_2 CONTROL TECHNOLOGIES BY EFFECTIVENESS

Control Technology	Effectiveness SO_2 Reduction (Percent Reduction – Annual Basis)
Wet Lime Scrubbing	80-95%
Fuel Substitution	20-50%
Dry Lime Scrubbing	20-30%

4.4 EVALUATION OF IMPACTS FOR FEASIBLE SO_2 CONTROLS

Step four of the BART analysis procedure is the impact analysis. The BART determination guidelines list the four factors to be considered in the impact analysis:

- Cost of compliance
- Energy impacts
- Non-air quality impacts; and
- The remaining useful life of the source

Holcim has conducted an impact analysis for the remaining SO_2 control options.

[5] Assessment of Control Technology Options for BART-Eligible Sources Steam Electric Boilers, Industrial Boilers, Cement Plants and Paper and Pulp Facilities. Prepared by Northeast States for Coordinated Air Use Management In Partnership with The Mid-Atlantic/Northeast Visibility Union, March 2005, Page 4-21, Table IV-4. Range of Removal Efficiencies of Wet SO2 Scrubbers for Long Wet Kilns.

4.4.1 WET LIME SCRUBBING

Cost of Compliance

Holcim utilized a recent WLS vendor bid, scaled to 2012 dollars[6], as the basis for the economic analysis to determine the annualized cost for WLS. Holcim divided the annualized cost of WLS by the annual tons of SO_2 reduced to determine the cost effectiveness for WLS. The "annual tons reduced" were determined by subtracting the estimated controlled annual emissions from the existing annual emissions. The existing annual emissions should be considered both on a projected actual and a potential to emit (PTE) basis. The projected actual (PA) annual SO_2 emissions provided to the MDNR in the recent Mid Kiln Firing (MKF) permit application was 11,481 tons/year[7]. The PTE listed in the MKF permit is 13,298 tons/year. The estimated controlled annual emissions were calculated by applying an 80 percent to 95 percent control efficiency and a 95 percent control device uptime, to the projected actual annual and PTE emissions. Table 4-4 provides a summary of the cost effectiveness analysis related to WLS. The detailed cost analysis table is provided in Appendix D.

The equipment cost includes both the WLS system and a limestone preparation system. The limestone preparation system includes 2 Ball Mills used to grind the limestone received to a specific fineness.

The cost effectiveness analysis does not include the cost to construct a new exhaust stack, which may be needed to employ the WLS technology, and it does not include the possible additional cost for the equipment relocation on site due to the limited space available for the WLS system.

The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

Two factors that significantly increase the cost of this technology are the need to reheat the exhaust gas and the cost of sludge disposal.

<u>Exhaust Gas Reheat</u>

A common concern of utilizing a wet scrubber on a cement kiln exhaust gas is the probable formation of a detached plume resulting in opacity violations. For a typical cement kiln stack, if the exhaust gas contains NH_3, HCl, and SO_2, sub-micron aerosols of NH_4Cl and $(NH_4)2SO_4$ may form when the gas temperature is reduced after exiting the stack. A detached plume is predicted to occur when the exhaust gas is cooled to the dew point at or near the exit of the stack and prior to the dilution of the aerosol forming constituents. The wet scrubber requires the exhaust gas to be cooled to the dew point at the inlet of the scrubber. As the temperature of the exhaust gas is cooled in the scrubber, a visible plume

[6] The most recent U.S. Department of Labor, Producer Price Index Industry Data, from April 2004 – April 2008 indicates that costs have increased by the ratio of 143.2/102.9 over the last 5 year period (or 8.06 points per year). The original bid was from 2005. Consequently, the equipment cost was scaled up to 2012 (8 years) by multiplying by the following percentage (100 + (8 x 8.06)) percent = 1.645.

[7] The projected actual annual emission rate was determined as part of the construction permit application process to support the August 27, 2007 Mid Kiln Firing construction permit. Permit Number 082007-019.

condition is nearly assured. The sub-micron NH_4Cl aerosol will be formed and is difficult to remove in the scrubber. This problem has been reported for wet scrubbers used at cement plants. As the plant is subject to a 20 percent opacity limitation from both the PCMACT and HWCMACT, even a small increase in opacity could lead to an exceedance of the standard, which is not acceptable. Based on information from Holcim's Dundee, Michigan plant, Holcim anticipates that the temperature of the exhaust gas at the exit of the scrubber would be approximately 170 deg F. To keep the sub-micron particles from forming at the exit of the stack, reheating the exhaust gas, after the scrubber, is required. A thorough evaluation of the stack gas constituents was conducted by Holcim and it was determined that to prevent an unacceptable increase in opacity from occurring, the stack gas would need to be reheated (if a scrubber is installed) to at least the current gas temperature after the ESP of approximately 380 deg F (see Appendix B for the detailed analysis). This re-heating would most likely be achieved using natural gas combustion. The natural gas combustion would lead to a 97 ton/year increase in NO_x emissions that would negatively impact visibility gains from the SO_2 reduction.

Sludge Disposal

The sludge generated from the WLS system may require disposal. Therefore, Holcim has determined the cost of disposal based on a bid from Area Disposal Services, Inc. for the disposal fee ($36/ton), as well as the cost for trailer rental ($120/month) and transportation ($220/load). In addition, Holcim also looked at the corresponding cost of building an onsite landfill for disposal, but based on information provided by MDNR, the time and resources required to obtain a permit, and the additional liability associated with an onsite landfill, Holcim decided not to pursue that option.

WLS may also lead to an increase in PM emissions because some particles of limestone or $CaSO_3$ will be entrained in the flue gas and subsequently be emitted from the scrubber. WLS is also known to increase emissions of sulfuric acid mist.[8]

TABLE 4-4. COST ANALYSIS SUMMARY FOR WET LIME SCRUBBING

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant* Removed (tons/yr)	Cost** Effectiveness ($/ton)	Cost*** Impact ($/ton clinker)
WLS – PA	80%	$24,385,436	11,481	8,726	$2,826	$20
WLS – PA	95%	$24,925,003	11,481	10,362	$2,428	$21
WLS – PTE	80%	$24,840,863	13,298	10,106	$2,482	$20
WLS – PTE	95%	$25,465,823	13,298	12,001	$2,139	$21

*Assumes 95% uptime.

**Includes 97 tons of NOx generated.

***Based on a maximum historical actual clinker production rate of 1,215,708 tons/year.

8 *Innovations in Portland Cement* Manufacturing, Portland Cement Association, 2004, pg. 660 & 669

The significant increases in cost per ton of clinker produced from using WLS, as shown in Table 4-4, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with WLS.

Energy Impacts

A wet scrubber requires an additional fan of considerable horsepower to move the flue gas through the scrubber. The exhaust gas reheat requirement will utilize approximately 1,000,000 MMcf/year of natural gas, which will itself lead to an increase in NOx emissions of 97 tons/yr.

Non Air-Quality Impacts

Without reheating, a frequent steam plume and/or detached plume can be expected at the discharge of the wet scrubber that would result in visual impairment in the area.

The WLS technology could generate over 50,000 tons per year of waste (sludge) that will require disposal in a landfill.

Remaining Useful Life

The remaining useful life of the kiln does not impact the annualized cost of WLS because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.4.2 FUEL SUBSTITUTION

Cost of Compliance

<u>Low sulfur PRB coal</u>

The increased cost of using low sulfur PRB coal (0.7 percent sulfur) includes the relative increase in fuel cost as well as the cost of a new coal mill system. Low sulfur PRB coal is harder than the current coal/coke utilized and has a lower heat content; consequently, a higher volume of coal grinding will be needed than the current mill can achieve. The increased grinding requirement would also have an additional energy requirement. A bid for a new coal mill, classifier, and mill motors, was obtained from GEBR. Pfeiffer USA Inc. and was scaled to 2012 dollars[9],

<u>Regional 3.0 percent sulfur coal</u>

The increased cost of using a regional 3.0 percent sulfur coal includes the relative increase in fuel cost as well as the cost of a new primary air fan and associated equipment. The 3.0 percent sulfur coal has a lower heat content than coke; consequently, a higher volume of coal will be needed that will require a larger primary air fan. Holcim is proposing to

[9] The most recent U.S. Department of Labor, Producer Price Index Industry Data, from April 2004 – April 2008 indicates that costs have increased by the ratio of 143.2/102.9 over the last 5 year period (or 8.06 points per year). The original bid was from 2007. Consequently, the equipment cost was scaled up to 2012 (5 years) by multiplying by the ratio of 143.2/102.9.

change the coal mill primary air fan and associated equipment. Reducing the capital cost does not have a significant impact on the outcome of the cost analysis. That is, eliminating the capitol cost completely only reduces the cost from $1,286/ton SO2 to $1,039/ton SO_2. Consequently, Holcim has chosen to not spend additional time and effort documenting these costs.

Table 4-5 provides a summary of the cost effectiveness analysis related to Fuel Substitution. The detailed cost analysis table is provided in Appendix D.

The cost effectiveness analysis does not include the cost to construct any new storage or handling facilities for the low sulfur PRB coal that may be required.

The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

TABLE 4-5. COST ANALYSIS SUMMARY FOR FUEL SUBSTITUTION

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)	Cost* Impact ($/ton clinker)
Fuel Sub – PA	23%	$3,933,016	11,481	2,641	$1,489	$3
Fuel Sub – PA	40%	$27,218,156	11,481	4,592	$5,927	$22
Fuel Sub – PA	50%	$27,218,156	11,481	5,741	$4,741	$22
Fuel Sub – PTE	23%	$3,933,016	13,298	3,059	$1,286	$3
Fuel Sub – PTE	40%	$27,218,156	13,298	5,319	$5,117	$22
Fuel Sub – PTE	50%	$27,218,156	13,298	6,649	$4,094	$22

*Based on a maximum historical actual clinker production rate of 1,215,708 tons/year

The 3.0 percent sulfur coal option (used 23 percent control as the average) is cost effective and will be considered further.

The low sulfur PRB coal option (40 to 50 percent control) is not cost effective and results in significant increases in cost per ton of clinker produced that would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with the low sulfur PRB coal scenario.

In addition, for this analysis Holcim did consider the blending of solid fuel but considered it also to not be cost effective. In order to properly blend solid fuels for a precise distribution to control sulfur and chlorine inputs and not disrupt production due to fuel quality swings, an additional solid fuel equipment handling system would have to be installed. At a minimum, for each additional solid fuel used a system consisting of feed chutes, transfer conveyors, a storage silo, and a weigh belt would be required. It was conservatively estimated that the cost would be similar to the cost of a new mill and thus increase the cost well above the 3.0% sulfur coal option.

Energy Impacts
The low sulfur PRB coal will require additional energy for grinding. The actual increase is difficult to estimate. The regional coal option also relies that a reliable source of tire derived fuel (TDF) and Hazardous Waste Derived Fuel (HWDF) is available to supplement 23% of the thermal requirements for clinker production

Non Air-Quality Impacts
None.

Remaining Useful Life
The remaining useful life of the kiln does not impact the annualized cost because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.4.3 DRY LIME SCRUBBING

Cost of Compliance
The increased cost of DLS includes the cost of hydrated lime as well as the injection system and replacing the existing ESP with a new baghouse. As the DLS injection system would likely be a custom application, Holcim's engineering department has estimated that the DLS injection system equipment cost would be approximately $1,000,000. Holcim obtained a bid for retrofitting the existing ESP with a Baghouse from GE Energy. A detailed analysis has not yet been completed to determine if the retrofit will be capable of handling the additional dust loading from the DLS system.

The quantity of hydrated lime required is calculated below on a PA and PTE basis as follows:

<u>Hydrated Lime Requirement.</u>

PA Basis:

The projected actual annual emission level of SO_2 is 11,481 tons

A molar ratio of 6:1, $Ca(OH)_2$ to SO_2, is required. The $Ca(OH)_2$ required is calculated by multiplying by the ratio of molecular weights:

6 x 11,481 tons SO_2 x (74 ton $Ca(OH)_2$/ 64 SO_2) = 79,649 tons $Ca(OH)_2$

The estimated purity of the hydrated lime is 96.8 percent $Ca(OH)_2$. Consequently, the amount required is scaled as follows:

79,649 tons $Ca(OH)_2$ / 0.968 = 82,282 tons hydrated lime

PTE Basis:

The PTE annual emission level of SO_2 is 13,298 tons

A molar ratio of 6:1, $Ca(OH)_2$ to SO_2, is required. The $Ca(OH)_2$ required is calculated by multiplying by the ratio of molecular weights:

6 x 13,298 tons SO_2 x (74 ton $Ca(OH)_2$/ 64 SO_2) = 92,255 tons $Ca(OH)_2$

The estimated purity of the hydrated lime is 96.8 percent $Ca(OH)_2$. Consequently, the amount required is scaled as follows:

92,255 tons $Ca(OH)_2$ / 0.968 = 95,304 tons hydrated lime

Table 4-6 provides a summary of the cost effectiveness analysis related to DLS. The detailed cost analysis table is provided in Appendix D. The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

TABLE 4-6. COST ANALYSIS SUMMARY FOR DRY LIME SCRUBBING

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)	Cost* Impact ($/ton clinker)
DLS – PA	20%	$14,725,124	11,481	2,181	$6,750	$12
DLS – PA	30%	$14,725,124	11,481	3,272	$4,500	$12
DLS – PTE	20%	$16,756,579	13,298	2,527	$6,632	$14
DLS – PTE	30%	$16,756,579	13,298	3,790	$4,421	$14

*Based on a maximum historical actual clinker production rate of 1,215,708 tons/year

The significant increases in cost per ton of clinker produced from using DLS, as shown in Table 4-6, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with DLS.

Energy Impacts
Additional electricity is needed for the pump used to inject the lime into the kiln gas.

Non Air-Quality Impacts
Utilizing DLS could also increase the amount of CKD sent to the landfill.

Remaining Useful Life
The remaining useful life of the kiln does not impact the annualized cost because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.5 EVALUATION OF VISIBILITY IMPACT OF FEASIBLE SO_2 CONTROLS

A final impact analysis was conducted to assess the visibility improvement for the existing emission rate when compared to the emission rate of WLS, Fuel Substitution, and DLS. The existing emission rates, and emission rates associated with controls, were modeled using CALPUFF. The existing emission rate is the same rate that was modeled for the BART applicability analysis. The SO_2

emission rate associated with WLS, Fuel Substitution, and DLS is the existing emission rates less the average anticipated control of 87.5 percent, 45 percent and 23 percent, and 25 percent respectively. The emission rates are summarized in Table 4-7.

TABLE 4-7. SUMMARY OF EMISSION RATES MODELED IN SO_2 CONTROL VISIBILITY IMPACT ANALYSIS

Emission Rate Scenario	Emission Rate		
	SO_2 (lb/hr)	NO_X (lb/hr)	PM_{10} (lb/hr)
WLS – 87.5%	611	3,049	51.82
Fuel Substitution – 45%	2,689	3,049	51.82
Fuel Substitution – 23%	3,765	3,049	51.82
DLS – 25%	3,667	3,049	51.82
Base case – Max 24-hr avg.	4,889	3,049	51.82

Comparisons of the existing visibility impacts and the visibility impacts based on WLS, Fuel Substitution, and DLS are provided in Table 4-8. The visibility improvement associated with the controls are also shown in Table 4-8; this value was calculated as the difference between the existing visibility impairment and the visibility impairment for the controlled emission rates as measured by the 98th percentile modeled visibility impact.

TABLE 4-8. SUMMARY OF MODELED IMPACTS FROM SO_2 CONTROL VISIBILITY IMPACT ANALYSIS

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
WLS 98% Impact (Δdv)	0.48	0.31	0.21

(45% Control) Fuel Subs. 98% Impact (Δdv)	0.70	0.58	0.37
Fuel Subs Improvement 98% Impact (Δdv)	0.31	0.23	0.24
(23% Control) Fuel Subs. 98% Impact (Δdv)	0.87	0.72	0.48
Fuel Subs Improvement 98% Impact (Δdv)	0.14	0.09	0.13
DLS 98% Impact (Δdv)	0.87	0.70	0.48
DLS Improvement 98% Impact (Δdv)	0.14	0.11	0.13

4.6 PROPOSED BART FOR SO_2

Holcim reviewed each control option's availability, as well as its cost of compliance, energy impacts, and non-air quality impacts, as well as the remaining useful life of the kiln. Table 4-9 summarizes the cost effectiveness for the controls based on the tons of SO_2 reduced and the visibility improvement in deciviews.

TABLE 4-9. SUMMARY OF COST EFFECTIVENESS OF SO_2 CONTROL OPTIONS

Control Option*	Existing Emissions (tons/yr)	Reduced Annual Emissions (tons/yr)	Annual Cost ($/yr)	Cost** Effectiveness ($/ton)	Cost Impact ($/ton clinker)
WLS–PA–80%	11,481	8,726	$24,385,436	$2,826	$20
Fuel Sub–PA-40%	11,481	4,592	$27,218,156	$5,927	$22
Fuel Sub–PA–23%	11,481	2,641	$3,933,016	$1,489	$3
DLS – PA - 20%	11,481	2,181	$14,725,124	$6,750	$12

*The worst case scenario from a cost effectiveness perspective is provided.
**Includes 97 tons of NOx generated for WLS

Control Type **WLS–PA–80%** Class I Area	Base 98th Percentile Impact (DV)	Controlled 98th Percentile Impact (DV)	98th Percentile Improvement (DV)	98th Percentile Improvement (%)	Cost Effectiveness ($/DV)

Mingo	1.01	0.87	0.14	13.9	$105,179,459
Hercules	0.81	0.70	0.11	13.6	$133,864,766
Buffalo	0.61	0.48	0.13	21.3	$113,270,187

Based on the five step analysis outlined by EPA, this analysis demonstrates that the cost of compliance associated with WLS, Fuel Substitution with low sulfur PRB coal, and DLS is extremely high on a $/ton of SO_2 removed basis, and especially on a $/DV of improvement basis, and is not economically feasible, especially if the cost per ton of clinker produced is taken into account. Fuel Substitution with a regional 3.0 percent sulfur coal, resulting in a 23 percent reduction in SO_2 emissions, is economically feasible and is being proposed as BART.

Holcim proposes that BART for SO_2 for the Holcim Clarksville Kiln is fuel substitution or equivalent technologies that will achieve a 23 percent reduction in the maximum daily SO_2 emission rate of 117,345 lbs.

To comply with this determination, Holcim is proposing an enforceable limit of 23% reduction in the maximum daily SO_2 emission rate of 117,345 lbs used for modeling visibility impairment. As documented throughout this report, fluctuations in daily kiln operations and inputs, and the uncertainty in predicting the daily absorption of sulfur in the clinker, Holcim proposes that the enforcement of the reduction be based on a 30 day rolling average.

In Portland cement kilns, the NO_X that is generated is primarily classified into one of two categories, i.e., thermal NO_X or fuel NO_X[10]. Thermal NO_X occurs as a result of the high-temperature oxidation of molecular nitrogen present in the combustion air. Fuel NO_X is created by the oxidation of nitrogenous compounds present in the fuel. It is also possible for nitrogenous compounds to be present in the raw material feed and become oxidized to form additional NO_X referred to as feed NO_X.

Due to the high flame temperature in the burning zone of the rotary kiln (3400^{o} F), NO_X emissions from the kiln tend to be mainly comprised of thermal NO_X. Although NO_X emissions from cement kilns include both nitrogen oxide (NO) and nitrogen dioxide (NO_2), typically, less than 10% of the total NO_X in the flue gas is NO_2.[11]

The kiln is the only BART source which emits NO_x, thus a NO_x BART evaluation was performed only for the kiln. The maximum actual 24-hour kiln NO_x emission rate that was modeled for the BART applicability determination is summarized in Table 4-1. The NO_x 24-hour maximum actual emission rate was determined from analyzer data for November 24, 2007.

TABLE 5-1. EXISTING ACTUAL MAXIMUM 24-HOUR NO_x EMISSION RATES

	NO_x 24-Hour Emission Rate ton/24-hr	NO_x Hourly Equivalent Emission Rate lb/hr
Kiln	36.59 (73,185 lbs)	3,049

5.1 IDENTIFICATION OF AVAILABLE RETROFIT NO_X CONTROL TECHNOLOGIES

Step 1 of the BART determination is the identification of all available retrofit NO_X control technologies. A list of control technologies was obtained by reviewing the U.S. EPA's Clean Air Technology Center, control equipment vendor information, publicly-available air permits, applications, and technical literature published by the U.S. EPA and the RPOs.

The available retrofit NO_X control technologies are summarized in Table 5-2.

[10] NO_X Formation and Variability in Portland Cement Kiln Systems, Penta Engineering, December 1998.

[11] IBID.

TABLE 5-2. POSSIBLE NO_X CONTROL TECHNOLOGIES

Kiln Control Technologies
Low NO_X Burner Flue Gas Recirculation CKD Insufflation Mid-Kiln Firing of Tires Selective Noncatalytic Reduction Selective Catalytic Reduction

5.2 ELIMINATE TECHNICALLY INFEASIBLE NO_X CONTROL TECHNOLOGIES

Step 2 of the BART determination is to eliminate technically infeasible NO_X control technologies that were identified in Step 1.

5.2.1 LOW-NO_X BURNER IN THE ROTARY KILN

Low NO_x burners (LNBs) reduce the amount of NO_x formed at the flame. The principle of all LNBs is the same: stepwise or staged combustion and localized exhaust gas recirculation (i.e. at the flame). As applied to the rotary cement kiln, the low-NO_X burner creates primary and secondary combustion zones at the end of the main burner pipe to reduce the amount of NO_x initially formed at the flame. In the high-temperature primary zone, combustion is initiated in a fuel-rich environment in the presence of a less than stoichiometric oxygen concentration. The oxygen-deficient condition at the primary combustion site minimizes thermal and fuel NO_X formation and produces free radicals that chemically reduce some of the NO_X that is being generated in the flame.

In the secondary zone, combustion is completed in an oxygen-rich environment. The temperature in the secondary combustion zone is much lower than in the first; therefore, lower NO_X formation is achieved as combustion is completed. CO that has been generated in the primary combustion zone as an artifact of the sub-stoichiometric combustion is fully oxidized in the secondary combustion zone.

Low-NO_X burners are considered to be a technically feasible option for NO_X control. As Holcim already has a LNB, the technology will not be considered further.

5.2.2 FLUE GAS RECIRCULATION

Flue gas recirculation involves the use of oxygen-deficient flue gas from some point in the process as a substitute for primary air in the main burner pipe in the rotary kiln. Flue gas recirculation (FGR) lowers the peak flame temperature and develops localized reducing conditions in the burning zone through a significant reduction of the oxygen content of the primary combustion "air." The intended effect of the lower flame temperature and reducing conditions in the flame is to decrease both thermal and fuel NO_X formation in the rotary kiln.

While FGR is a practiced control technology in the electric utility industry, Holcim is not aware of any attempt to apply FGR to a cement kiln because of the unique process requirements of the industry, i.e., a hot flame is required to complete the chemical reactions that form clinker minerals from the raw materials. The process of producing clinker in a cement kiln requires the heating of raw materials to about 2700°F for a brief but appropriate time to allow the desired chemical reactions that form the clinker minerals to occur. A short, high-temperature flame of about 3400°F is necessary to meet this process requirement. The long/lazy flame that would be produced by FGR would result in the production of lower or unacceptable quality clinker because of the resulting undesirable mineralogy. Clinkering reactions must take place in an oxidizing atmosphere in the burning zone to generate clinker that can be used to produce acceptable cement. FGR would tend to produce localized or general reducing conditions that also could detrimentally affect clinker quality. Due to these important limitations on the application of FGR and the lack of a successful demonstration on a cement kiln in the United States, FGR is not a technically feasible control option for NO_X control at this time.

5.2.3 CEMENT KILN DUST INSUFFLATION

Cement kiln dust (CKD) is a residual byproduct that can be produced by any of the four basic types of cement kiln systems. CKD is most often treated as a waste even though there are some beneficial uses. However, as a means of recycling usable CKD to the cement pyroprocess, CKD sometimes is injected or insufflated into the burning zone of the rotary kiln in or near the main flame. The presence of these cold solids within or in close proximity to the flame has the effect of cooling the flame and/or the burning zone thereby reducing the formation of thermal NO_X. The insufflation process is somewhat counterintuitive because a basic requirement of a cement kiln is a very hot flame to heat the clinkering raw materials to about 2700^{o} F in as short a time as possible. The Clarksville plant already uses this technology and it is already included in the baseline. Therefore, this option is removed from consideration for BART.

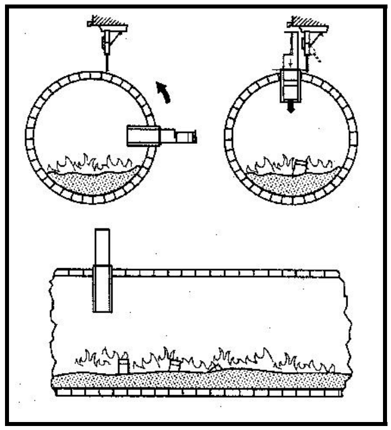
5.2.4 MID-KILN FIRING OF SOLID FUEL WITH MIXING AIR FAN

Secondary combustion is defined as follows: a portion of the fuel is fired in a location other than the burning zone. This reduces thermal NO_x generation because the temperature in the secondary combustion zone is less than 2100 °F. Mid-kiln firing (MKF) of solid fuels is an example of secondary combustion and includes fuels such as used tires, oil filter fluff, plastics, spent activated carbon and carbon black, asphalt shingles, diaper manufacturing waste, and other combustible solids. MKF improves clinker process energy efficiency, allows for greater operational flexibility with respect to fuel types, and is currently listed as a NOx control technology in 10 CSR 10-6.380 Control of NOx Emissions from Portland Cement Kilns.

An example of a MKF system is the Cadence feed form MKF technology which was first introduced in 1989. It is comprised of three primary components: (1) a staging arm or "feed fork," that picks up the fuel modules and positions them for entry into the kiln, (2) two pivoting doors that open to allow the fuel to drop into the kiln, and (3) a drop tube that

extends through the side wall of the kiln. In addition to these basic components, feed fork technology also requires a delivery system which positions the fuel models so they can be picked up by the feed fork and a mechanism for opening the doors so the fuel can enter the kiln. Due to rotation of the kiln, fuel can only be injected once per revolution from the top, as shown in Figure 5-1.

FIGURE 5-1. MID-KILN FIRING SCHEMATIC[12]



High-pressure air, in the range of a 2-10 percent replacement of the primary combustion air, could be injected through the shell of the rotary kiln and into the calcining zone to where a mixing air fan mixes the air with the gas and fuel within the rotary kiln for more complete combustion of the solid fuel.

By adding fuel mid-kiln, MKF changes both the flame temperature and flame length. These changes should reduce thermal NO_X formation by burning part of the fuel at a lower temperature and by creating reducing conditions at the mid-kiln fuel injection point which may destroy some of the NO_X formed upstream in the kiln burning zone.

Clarksville has the largest long kiln in the world. The kiln has a 7 meter diameter and a very high thermal capacity. Using whole tires to replace 10% of total fuel consumption will require four whole tires being fed to the mid-kiln door per kiln revolution, 12% fuel replacement would require 5 tires per revolution. The maximum tire feed rate per revolution that Holcim is aware of, on similar applications, is three tires per revolution. Holcim is concerned that the greater the number of tires fed per revolution, on a continuous basis, the greater the potential for process upsets from unstable feeding. Holcim has found that kilns being fed even one to three tires per revolution can have problems with stable, uniform feeding. In addition, if too many tires burn at the bottom of the kiln, a high local temperature could result which would disturb the normal operation of the kiln and potentially increase NOx. Further, due to the large kiln diameter, the reducing zone created by burning tires may only impact a small cross section of the entire cross section of the kiln, thus having less of an overall reduction in NOx than anticipated.

[12] NO_X Control Technologies for the Cement Industry, EC/R Incorporated, Chapel Hill, NC, USA, U.S. EPA Contract NO. 68-D98-025, U.S. EPA RTP, September 19, 2000.

In an effort to better understand these uncertainties, Holcim hired CINAR Company, the expert in this field, to conduct modeling of the system and to predict NOx reduction. Their study predicted that a 15% NOx reduction would occur at 10% replacement (replace 10% of the current fuel with tires) and 27% NOx reduction for 15% replacement.

To then determine the thermal substitution rate (TSR) of tires that the Clarksville plant is capable of utilizing, three additional factors must be considered:

1. Tire availability. The local market only has sustainable resources of 10-12% TSR;
2. Tire feeding limit: 12% TSR equates to five tires being fed per revolution.
3. The thermal stability of operation in a large kiln. 15% TSR is predicted to be the maximum for short term periods, whereas 10-12% TSR is predicted to be achievable on a long term basis.

Based on the lack of experience using MKF of tires on kilns the size of Clarksville, Holcim is relying on the computer modeling (regardless of the general uncertainty that exists with computer models) to estimate the NOx reduction. Holcim anticipates that MKF of tires may achieve up to 20% percent NOx reduction at a TSR of 12 percent on a long term basis.

Tires also have the benefit of a lower sulfur content (the Rubber Manufacturers Association reports a value of 1.83 percent) relative to the current coal/coke used. However, without conducting testing, it is unknown if utilizing tires at the mid-kiln location will result in the same reduction in SO_2 emissions predicted for reductions in fuel sulfur. Consequently, a reduction in SO_2 emissions from the use of tires was not considered further.

MKF is considered to be a technically feasible option for NOx control. Further, Holcim has already received a construction permit that would allow the installation of MKF, whereas other technologies would require a new construction permit application process, the result of which is unknown.

5.2.5 SELECTIVE NONCATALYTIC REDUCTION

In the relatively narrow temperature window of 1600 to 1995°F, ammonia (NH_3) reacts with NO_x without the need for a catalyst to form water and molecular nitrogen in accordance with the following simplified reactions.

$4NO + 4NH_3 + O_2 \rightarrow 4N_2 + 6H_2O$
$2NO_2 + 4NH_3 + O_2 \rightarrow 3N_2 + 6H_2O$

As applied to NO_x control from cement kilns and other combustion sources, this technology is called selective noncatalytic reduction (SNCR). Above this temperature range, the NH_3 is oxidized to NO_x thereby increasing NO_x emissions. Below this temperature range, the reaction rate is too slow for completion and unreacted NH_3 may be

emitted from the pyroprocess. This temperature window generally is available at some location within the rotary kiln. The NH_3 could be delivered to the kiln shell through the use of anhydrous NH_3, or an aqueous solution of NH_3 (ammonium hydroxide) or urea.

A concern about application of SNCR technology is the breakthrough of unreacted NH_3 as "ammonia slip" and its subsequent reaction in the atmosphere with SO_2, sulfur trioxide (SO_3), hydrogen chloride (HCl) and/or chlorine (Cl_2) to form a detached plume of sub-micron particles. As NH_3 or Urea injection rates are increased, to attempt to achieve higher levels of reduction, NH_3 emission levels are increased.

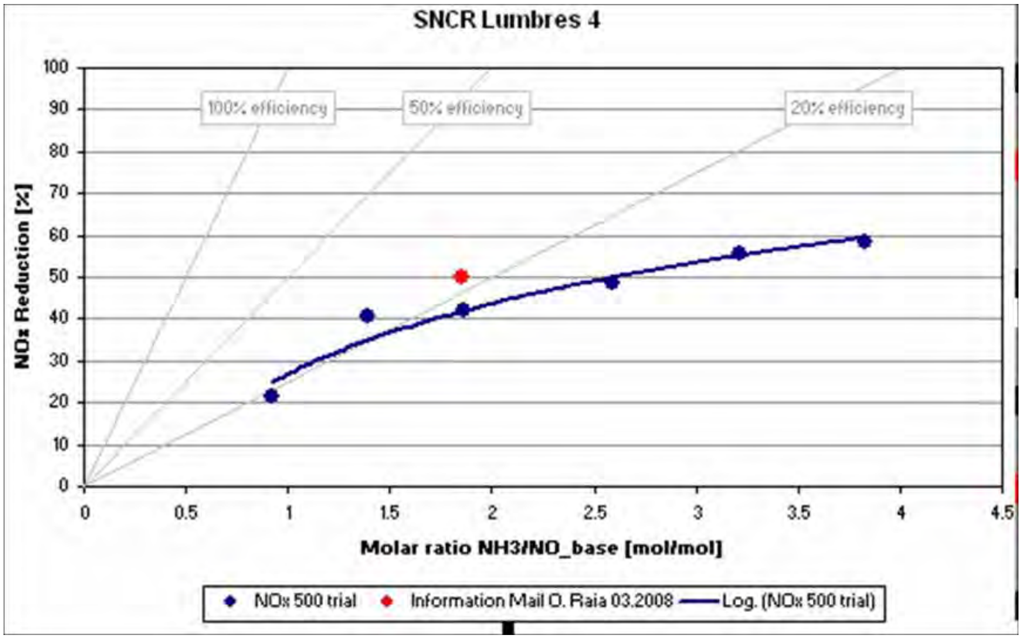
Industry Experience

Ash Grove Cement Company installed a full scale SNCR system on one of its wet kilns in Midlothian, Texas. Ash Grove has reported that it is achieving a 35 to 40% NOx reduction; however, as this application has just started, no data is available to verify this reduction is being achieved or on what averaging period or the long term sustainability.[13]

Holcim's wet plant in Lumbres, France utilizes SNCR. It is the earliest application of SNCR on a long kiln in the world and has been running for multiple years. The plant has found that NH_3 slip increases as the urea injection rate increases especially when the molar ratio is more than 1.0 (i.e. the NH_3 added is more than needed for the reaction). At this level, significant amounts of NH_3 are unreacted. The plant reports achieving 20 percent NOx reduction at a 1.0 molar ratio of NH_3/NOx and 40 percent at a molar ratio of 1.5 as shown in Figure 5-2.

[13] BART Five Factor Analysis. Ash Grove Cement Company Montana City, Montana. Dated June 2007. Page 5-9.

FIGURE 5-2. NOX REDUCTION VERSUS NH3 MOLAR RATIO OBSERVED AT HOLCIM LUMBRES PLANT.



However, at 20 percent NOx reduction, the NH_3 slip is reported to be 10 mg/m3, while at 40 percent reduction, the NH_3 slip can be 20 – 30 mg/m^3 (a 50 percent to 100 percent increase). Based on experiences at many cement plants with SO_2 and HCl in the exhaust gas, which is also the case for the Clarksville plant, a 20 mg/Nm3 NH_3 increase would cause a severe increase in plume visibility. The Lumbres plant is also smaller than Clarksville, having a diameter of only 3.3 meters versus Clarksville's 7 meter diameter kiln. The larger diameter of Clarksville's kiln would make distribution of the reagent across the kiln more difficult, and would reduce the effectiveness to an unknown degree.

NO_X reductions from SNCR systems can vary considerably based on site specific conditions, most notably being the type of kiln. For example, the NO_X reduction at the long wet kiln at Lumber is lower at a given ammonia molar ratio than observed at similar size preheater/pre-calciner (PH/PC) kilns. Some of the reasons for this lower relative NO_X reduction include:

- In a long wet kiln, the NH_3 is sprayed in the kiln itself, rather than being sprayed in the ductworks in a PH/PC kiln. A kiln's diameter is much larger than the ductwork diameter which makes it more difficult for the liquid NH_3 to be evenly distributed across the entire cross section of the gas stream.
- Studies have shown that in long kilns, the gas stream can be highly stratified over the cross section. The relatively heavy CO_2 released from the raw materials tends to stay on the top and bottom of the raw material bed, while lighter O_2 tends to float to the top of the kiln cylinder. This theory has been proven by many actual measurements at the plant. In contrast, the ductwork in PH/PC kiln systems are mostly vertical and this stratification is not observed, or is much less than in the

horizontal kiln system. The combination of stratification in the kiln cylinder, and less even distribution of NH_3, compound the problem of poor contact between the NH_3 and NO_X.

- The reaction of NH_3 and NO_X includes multiple steps that require O_2. In the areas of the long kiln that are lacking in O_2, the reaction rate is significantly lower, and thus NOx reduction is significantly lower relative to a well mixed gas stream.

Based on the concerns with NH_3 slip at high molar ratios, and the uncertainty regarding the level of effectiveness of the reagent in Clarksville's large diameter kiln, Holcim anticipates that at a molar ratio of about 1.0, an average annual control efficiency of 20 percent could likely be achieved without excessive NH_3 slip. However, a pilot study would need to be conducted to verify this. Regardless, SNCR is considered to be a technically feasible option for NO_X control.

5.2.6 SELECTIVE CATALYTIC REDUCTION

Selective Catalytic Reduction (SCR) is an add-on control technology for the control of emissions of the oxides of nitrogen (NO_x) from a combustion process. SCR has been successfully employed in the electric power industry. The basic SCR system consists of a system of catalyst grids placed in series with each other within a vessel that is located in a part of the process where the normal flue gas temperature is in the required range. An ammonia-containing reagent is injected at a controlled rate upstream of the catalyst grids that are designed to ensure relatively even flue gas distribution within the grids, to provide good mixing of the reagent and flue gas, and to result in minimum ammonia (NH_3) slip.[14] The NH_3 reacts with NO_X compounds (i.e., NO and NO_2) on the surface of the catalyst in equal molar amounts (i.e., one molecule of NH_3 reacts with one molecule of NO_X). Common reagents include aqueous NH_3, anhydrous NH_3 and urea $[(NH_2)_2CO]$. In the presence of the catalyst, the injected ammonia is converted by OH^- radicals to ammonia radicals (i.e., NH_2^-), which, in turn, react with NO_X to form N_2 and H_2O. The SCR catalyst enables the necessary reactions to occur at lower temperatures than those required for Selective Non-Catalytic Reduction (SNCR). While catalysts can be effective over a larger range of temperatures, the optimal temperature range for SCR is 570 - 750º F.

The catalyst system used in SCR applications usually consists of (1) a porous honeycomb of a ceramic substrate onto which catalyst has been attached to the surface of the ceramic material, or (2) a flat or corrugated plate onto which catalytic material has been deposited on the surface. A porous metal oxide with a high surface area-to-volume ratio acts as a catalyst base. On this base, typically titanium dioxide (TiO_2), one or more metal oxide catalysts are deposited in various concentrations. In SCR applications, the active catalyst material typically consists of vanadium pentoxide (V_2O_5), tungsten trioxide (WO_3), and molybdenum trioxide (MoO_3) in various combinations. The composition, also known as the catalyst formulation, is tailored by the catalyst vendor to best suit a particular SCR application. Catalyst deactivation through poisoning, fouling, masking, sintering and erosion are common problems for SCR catalysts that, without careful process design and

[14] Slip refers to the quantity of unreacted reagent that exits the SCR reactor.

operation, could be exacerbated. If not fouled by sulfur dioxide (SO_2), the catalysts used in SCR have a propensity to oxidize sulfur dioxide (SO_2) in the flue gas to sulfur trioxide (SO_3), a more undesirable pollutant.

Because the reaction rate of NH_3 and NO_X is temperature dependent, the temperature of the flue gas stream to be controlled is the most important consideration in applying SCR technology to any combustion source. The optimum temperature range for SCR application is about 300º C (570º F) to 450º C (840º F). This range of normal process temperature would occur within the kiln of a long wet kiln, rather than in the exhaust gas between the wet kiln and the PMCD inlet.

SCR has not been applied to any wet cement plant in the world and is not considered an available technology.

As explained in more detail below, a technology is considered "available" if it can be obtained by the applicant through commercial channels or is otherwise available within the common sense meaning of the term. An available technology is “applicable” if it can reasonably be installed and operated on the source type under consideration. A technology that is available and applicable is technically feasible. Availability in this context is further explained using the following process commonly used for bringing a control technology concept to reality as a commercial product: concept stage; research and patenting; bench scale or laboratory testing; pilot scale testing; licensing and commercial demonstration; and Commercial sales.

A control technique is considered available, within the context presented above, if it has reached the licensing and commercial sales stage of development. A source would not be required to experience extended time delays or resource penalties to allow research to be conducted on a new technique. Neither is it expected that an applicant would be required to experience extended trials to learn how to apply a technology on a totally new and dissimilar source type. Consequently, technologies in the pilot scale testing stages of development would not be considered available. An exception would be if the technology were proposed and permitted under the qualifications of an innovative control device consistent with the provisions of 40 CFR 52.21(v) or, where appropriate, the applicable SIP [in which case it would be considered available].

Therefore, SCR is eliminated from further consideration as BART for NO_x control at the Clarksville plant.

.

5.3 RANK OF TECHNICALLY FEASIBLE NO_X CONTROL OPTIONS BY EFFECTIVENESS

The third step in the BART analysis is to rank the technically feasible options according to effectiveness. Table 5-3 presents potential NO_X technically feasible control technologies by effectiveness.

TABLE 5-3. RANKING OF TECHNICALLY FEASIBLE KILN NO_X CONTROL TECHNOLOGIES BY EFFECTIVENESS

Control Technology	Effectiveness NO_X Emissions Level (%)
MKF	20%
SNCR	20%
LNB, CKD Insufflation, and Synfuel	Already utilized at Clarksville

5.4 EVALUATION OF IMPACTS FOR FEASIBLE NO_X CONTROLS

Step four for the BART analysis procedure is the impact analysis. The BART determination guidelines list four factors to be considered in the impact analysis:

- Cost of compliance
- Energy impacts
- Non-air quality impacts; and
- The remaining useful life of the source

5.4.1 MKF

Cost of Compliance

Holcim anticipates that MKF and SNCR have relatively the same level of effectiveness. Because SNCR would require a pilot study to prove or verify the effectiveness of NOx reduction and the potential associated opacity issues due to ammonia slip (see Appendix B), Holcim is accepting the use of MKF as BART. As Holcim is accepting the most stringent control option available as BART, the cost of compliance is not required to be evaluated.

Energy Impacts and Non Air-Quality Impacts

There are no known adverse energy or non-air impacts from MKF. MKF of tires has the benefit of eliminating tires from landfills and illegal dumping. It also reduces CO_2 emissions (a Green House Gas) and reduces fossil fuel use.

Remaining Useful Life

The remaining useful life of the kiln does not impact the annualized costs of MKF because the useful life is anticipated to be at least as long as the capital cost recovery period, which would be 15 years.

5.5 EVALUATION OF VISIBILITY IMPACT OF FEASIBLE NO_X CONTROLS

The final impact analysis was conducted to assess the visibility improvement for existing emission rates when compared to the emission rate with MKF. The existing emission rates and emission rates associated with MKF were modeled using CALPUFF. The existing emission rates are the same rates that were modeled for the BART applicability analysis. The NO_x emission rate associated with MKF

was the existing emission rate less an average reduction of 20 percent. The emission rate is summarized in Table 5-4.

TABLE 5-4. SUMMARY OF EMISSION RATES MODELED IN NO_X CONTROL VISIBILITY IMPACT ANALYSIS

Emission Rate Scenario	Emission Rate SO_2 (lb/hr)	 NO_X (lb/hr)	 PM_{10} (lb/hr)
MKF,	4,889	2,440	51.82
Base case – High 24 hr average	4,889	3,049	51.82

Comparisons of the 98th percentile existing visibility impacts and the visibility impacts based on MKF are provided in Table 5-5. The visibility improvement associated with MKF are also shown in Table 5-5; this was calculated as the difference between the existing visibility impairment and the visibility impairment for the remaining control options as measured by the 98th percentile modeled visibility impact.

TABLE 5-5. NO_X CONTROL VISIBILITY IMPACT ANALYSIS

	Existing 98% Impact (Δdv)	MKF 98% Impact (Δdv)	Improvement
Mingo	1.01	0.92	8.9%
Hercules	0.81	0.72	11.1%
Upper Buffalo	0.61	0.60	1.6%

As seen in Tables 5-5, the MKF option results in a visibility improvement of up to 11.1 percent in the Hercules Glades Class I area.

5.6 PROPOSED BART FOR NO_X

Based on the five step analysis outlined by EPA, MKF was identified as the highest ranking feasible add-on control technology. Energy and environmental impacts were assessed for this technology and the visibility improvements were evaluated against existing conditions. Consistent with EPA guidance, economic impacts were not assessed as Holcim was willing to utilize the highest ranked control technology. The visibility impact analysis demonstrates that the utilization of MKF to achieve a 2,440 lb/hr NO_x emission rate results in up to an 11.1 percent visibility improvement. Neither non-air quality nor energy impacts associated with this control technology eliminate it in favor of retaining the existing rates as BART.

Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system or equivalent that will achieve a 20 percent reduction in the maximum daily NO_X emission rate of 73,185 lbs.

To comply with this determination, Holcim is proposing an enforceable limit of a 20% reduction in the maximum daily NO_X emission rate of 73,185 lbs used for modeling visibility impairment. As documented in this report, the dynamics in daily kiln operations and inputs and the lack of

information on predicting short term actual reductions from MKF, Holcim proposes that the enforcement of the reduction be based on a 30 day rolling average.

Based on the lack of site specific, or significant industry data, for the use of this technology on wet cement kilns, it is possible that Holcim will further evaluate the MKF system and determine that MKF results in limited or no additional benefit. In the future, an alternative technology or methodology may become feasible and could be implemented as needed. Holcim will continue to utilize the NOx controls that are already in place, including LNB, insufflation, and the use of alternative fuels as available.

6. BART SUMMARY

Based on the five-step analysis, Holcim proposes the following as BART:

Kiln:

- PM_{10} – Holcim has determined that the existing electrostatic precipitator constitutes BART. This control device is effective for controlling PM_{10} from a wet kiln.

- NO_X – Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system or equivalent that will achieve a 20 percent reduction in the maximum daily NO_X emission rate of 73,185 lbs.

- SO_2 – Holcim proposes that BART for the Holcim Clarksville Kiln is fuel substitution or equivalent that will achieve a 23 percent reduction in the maximum daily SO_2 emission rate of 117,345 lbs.

The proposed BART control strategies will result in reductions of the visibility impacts attributable to the Clarksville plant. A summary of the visibility improvement at Class I areas based on the existing emission rates and proposed BART emission rates is provided in Table 6-1.

TABLE 6-1. VISIBILITY IMPAIRMENT IMPROVEMENT

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
BART 98% Impact (Δdv)	0.79	0.64	0.48
Improvement 98% Impact (Δdv)	22%	21%	22%

Holcim proposes to implement BART on or before 5 years after EPA approval of Missouri's Regional Haze Rule State Implementation Plan as per 40 CFR 51 Appendix Y. Because the actual implementation date is at least 5 years from the date of this document, Holcim requests that it not be bound to the technologies reviewed during this analysis, but to the percent reductions stated in the report. Changes in technology may offer opportunities to obtain even better reductions with lower cost impact.

Due to the variability in kiln operation and inputs as referenced in the report, Holcim proposes to comply with an enforceable limit of 23% reduction in SO2 emissions and 20% reduction in NOx emissions from the daily maximum emission rates, as modeled, on a 30 day rolling average.

APPENDIX B. REVIEW OF THE POTENTIAL FOR PLUME OPACITY EXCEEDANCES RESULTING FROM THE USE OF A WET SCRUBBER

Appendix B. Review of the Potential for Plume Opacity Exceedances Resulting from the Use of a Wet Scrubber.

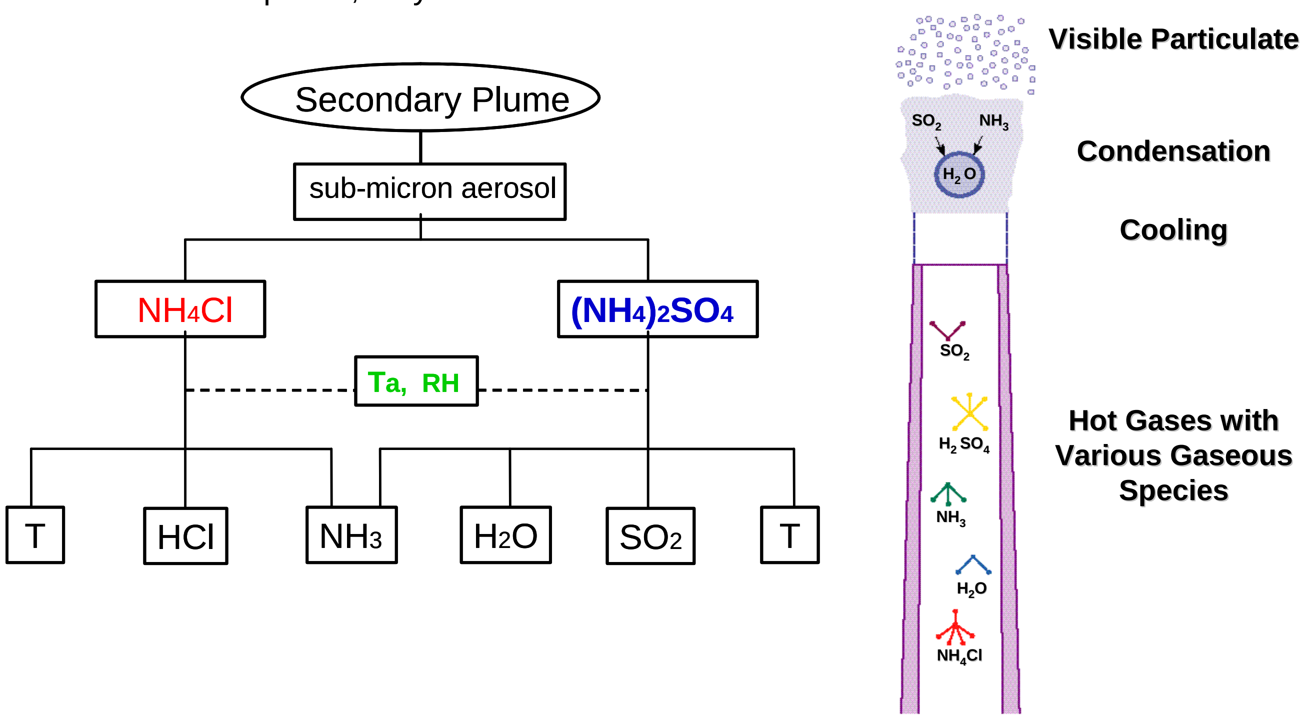
Nianzhi Wang, MPC-E

In the BART analysis for Holcim's Clarksville (CV) facility, a wet scrubber has been evaluated as a BART control option for SO_2. Although, a scrubber was shown to be technically feasible, it was also determined that reheating of the exhaust gas would be necessary to avoid a detached/attached plume. Following is an analysis of the gas stream to determine the specific temperature needed for the plume reheating requirement. The kiln system is currently controlled by an ESP and currently has an outlet gas temperature of approximately 380 deg F.

Background - The plume problem in cement manufacturing process

To evaluate the reheating requirement, we have to briefly introduce the plume problem in cement plants and potential risk of a visible plume after the scrubber.

The following figure shows the chemical reactions for most common types of plume in the cement manufacturing process, Although SO_3 and Total Hydrocarbons (THC) may also contribute to the plume, they have not been considered.



T = Stack Temperature, RH = Ambient Relative Humidity, Ta = Ambient Temperature

Some of the key points relevant to the diagram include:

- Both $(NH4)_2SO4$ and NH_4Cl are sub-micron aerosols that form at relatively low stack temperatures. $(NH4)_2SO4$ formation needs condensed moisture to occur. Whereas NH_4Cl solid can quickly form directly from the gas phase of NH_3 and HCl although with condensed moisture the reaction rate will be much faster.
- Sub-micron aerosols are similar in size to the wave length of light and thus strongly scatter the light and block light transmission through the stack gas. Figure 1 provides an example of relative light extinction versus particle size. For example, a $PM_{0.5}$ particle has an extinction efficiency approximately an order of magnitude greater than that of PM_{10}.

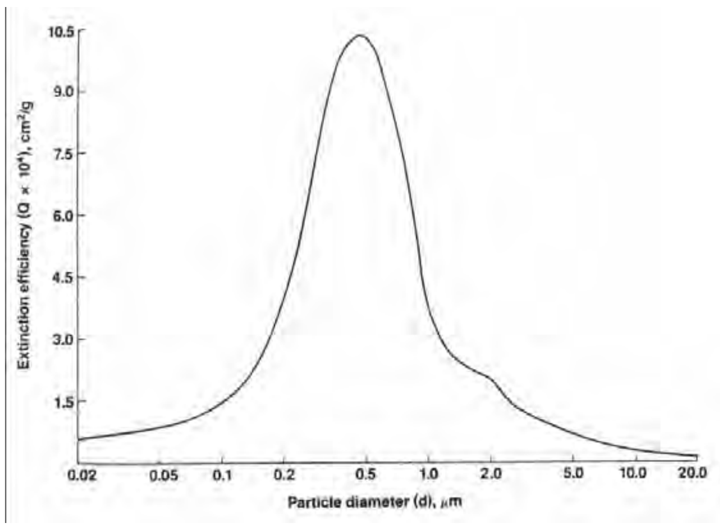


Figure 1. Extinction Efficiency Factor Verses Particle Diameter.

- The particle light extinction efficiency factor indicates the total light flux scattered and absorbed by a particle. Aerosols in the 0.2 - 1.0 μm diameter range are particularly effective in scattering visible light (wavelength: about 0.4 - 0.7 μm) on a unit mass basis, with a peak attenuation at 0.5 μm.

- The particles of either very large (>5 μm) or very small (<0.1 μm) diameter are much less effective in light attenuation.

- Plume aerosols usually form outside of the stack when the gas temperature is quickly cooled down and moisture is condensed, but the precursors have not had sufficient time to be diluted with ambient air. This situation is most dominant in occurrence on cold, calm and humid days.

Supplement A, at the end of this document, contains examples of historical visible plume problems in the cement industry and related studies.

Problems Associated with Using a Wet Scrubber on the Clarksville Kiln Exhaust Gas (in-stack)

- If a wet scrubber is installed after the Clarksville kiln, the kiln gas will need to be quenched and cooled down to the dew point temperature at the inlet of the scrubber (a similar condition of gas cooling in the presence of high humidity that can occur at the exit of a stack). If the gas has NH_3 and HCl, they can quickly react to form aerosols (fine particulate matter). These very fine particulates are controlled with a much lower efficiency than larger PM and thus can increase PM levels of the form of PM that leads to the highest plume visibility.

- In addition, the scrubber can not remove all NH_3 or SO_2 in the gas stream. The typical SO_2 reduction in a scrubber is about 90%. The NH_3 removal is governed by the equilibrium between the gas and the scrubber slurry liquid. Figure 2 provides the NH_3 gas-liquid equilibrium graph at a pH of 6. The NH_3 remaining in the effluent can be up to 10 ppm depending on the type of scrubber, the pH set point in the scrubber, and the scrubber influent NH_3 concentration. The remaining SO_2 and NH_3 in the scrubber effluent could react with the NH_4Cl aerosols already present in the gas and further increase plume visibility.

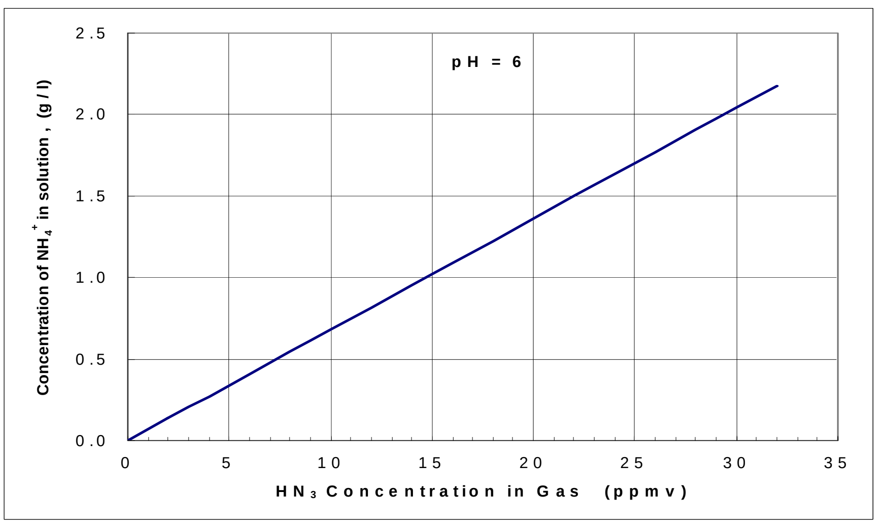

Figure 2. Concentration of NH_4^+ versus HN3 Concentration in Gas

- The gas temperature after the scrubber is much lower than the kiln gas temperature. Besides the aerosols formed at the inlet of the scrubber, more aerosols may also form in the cold and wet stack, and therefore, increase opacity.

Several scrubber vendors have confirmed the above phenomena with scrubber use:

- As an example, a vendor evaluated building a wet scrubber for one of Holcim's PH/PC plants. A PH/PC kiln system typically has two gas effluent streams, one contains high NH_3 (main stack) and the other contains high HCl (by-pass stack). Usually, both streams are introduced to a control device at the same inlet,

However, in this situation, the vendor provided the following concerns/comments in doing so as part of a feasibility study for the plant[1]:

> *"Mixing the NH_3 and HCl streams at the inlet will indeed produce an NH_4Cl salt that will be submicron in size".*
>
> *"This will result in opacity, I am sure it will be greater than 20%. Once this salt is formed, it will be very difficult to remove. Therefore, the preferred treatment would be to absorb the gases before they have a chance to react".*
>
> *"As we discussed, the two separate gas streams can be treated with individual scrubbers. However, it would be less expensive to perform the scrubbing in a single, large vessel with two separate inlet barrel"*

The scrubber system was ultimately built by Monsanto. And, even though the problem was acknowledged, and the system was designed to prevent the visible plume problem, the plant still has challenges with plume formation during the winter.

<u>Kiln gas emission concentrations and opacity</u>

- Holcim, as well as other companies, have found that at about 5ppm NH_4Cl or 10ppm $(NH4)_2SO4$, detached plumes can form outside of the stack if the stack gas is not hot enough to allow for significant dilution prior to condensation or if it is a very cold day in winter. Both aerosols will form quickly when the stack gas is cooled down by very cold ambient air.

- Stack temperatures for wet kilns are typically about 350 F. PH/PC kilns have similar stack temperatures when their in-line raw mills are not running. During these periods, PH/PC kilns have also observed a higher frequency of visible plumes as the precursors, NH_3, HCl and SO2, are not absorbed in the in-line raw mill.

Some specific examples of plants with visible plumes caused by constituents with concentrations similar to those in the Clarksville plant include:

- The CEMEX plant at Cementos Guadalajara, a 4 stage PH/PC kiln, had a highly visible plume caused by NH_4Cl. To resolve the problem, the plant added two additional stages that increased pollutant adsorption (HCl emissions were reduced to 5 ppm) and the plume disappeared. The reported stack temperature is 260 C (500 deg. F) which is much hotter than that of Holcim's Clarksville plant. Further, Clarksville's long wet kiln does not have the benefit of the stages in the PH/PC kiln for enhanced adsorption.

[1] *Steven Meyer, product Manager of Monsanto Company. Letter to Holcim for feasibility study of wet scrubber project, 10/29/1998*

- Holcim's Mississauga plant had a highly visible plume during the winter until they eliminated condensed moisture formation by heating the gas and reducing the HCl concentrations to less than 3-5 ppm. Holcim's Clarksville kiln can have HCl concentrations much higher than 5 ppm as will be discussed in a following section.

- Holcim's Untervaz plant in Switzerland has a wet scrubber as well as high levels of HCl and NH_3 in the kiln gas, and they have reported visible plumes during the winter especially when the in-line raw mill is down and the pollutant concentrations are higher.

Impact of Temperature on Visibility – Reaction Rate Based Equations

Solid NH_4Cl aerosols can form directly from the gas phase through the following reversible chemical reaction when the temperature drops:

$$NH_4Cl\ (s) = HCl\ (g) + NH_3\ (g)$$

The thermodynamic criteria for the reaction to occur is determined by the equilibrium constant Kp, which can be expressed by the following equation[2]

$$\ln Kp = 34.266 - 21196/T$$

where T is the temperature (K). The chemical reaction takes place if the product of partial pressures of HCl and NH_3 in gas is greater than Kp, i.e. $(pHCl \cdot pNH_3) > Kp$ (pHCl & pNH_3 are both in atm). This reaction can keep going to form NH_4Cl until the partial pressures of NH_3 and HCl have dropped to a level such that their product is less than Kp.

If the CV plant utilized a wet scrubber, and we assume the scrubber inlet temperature after quenching is 170 deg F or 76.6 deg C, the Kp would be 3.6 E-12. In the kiln gas, concentrations as low as 1-2 ppm (1.0 E-06 - 2.0 E-6) NH_3 and HCl will make the $(pHCl \cdot pNH_3) > Kp$, and the reaction will not stop until both gas phases drop down to 1-2 ppm. Thus, almost all NH_3 and HCl with a concentration higher than 1-2 ppm in the kiln gas will form NH_4Cl aerosols in the scrubber.

Reheating the stack gas after the scrubber has two purposes:

1) Dissociate the newly formed NH4Cl solid

2) Prevent the formation of aerosols from NH_3 and HCl from forming again in the stack or near the stack. The higher the reheating temperature, the longer the

[2] P. Goldfinger, G. Verhaegen, "Stability of the Gaseous Ammonium Chloride Molecule", The Journal of chemical Physics, 50(1), 1467-1471 (1969)

gas has to disperse and be diluted with ambient air, so that the product of both NH_3 and HCl concentrations would not be higher than Kp, and no aerosol formation would occur.

An example of how reheating temperature affects the opacity in a power plant is depicted in Figure 3[3]. The precursor of the visible plume in this case is SO_3, (as opposed to NH_4Cl).

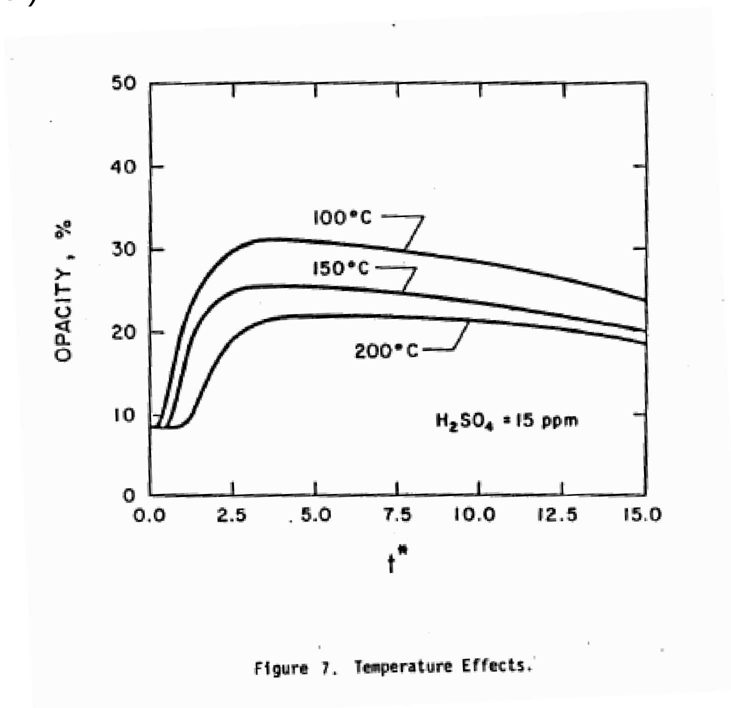

Figure 3. Gas Temperature Effect on Opacity Verses Time (t*)

Although reheating the stack gas to a temperature above the acid gas dew point may help to reduce corrosion problems and in-stack opacity, it may not be enough to avoid a plume outside of the stack. When the gas exits the stack, the temperature will quickly drop to below the acid dew point. Acid gas may be condensed, and acid water droplets may occur that will speed up other reactions in the liquid phase.

Figure 4 shows an example for stack gas containing SO_3. The gas temperature in the stack is much higher than the acid dew point, but once it goes out of the stack it takes only one second for the plume temperature T_P to drop below the dew point temperature T_{DP} and cause higher opacity levels.

[3] J. J. Martin Hughes, "Fine Particle Model for Detached Plume Opacity", Virginia State University, 16th Annual Meeting of the Fine Particle Society, April, 1985.

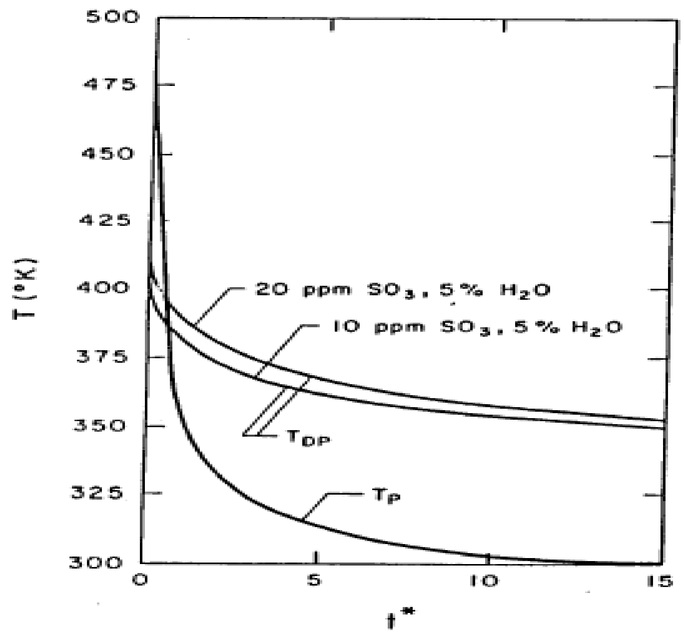

Figure 4. Stack gas temperature vs. Acid Dew Point and Time

Besides pollutant concentrations, other factors such as the stack gas temperature and moisture, the ambient air temperature and humidity, wind speed, sunlight and sky clarity, stack size and height effect plume visibility. Therefore, it is almost impossible to predict the exact reheating temperature required. Regardless, a mathematical model has been established to provide a simplified simulation of NH_4Cl formation outside of the stack based on the actual conditions at the CV plant.

Estimating the Reheat Temperature for CV based on Plant Data

The NH_3 and HCl emission concentration will control the plume formation as SO_2 concentrations are likely to be sufficiently high as to not be limiting in any equations. Table 1 summarizes the CV annual stack testing for 2002 - 2007. Although HCl was relatively low in 2007, it can and has varied significantly over the last five years.

Table 1. HCl and NH_3 Stack Test Data for Clarksville – 2002 thru 2007.

CV Emission		HCl		NH3
	ppmd	ppmw	ppmd	ppmw
2002	**12.8**	9.1	**36.2**	25.7
2003	**30.3**	21.5	**20.6**	14.6
2004	**26.9**	19.1	**27.1**	19.2
2005	**14.4**	10.3	**16.0**	11.5
2006	**8.0**	5.6	**22.5**	15.7
2007	**2.7**	1.9	**24.9**	17.6
Average	15.9	11.2	24.6	17.4

Please note that this data is from once per year stack testing not a Continuous Emission Monitor (CEM) and thus the annual and daily emission levels may vary considerably from these values. Further, the peak annual emission may be much higher than the test average. For example, during the three hours of stack tests in 2004, the maximum hourly HCl concentration was 70% higher than the minimum and 23% higher than the average.

Further, under current operations in 2007, the plant found that during some cold days, the plume outside of the stack was visible, but it did not reach 20% opacity.

The current stack temperature is about 350 F, and the temperature at the outlet of the ESP is about 380 F. The lower temperature in the stack is due to heat loss in the ductworks and the I.D. fan. Therefore, a reheating temperature of 380 F is proposed to maintain the current stack temperature of 350 F and eliminate the plume formation after the scrubber.

Using the 2007 stack test data (2 ppm HCl and 18 ppm NH_3), a reheat temperature of 380 F, or 350 F stack temperature, might not be necessary since based on our modeling result, the total HCl and NH_3 as aerosols after the scrubber should not be higher than in the original kiln gas.

However, HCl concentrations in the prior years have been as much as 10 times higher than 2007, reaching over 20 ppm in 2003 and 2004, while the NH_3 concentrations were nearly 20 ppm. These levels are considered to be highly probable of causing a visible plume at the current exhaust temperatures. Reviewing historical data, it was found that stack temperatures during these time periods were much higher than current temperatures. For example, the stack temperature was maintained at approximately 700 deg. F in 2003 and approximately 450 deg F (480 deg F at the outlet of the ESP) in 2004 (100 F higher than the proposed reheating temperature). The higher temperatures likely prevented significant visible plumes from occurring.

Regarding the use of a wet scrubber, even if some reduction in HCl occurred (such as 20%), the total HCl concentration after the scrubber would still be significantly higher than that in the kiln gas in 2007. Under this scenario, reheating to an ESP outlet of 380 F, or 350 F stack temperature, would likely not be sufficient to assure a stack opacity below 20% and additional re-heating would likely be required. Consequently, the proposed 380 F reheating temperature should be considered as an average for the year. That is, if the HCl and NH_3 concentrations reach 20 ppm in the kiln gas, the reheat temperature may need to be 480 deg F or higher in the winter, while if the HCl and NH_3 concentrations drop to 2007 levels or below, a reheat temperature of less than 380 deg F may be sufficient in the summer. Therefore, considering the variation in the HCl and NH_3 concentrations, an annual average reheat temperature of 380 deg F may be sufficient.

Is scrubbing half of the exhaust stream, and using the unscrubbed half for reheat, a viable option?

A scenario in which half or the exhaust gas stream is scrubbed, and the other half is not, followed by recombining the gas streams, was also considered. If feasible, this scenario would result in the unscrubbed gas providing the heat source to re-heat the scrubbed gas up to a temperature midway between the scrubbed gas temperature of approximately 170 deg F and the unscrubbed gas temperature of approximately 380 deg F, resulting in a mid-range temperature gas stream of approximately 275 deg F. Unfortunately, as discussed previously, the variability in precursor pollutant (HCl and NH_3) concentrations would most certainly lead to a visible plume at this low temperature and re-heating would continue to be required up to the originally identified average temperature of 380 deg F. This option was one of the scenarios evaluated in the modeling exercise discussed in the following sections.

Mathematical analysis of the impact of reheating temperature on CV visible plume

Using the equation described previously,

$$\ln K_p = 34.266 - 21196/T$$

a mathematical model was established to simulate NH_4Cl formation outside of the stack. Based on Holcim's experience with visible plumes at multiple plants, an NH_4Cl aerosol concentration of 5ppm in the atmosphere is used as the criteria for a highly visible plume outside of the stack. In reality, some of Holcim's plants control their NH_4Cl aerosol concentrations to less than 1-3 ppm to avoid visible plume formation.

This model only considers the gas temperature reduction due to mixing with ambient air and does not consider any reduction due to radiation. Thus, the actual condition will be worse than what the model predicts.

NH_4Cl formation was simulated for the following scenarios:

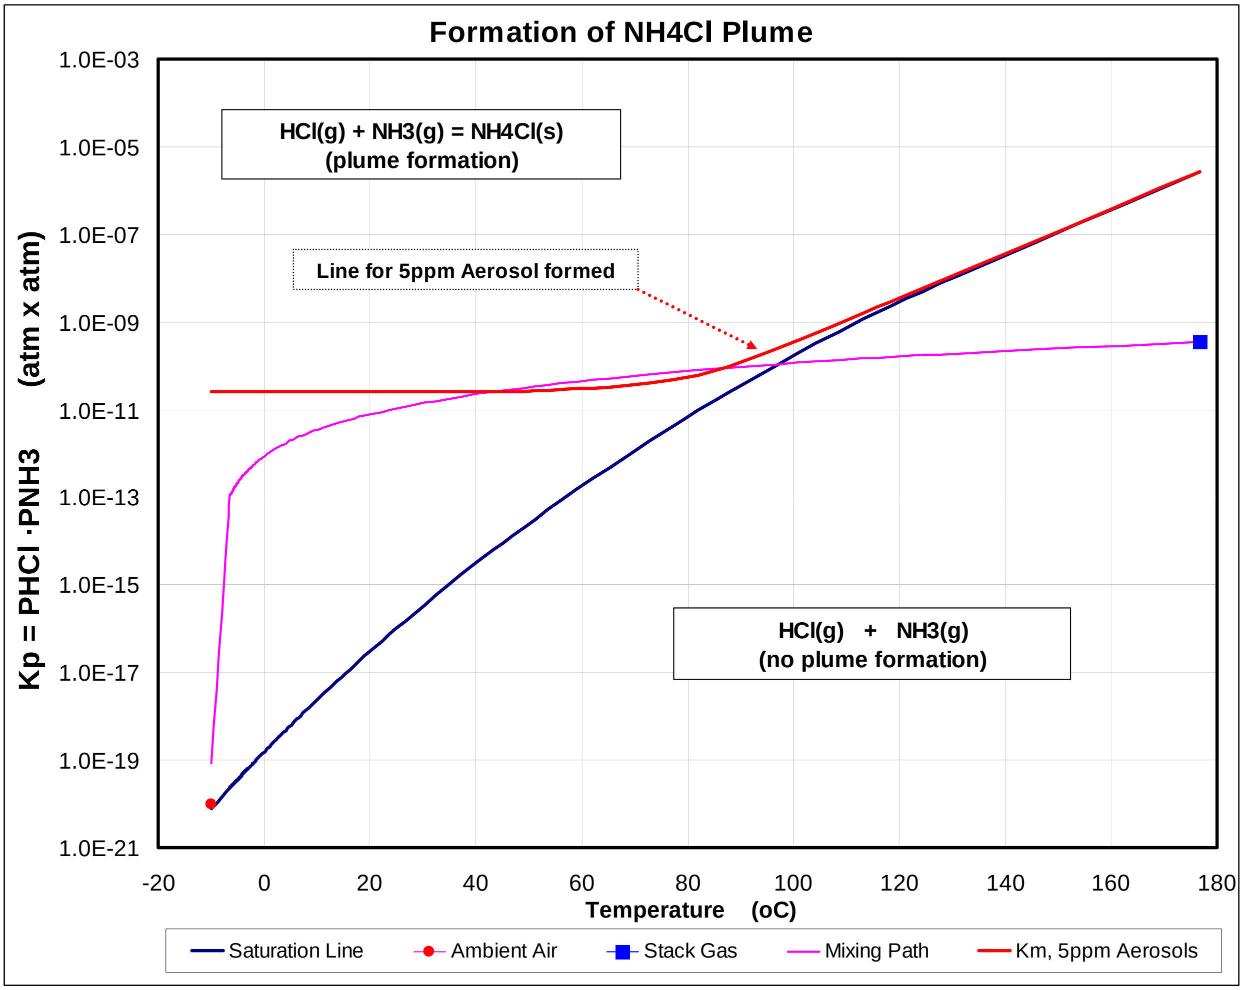
- Scenario 1. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating to 380F and Winter Condition
- Scenario 2. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating to 380F and Summer Condition
- Scenario 3. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and Winter Condition
- Scenario 4. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and winter Condition
- Scenario 5. Average of the NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and winter Condition

- Scenario 6. Average of the NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and summer Condition
- Scenario 7. Average of the NH_3 and HCl concentrations for the last 4 years, reheating of 380 F and summer Condition
- Scenario 8. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating to 480F and Winter Condition

Additional Model Assumptions/Calculations:

The model assumes that in each interval 50% of the original stack gas volume will be diluted with ambient air. Based on this dilution, and with respect to the ambient and stack gas specific heat, the temperature of the mixture will be calculated. Next, the Kp line which represents the equilibrium condition is drawn by inserting the temperature in the above formula. The corresponding concentration of HCl and NH_3 of the gas mixture is calculated at each interval, converted to partial pressures and multiplied with each other to find the Mixing Path value (Km). The Mixing Path (Km) at the corresponding temperature represents the calculated gas conditions at that interval. Then the Km+5 line which corresponds to the concentration of NH_3 and HCl that will result in the formation of at least 5 ppm of aerosols is drawn,. At any point that the Mixing Path and Km+5 lines cross each other at least 5 ppm of aerosols has been formed.

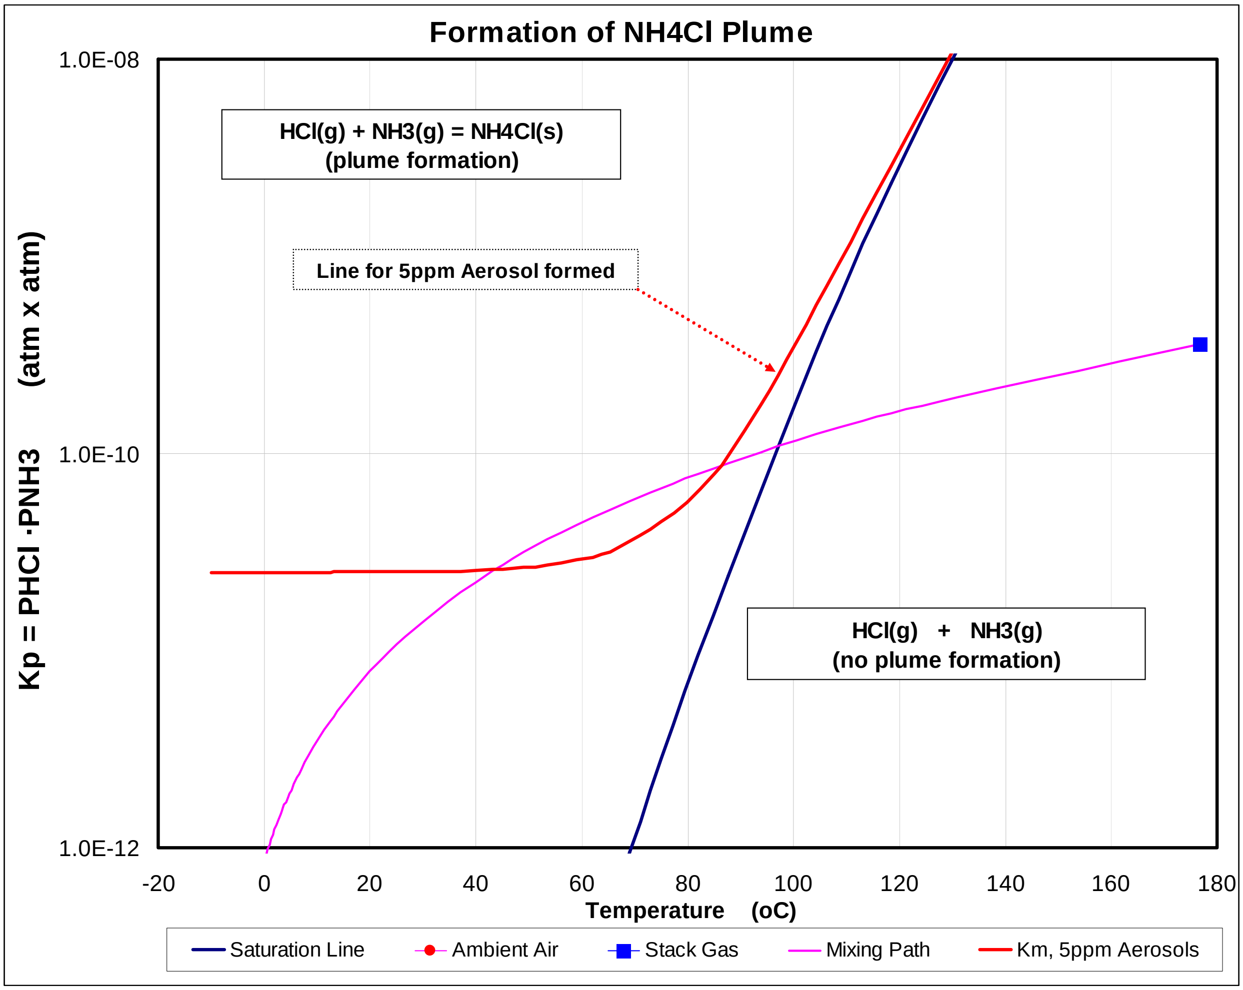
Scenario 1 (Figure 5) represents the 380°F reheating temperature and stack temperature of 350°F, an ambient temperature of 14°F (representing a typical winter temperature), and the five year maximum NH_3 and HCl concentrations of 27 ppmv, dry. Furthermore, it shows that the Km and Mixing path lines cross at around 85°F and will form more than 5 ppm of aerosol NH_4Cl. Thus, a visible plume would be predicted.



Conditions	° F	° C
Ambient Air Temperature	14	-10
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 5

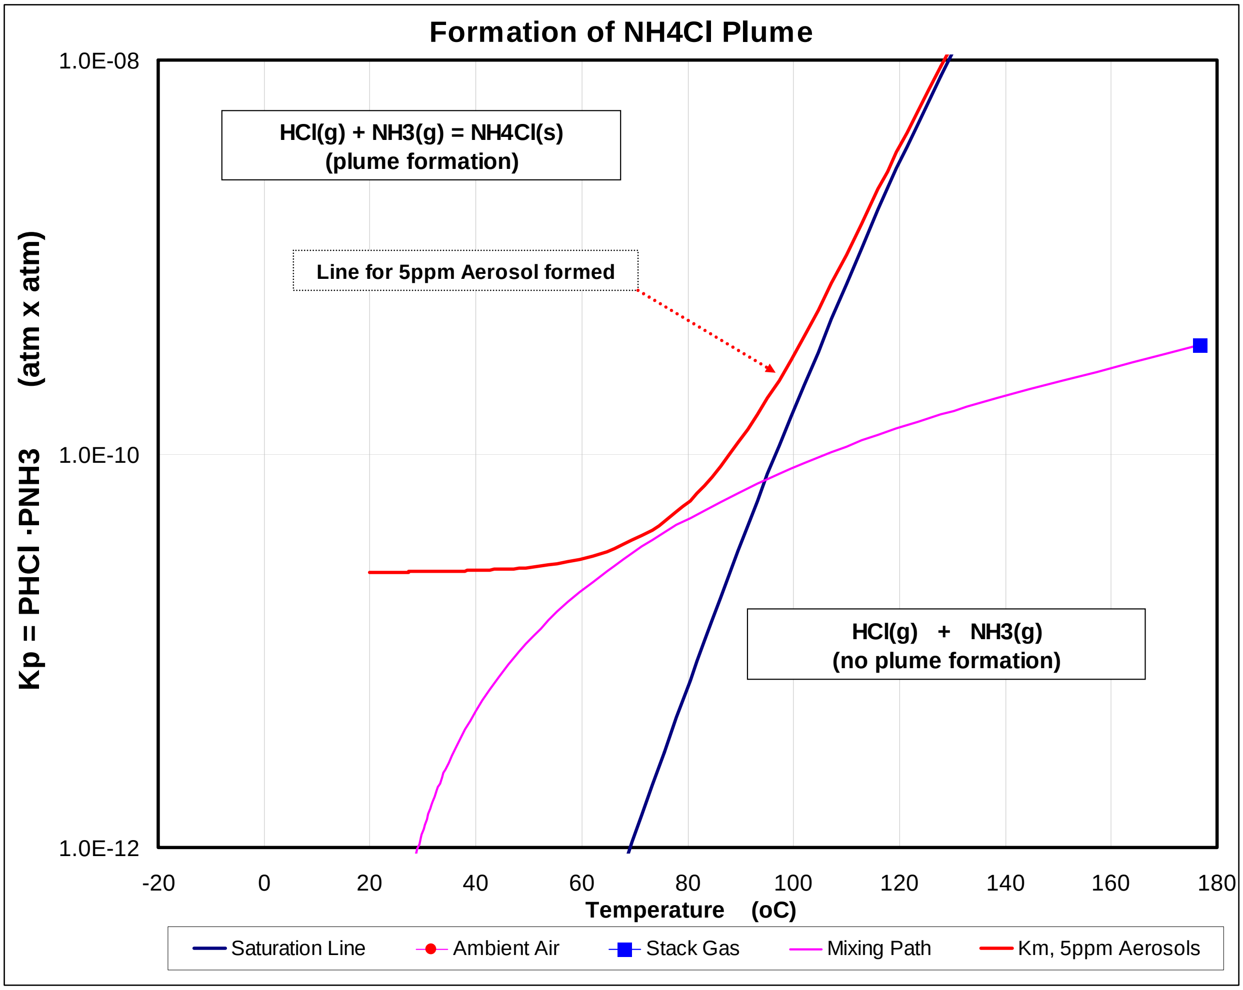
Figure 6 has the same ambient and stack temperatures as well as pollutant concentrations as Scenario 1, but provides more detail (zoomed in view) where the Km and Mixing Path lines cross.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 6

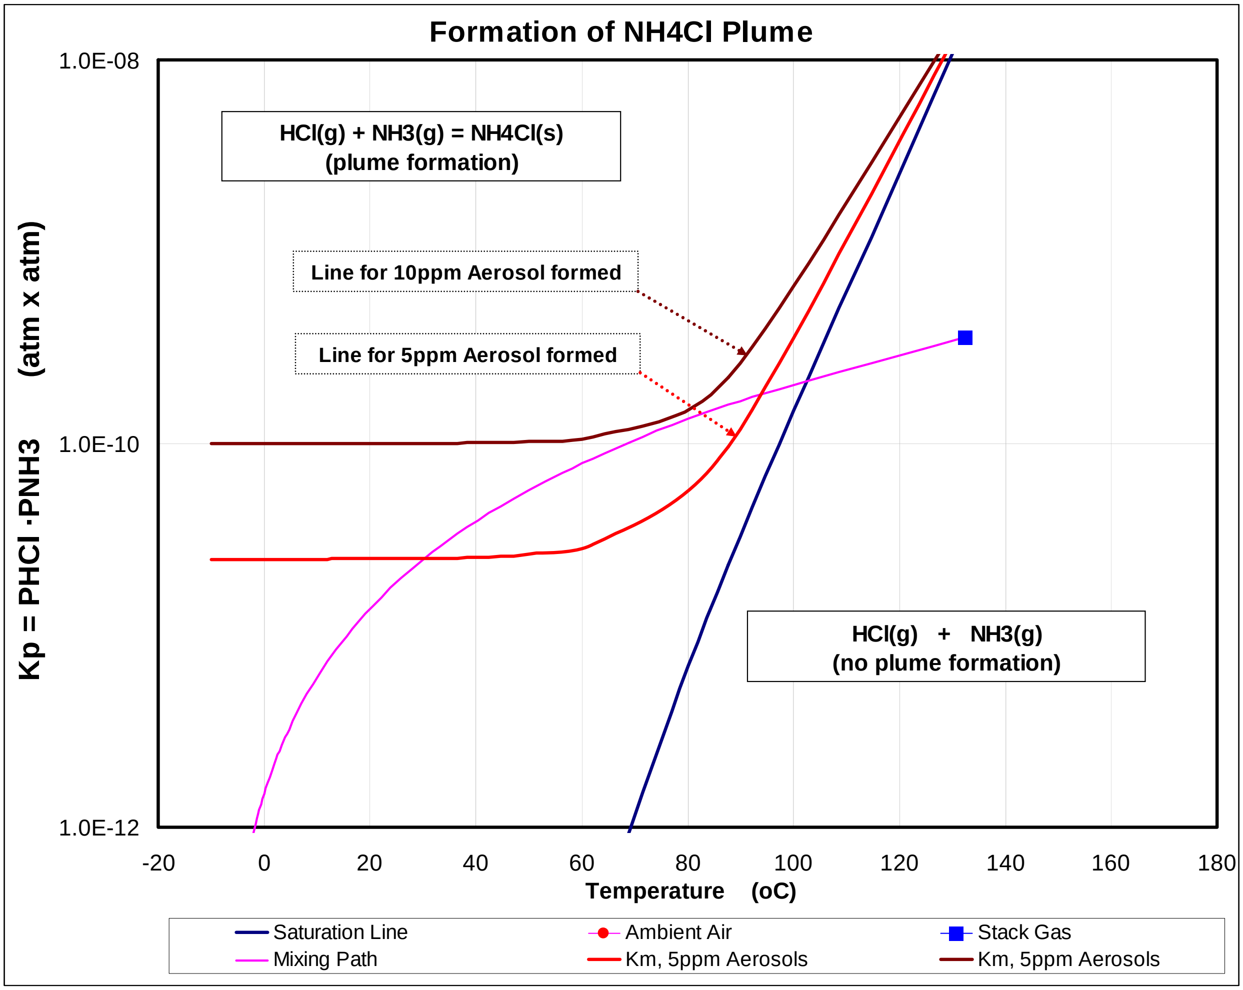
Scenario 2 (Figure 7) represents the situation in Figures 5 & 6 (380 F reheating and 350 F stack temperature) but at a typical spring/summer temperature of 68°F. At these conditions, the Mixing Path barely misses the line representing 5 ppm aerosol NH_4Cl formation. Thus, a visible plume formation is not anticipated.



Conditions	°F	°C
Ambient Air Temperature	68	20
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 7

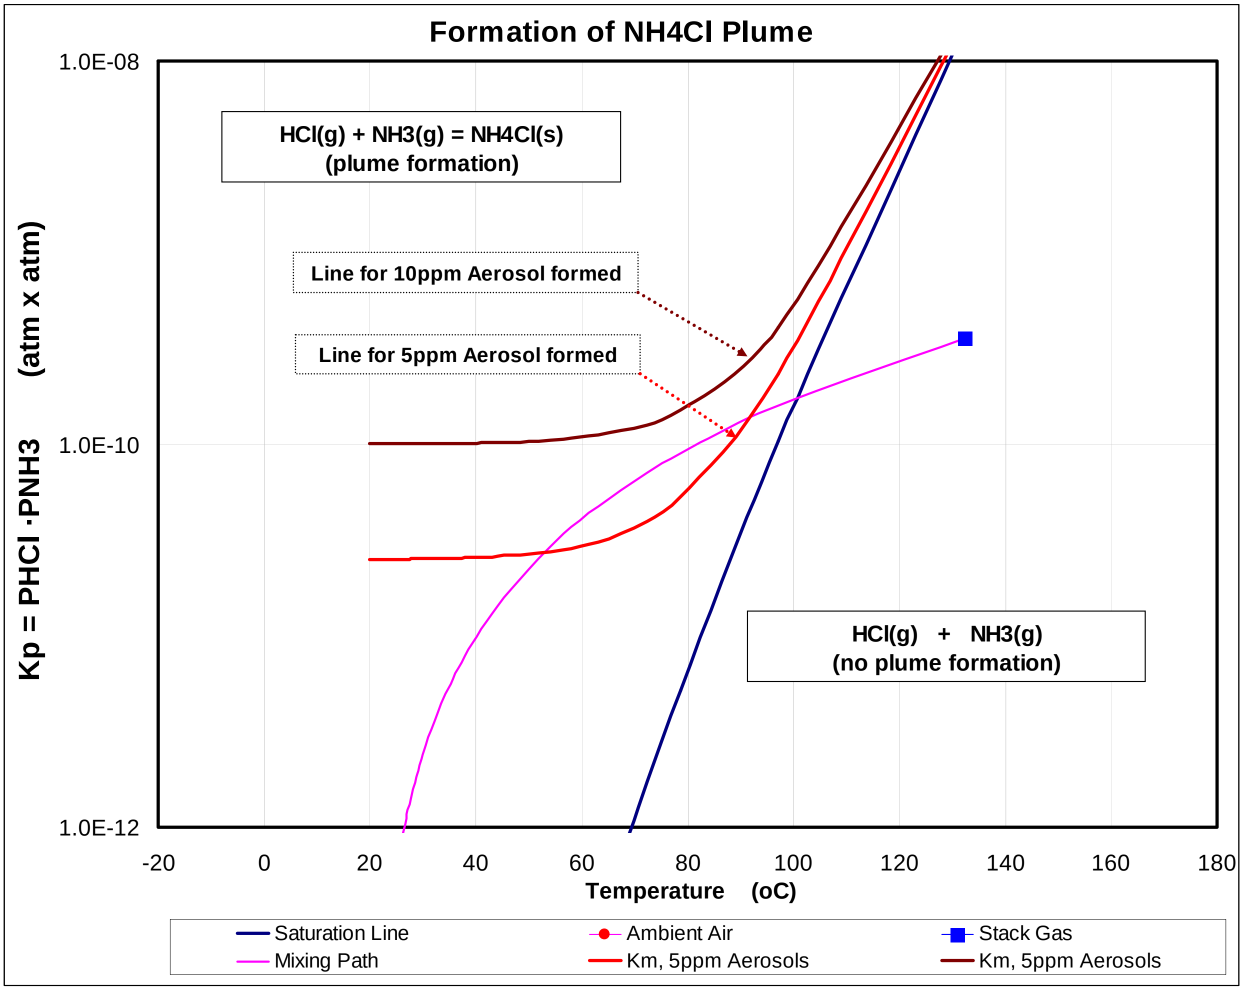
Scenario 3 (Figure 8) provides a reheating gas temperature of 300 °F corresponding to a stack temperature of 270 °F and the maximum 5 year pollutant concentration of 27 ppmv, dry at winter ambient conditions. At this stack temperature, the Mixing Path crosses the 5 ppm aerosol NH_4Cl formation line and nearly crosses a 10 ppm aerosol NH_4Cl line. This scenario has a very high risk of a visible plume problem with >20% opacity.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 8

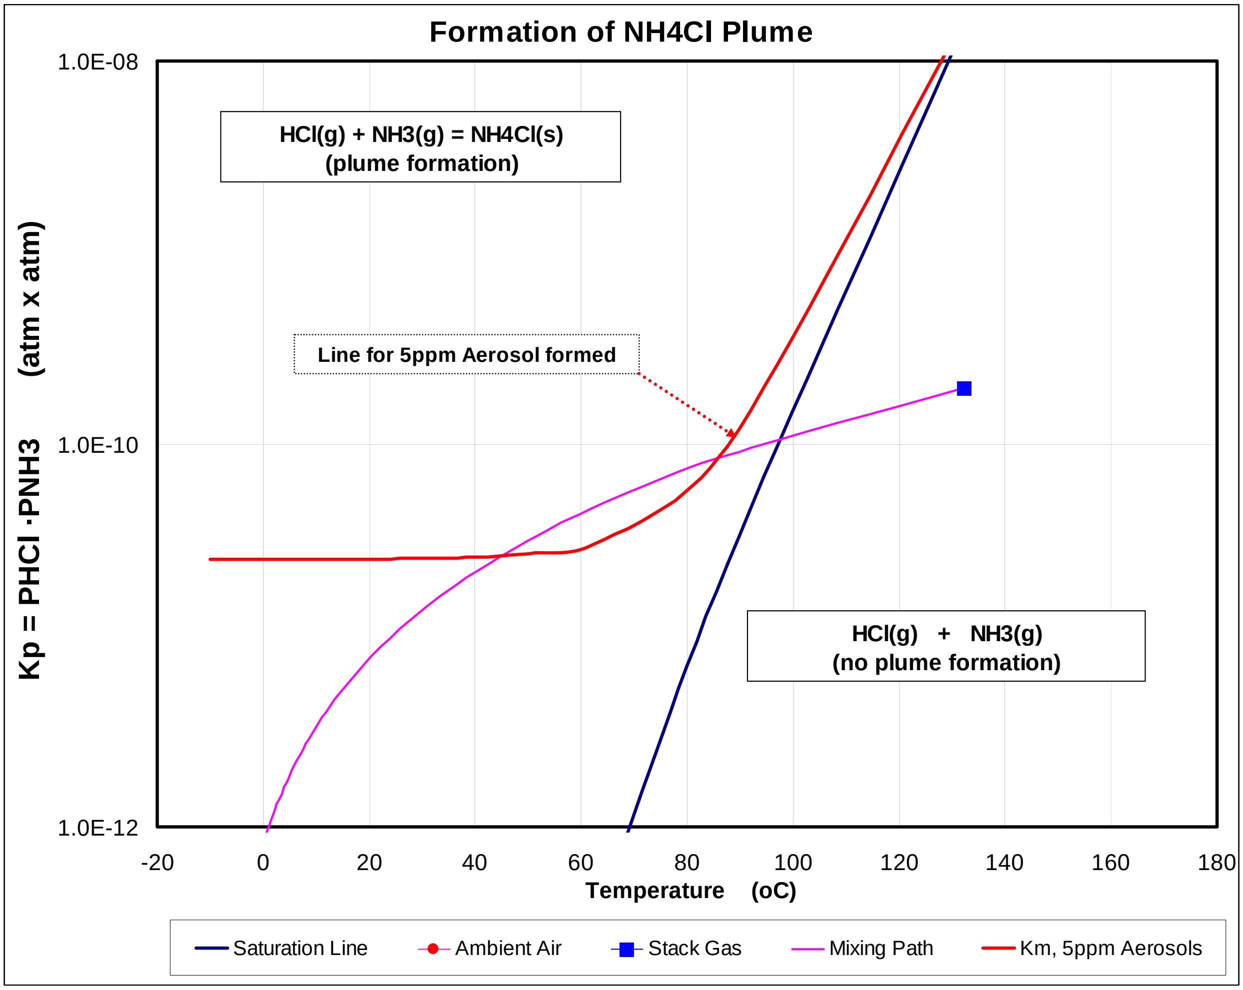
Scenario 4 (Figure 9) provides a reheating gas temperature of 300 °F corresponding to a stack temperature of 270 °F and the maximum 5 year pollutant concentration of 27 ppmv, dry (same as Scenario 3) but at typical spring/summer ambient temperatures. At this stack temperature, the Mixing Path still crosses the 5 ppm aerosol NH_4Cl formation line. This scenario also has a high risk of a visible plume problem. However, it is not predicted to be as severe as the previous scenario.



Conditions	°F	°C
Ambient Air Temperature	68	20
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

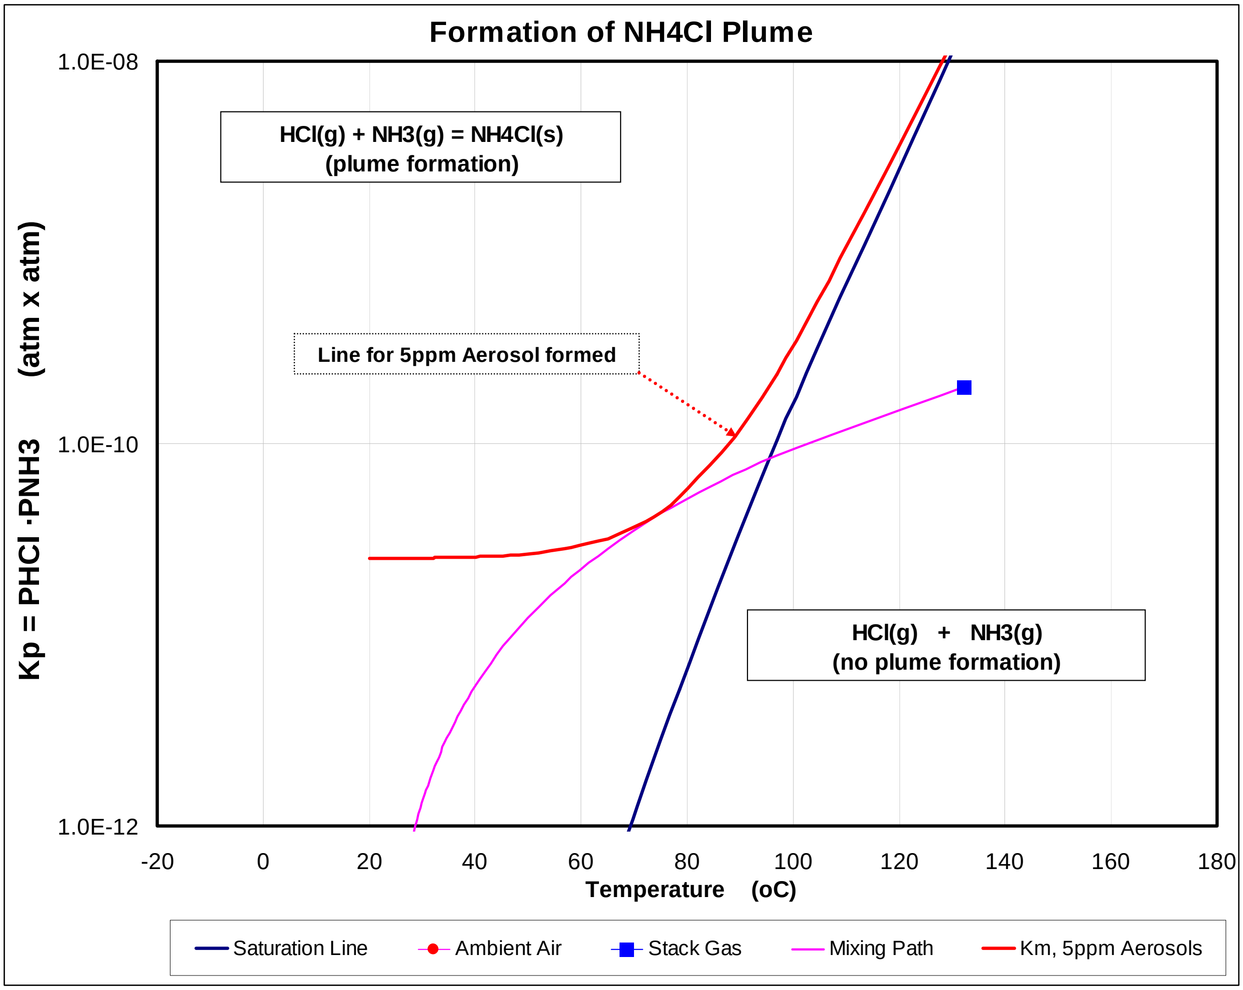
Figure 9

Scenarios 5 and 6 (Figure 10 and Figure 11). Under these temperatures, the average 5 year concentration of NH_3 (25 ppmv, dry) and HCl (16 ppmv, dry) is predicted to form more than 5 ppm of aerosol NH_4Cl at an average winter temperature (Figure 10) and close to 5 ppm at an average summer (Figure 11) ambient temperature.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	16	
NH_3 Concentration (ppmv, dry)	25	

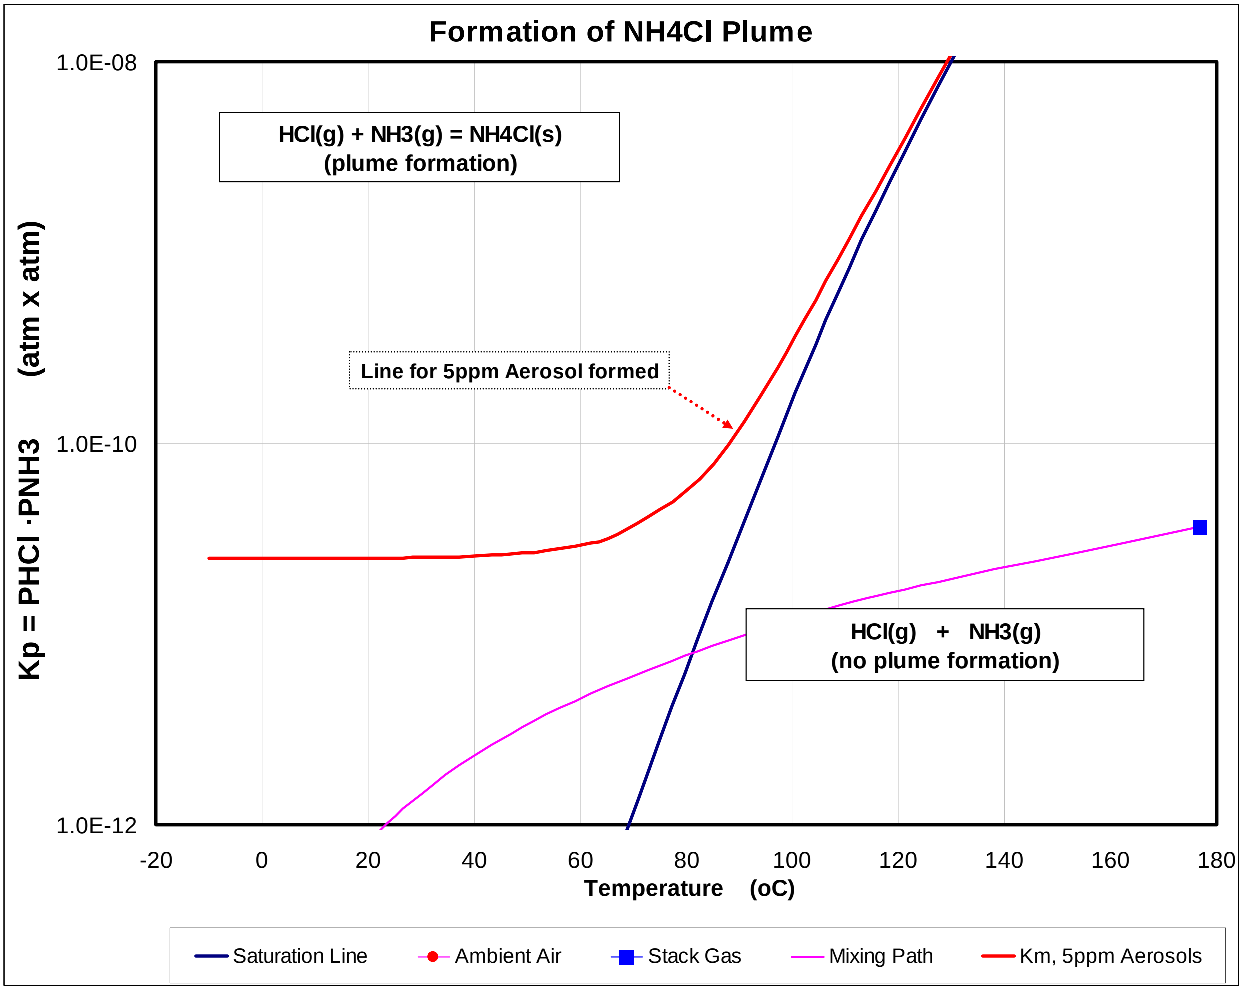
Figure 10



Conditions	°F	°C
Ambient Air Temperature	68	20
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	16	
NH_3 Concentration (ppmv, dry)	25	

Figure 11

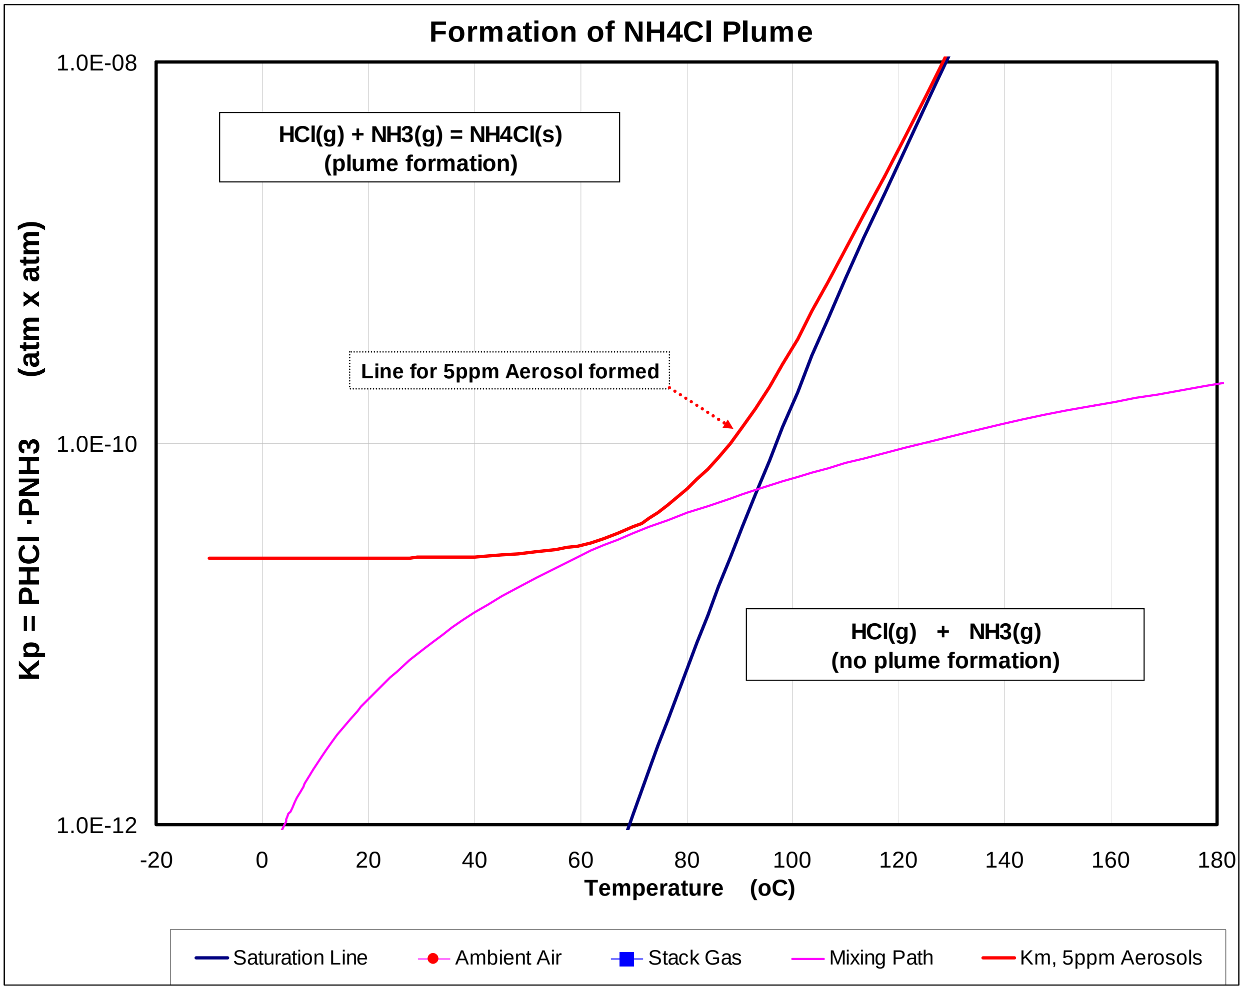
Scenario 7 (Figure 12) represents the actual 2007 condition of the Clarksville plant at a typical winter temperature. It is apparent that the Mixing Path line and Km are not crossing since the total HCl concentration is only 3 ppm. Note that the HCl concentration in 2007 was the lowest of the 5 years and could vary to more than 30 ppm as found in 2003.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	3	
NH_3 Concentration (ppmv, dry)	25	

Figure 12

Scenario 8 (Figure 13) shows the actual 2004 conditions of the plant at a typical winter ambient condition. Although the HCl and NH_3 concentrations are relatively high, the high stack temperature (480 deg F) allows for dilution and the Mixing Path line does not cross the Km line and therefore less than a 5 ppm aerosol NH_4Cl concentration is predicted.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	480	249
Stack Temperature	450	232
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 13

Conclusion

In conclusion, the stack temperature needed to prevent a visible plume from occurring is highly dependent on the ambient temperature, the concentrations of HCl and NH_3 in the gas stream, as well as other factors. Due to the normal variability in HCl and NH_3 concentrations, it is virtually assured that the combination of higher HCl and NH_3 concentrations and lowering the stack gas temperature below current levels (380 deg F at the exit of ESP and 350 deg F at stack) would lead to a visible plume condition.

Supplement A: Some Examples of plume problems in cement Industry

The first regulatory action concerning secondary plumes in the cement industry occurred in 1979 at Glens Falls Cement, Glens Falls, New York, USA. Plume studies were conducted by EPA and stack test contractors by sampling the plume using a tethered balloon.

The secondary plume was observed to have an average opacity of ~85% while the in-stack opacity was only 10%. The tests revealed that the particulate matter recovered from the plume was mainly crystals of ammonium sulphate. The tests indicated that the primary components of the stack effluent were $(NH4)_2SO4$ (4.5 ppm), SO_2 (200 ppm), NH_3 (170 ppm), moisture (20%). The ammonium sulphate in the stack gas was responsible for the 10% in-stack opacity.

The secondary plume was also observed at Lehigh Cement in Leeds, Alabama, USA. Testing conducted in 1981 indicated that the major species responsible for the plume was ammonium chloride, NH4Cl.

Similar tests were conducted in 1987 at Kaiser Cement in Permamenti, California, USA. The results revealed that NH4Cl was also responsible for the visible secondary plume. The secondary plume tests conducted in 1987 at Southwestern Portland Cement in Victorville, California, USA, also revealed that NH4Cl was responsible for the visible secondary plume.

In 1986, EPA conducted a source and process sampling program at the South Dakota Cement Company, Rapid City, South Dakota, USA. The samples collected from the secondary plume contain up to 67% NH4Cl. Further tests indicated that the NH3 exists mainly in the shale that accounts for about 20% of raw mix. The plant has a dry process with a 4-stage preheater, vertical roller mill for raw grinding and a main baghouse for dedusting. A severe ammonia recirculation was observed, with an average NH3 content in shale being 6.2 ppm while up to 159 ppm NH_3 was found in the baghouse dust. It was also observed that the NH3 content in the baghouse dust was reduced substantially when gas temperature increased from 170 deg C (compound operation) to 250 deg C (direction operation).

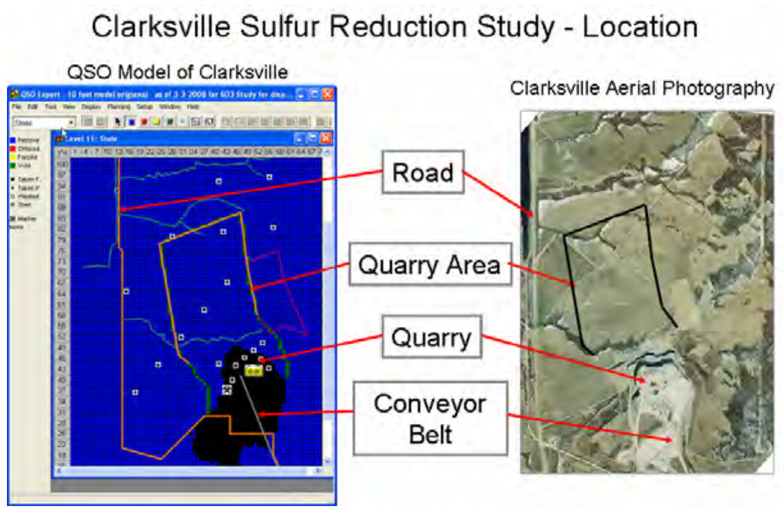
The secondary plumes in cement plants are not limited to the USA. They have also been reported by a Mexican cement company which determined through plant measurements that NH4Cl was responsible for the visible plume.

Other examples include the Lone Star Industries' Cape Girardeau Cement Plant, MO, USA and the Inland Cement, Edmonton, AB, Canada. Both plants experienced secondary plumes due to formation of ammonium sulphate.

APPENDIX C. SELECTIVE MINING – QUARRY SCHEDULING OPTIMIZATION DISCUSSION

Appendix C. Selective Mining – Quarry Scheduling Optimization Discussion

Holcim (US) Inc. evaluated the Clarksville Quarry Scheduling Optimization (QSO) model for sulfur emissions.

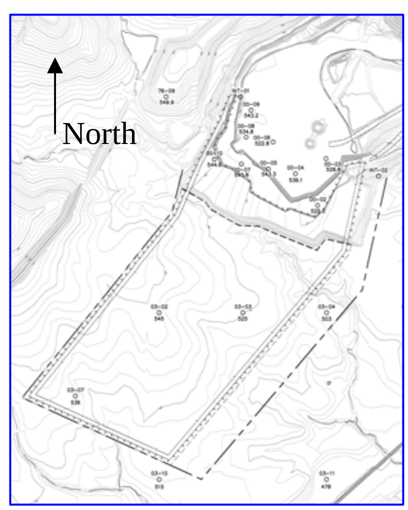


The model is based on statistical and spatial analysis of data obtained through drill core sub sampling. Validation of relevant data is insured through the analysis of varagrams and histograms. This validation insures that correlation between samples is relevant.

The Clarksville QSO Model was created specifically for predicting relevant mineralogical parameters related to clinker production. Major oxides (Ca, Mg, Si, and Fe) are the primary focus of this predictive model. The sampling protocol and data analysis required for major oxide components was never intended to be adequate for the accurate prediction of minor components, such as sulfur and sulfur compounds.

When placed under scrutiny, existing data was found to be inadequate for accurate prediction of S content in the potentially quarried shale. Spatial relationships between core samples were found to be inappropriate for the sensitivity needed to make accurate predictions. The reason for this is the geologic nature of the Maquiketa Shale and Kimmswick Limestone, of which the primary sulfur mineral is pyrite (FeS).

One of the most important chemical processes in organic-rich marine sediments, such as Maquiketa shale, is decomposition of organic matter (OM)in bacterial sulphate reduction. Bacterial sulphate reduction produces bisulphide. Bisulphite can be partially oxidized or can react with OM and reactive metal species. All these reactions may be bacterially mediated. The reaction of reduced sulfur with reactive dissolved iron and iron minerals, if available, results in the formation of iron sulphides. The most common iron sulphide in pyrite.



The amount of pyrite formation in marine sediments is largely determined by the availability of sulphate, reactive iron and reactive OM during the formation of

the sediments. The locations of the reactive iron and sulphate are a random occurrence, usually along planes of weakness or channels of solubility during rock forming (induration). The pyrite is formed as nodules or clusters of mineralization and is not evenly distributed spatially throughout the shale and limestone.

Therefore the chance of intercepting a pyrite cluster of mineralization by core drilling is known as a ‘nugget’ effect. Intercepting a pyrite cluster will give artificially high sulfur values in the model and, conversely, not intercepting pyrite mineralization can give low values.

In the planned mining area only 5 core holes were drilled (DH-2, DH-3, DH-4 and DH-7). While the spacing of the drill holes are adequate for predicting major oxides, they are too far apart and too few to accurately predict clustered mineralogy such as pyrite.

APPENDIX D. BART CONTROL COST TABLES

Table D-1. Wet Limestone Scrubber Control Cost Analysis Based on Projected Actual Emissions and 80% Control.

Direct Costs			
Purchased Equipment Costs			
	Wet Scrubber Unit including Limestone Prep System, inflated to 2012 dollars		$17,317,574
	Instrumentation (10% of EC)		$1,731,757
	Freight (5% of EC)		$865,879

TABLE OF CONTENTS

LIST OF TABLES

1. EXECUTIVE SUMMARY

This report documents the determination of the Best Available Retrofit Technology (BART) as proposed by Holcim (US) Inc. (Holcim) for the Portland cement manufacturing plant located in Clarksville, Missouri (Clarksville plant). This analysis is for the kiln system. Currently, particulate matter emissions from the kiln are controlled by an electrostatic precipitator. The Clarksville plant has other lesser emitting BART-eligible emissions units, all of which have Particulate Matter Control Devices (PMCDs) installed. The negligible visibility impairment attributable to these sources concludes that no additional controls are necessary to satisfy the requirements of the BART rule.[1]

Holcim used the U.S. Environmental Protection Agency's (EPA's) guidelines[2] in 40 CFR Part 51 to determine BART for the kiln. Specifically, Holcim conducted a five-step analysis to determine BART for SO_2, NOX, and PM_{10} that included the following:

1. Identifying all available retrofit control technologies;
2. Eliminating technically infeasible control technologies;
3. Evaluating the control effectiveness of remaining control technologies;
4. Evaluating impacts and document the results;
5. Evaluating visibility impacts

Based on the five-step analysis, Holcim proposes the following as BART:

Kiln:

- PM_{10} – Holcim has determined that the existing electrostatic precipitator constitutes BART. This control device is effective for controlling PM_{10} from a wet kiln.

- NO_X – Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system or equivalent technologies that will achieve a 20 percent reduction in the maximum daily NO_X emission rate of 73,185 lbs that was used for visibility impact modeling.

- SO_2 – Holcim proposes that BART for the Holcim Clarksville Kiln is fuel substitution or equivalent technologies that will achieve a 23 percent reduction in the maximum daily SO_2 emission rate of 117,345 lbs that was used for visibility impact modeling.

The proposed BART control strategies will result in reductions of the visibility impacts attributable to the Clarksville plant. A summary of the visibility improvement at Class I areas based on the existing emission rates and proposed BART emission rates is provided in Table 1-1.

[1] Holcim submitted an inventory of all of the BART-eligible emission sources to the MDNR. Based on a review of this information, the MDNR concluded that the contributions from particulate matter from the non-kiln sources to visibility impairment is negligible and further analysis of these smaller particulate matter sources was not required. Meeting with the MDNR dated January 23, 2008.

[2] 40 CFR 51, Regional Haze Regulations and Guidelines for Best Available Retrofit Technology (BART) Determinations

TABLE 1-1. VISIBILITY IMPAIRMENT IMPROVEMENT

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
BART 98% Impact (Δdv)	0.79	0.64	0.48
Improvement 98% Impact (Δdv)	22%	21%	22%

2. INTRODUCTION AND BACKGROUND

On July 1, 1999, the U.S. EPA published the final Regional Haze Rule (RHR). The objective of the RHR is to improve visibility in 156 specific areas across with United States, known as Class I areas. The Clean Air Act defines Class I areas as certain national parks (over 6000 acres), wilderness areas (over 5000 acres), national memorial parks (over 5000 acres), and international parks that were in existence on August 7, 1977.

On July 6, 2005, the EPA published amendments to its 1999 RHR, often called the Best Available Retrofit Technology (BART) rule, which included guidance for making source-specific BART determinations. The BART rule defines BART-eligible sources as sources that meet the following criteria:

(1) Have potential emissions of at least 250 tons per year of a visibility-impairing pollutant,
(2) Began operation between August 7, 1962 and August 7, 1977, and
(3) Are included as one of the 26 listed source categories in the guidance.

A BART-eligible source is subject to BART if the source is "reasonably anticipated to cause or contribute to visibility impairment in any federal mandatory Class I area." EPA has determined that a source is reasonably anticipated to contribute to visibility impairment if the 98^{th} percentile visibility impacts from the source are greater than 0.5 delta deciviews (Δdv) when compared against a natural background. Air quality modeling is the tool that is used to determine a source's visibility impacts.

Once it is determined that a source is subject to BART, a BART determination must address air pollution control measures for the source. The visibility regulations define BART as follows:

> *"…an emission limitation based on the degree of reduction achievable through the application of the best system of continuous emission reduction for each pollutant which is emitted by…[a BART-eligible source]. The emission limitation must be established on a case-by-case basis, taking into consideration the technology available, the cost of compliance, the energy and non air quality environmental impacts of compliance, any pollution control equipment in use or in existence at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonable be anticipated to result from the use of such technology.*

Specifically, the BART rule states that a BART determination should address the following five statutory factors:

1. Existing controls
2. Cost of controls
3. Energy and non-air quality environmental impacts
4. Remaining useful life of the source
5. Degree of visibility improvement as a result of controls

Further, the BART rule indicates that the five basic steps in a BART analysis can be summarized as follows:

1. Identify all available retrofit control technologies;
2. Eliminate technically infeasible control technologies;
3. Evaluate the control effectiveness of remaining control technologies;
4. Evaluate impacts and document the results;
5. Evaluate visibility impacts

A BART determination should be made for each visibility affecting pollutant (VAP) by following the five steps listed above for each VAP.

BART applicability was determined for the Clarksville plant based on an applicability analysis performed by the MDNR and a refined applicability analysis performed by Holcim. Both analyses determined that the kiln is subject to BART. The details of the applicability determination can be found in Section 3.

Subsequently, Holcim performed an analysis to determine BART for each VAP for the kiln. The VAPs emitted by the kiln include NO_x, SO_2, and particulate matter with a mass mean diameter smaller than ten microns (PM_{10}) of various forms (filterable coarse particulate matter [PM_c], filterable fine particle matter [PM_f], elemental carbon [EC], inorganic condensable particulate matter [IOR CPM] as sulfates [SO_4], and organic condensable particulate matter [OR CPM] also referred to as secondary organic aerosols [SOA]). The BART determinations for SO_2 and NO_X can be found in Sections 4 and 5 respectively.

3. BART APPLICABILITY DETERMINATION

As stated in Section 2, a BART-eligible source is subject-to-BART if the source is "reasonably anticipated to cause or contribute to visibility impairment in any federal mandated Class I area." EPA has determined that a source is reasonably anticipated to contribute to visibility impairment if the 98th percentile of the visibility impacts from the source is greater than 0.5 Δdv when compared against a natural background. The MDNR conducted air quality modeling for the kiln to predict the existing visibility impairment attributable to the Clarksville plant in the following Class I areas:

- Mingo National Wildlife Refuge
- Hercules Glade Wilderness Area
- Upper Buffalo Wilderness Area

Based on this modeling, the MDNR concluded that the Clarksville plant was subject to BART since the 98th percentile of the visibility impacts attributable to the kiln are greater than 0.5 Δdv when compared against a natural background for a Class I area.

The modeling methods and procedures that Holcim followed were consistent with the methods and procedures that were followed in the MDNR's original modeling. Table 3-1 summarizes the emission rates that were modeled for SO_2, NO_X, and PM_{10}[3]. The SO_2 and NO_x emission rates are the highest actual 24-hour emission rates based on 2003-2007 continuous emissions monitoring system (CEMS) data. The PM_{10} emission rates are based on data included in Holcim's BART survey.

TABLE 3-1. MODELED 24-HOUR EMISSIONS (AS AN HOURLY EQUIVALENT)

SO_2 (lb/hr)	NO_X (lb/hr)	Total PM_{10} (lb/hr)
4889.38	3049.38	51.82

Table 3-2 summarizes the stack parameters that were used to model the kiln.

TABLE 3-2. SUMMARY OF STACK PARAMETERS

Parameter	Value
Actual Stack height (ft)	250
Stack Diameter (ft)	21.7
Exhaust Velocity (ft/s)	34.3
Exhaust Temperature (F)	367

The results of the modeling indicate that the 98th percentile of the visibility impacts are greater than 0.5 Δdv when compared against a natural background. Since the visibility impacts are greater than 0.5 Δdv, the kiln is subject to BART. The results of the modeling are summarized in Table 3-3.

[3] The non-kiln PM_{10} emissions were included in the model as part of the kiln PM_{10} emissions.

TABLE 3-3. SUMMARY OF 98TH PERCENTILE VISIBILITY IMPACTS AND NUMBER OF DAYS WITH VISIBILITY IMPACT GREATER THAN 0.5 ΔDV

Class I Area	Visibility Impairment 98th % Δdv	Visibility Impairment Days > 0.5 Δdv
Mingo Wilderness	1.01	75
Hercules Glades Wilderness	0.81	40
Upper Buffalo Wilderness	0.61	33

Table 3-4 provides a breakdown of the visibility impacts listed in Table 3-3 by each VAP for the high (98th percentile) day (note that the specific percentiles vary from day to day, and location to location, the breakdown listed is an example of one event only).

TABLE 3-4. BREAKDOWN OF POLLUTANT SPECIFIC CONTRIBUTIONS TO VISIBILITY FOR THE 98TH PERCENTILE DAY.

Class I Area	Visibility Impairment Attributable to SO_4 (%)	Visibility Impairment Attributable to NO_3 (%)	Visibility Impairment Attributable to SOA (%)	Visibility Impairment Attributable to EC (%)	Visibility Impairment Attributable to PM_c (%)	Visibility Impairment Attributable to PM_f (%)	Total Visibility Impairment (Δdv)
Mingo Wilderness	98.6	1.2	0	0	0	0.2	1.01
Hercules Glades Wilderness	42.3	57.5	0	0	0	0.2	0.81
Upper Buffalo Wilderness	95.7	4.2	0	0	0	0.1	0.61

As shown in Table 3-4, the most significant contributors to the visibility impairment are sulfates (SO_4) and nitrates (NO_3). The SO_4 contribution is from the chemical conversion of SO_2 emitted by the kiln to SO_4. The NO_3 contribution is entirely from the chemical conversion of NO_X emitted from the kiln. The contribution of PM_{10} to the total visibility impairment can be estimated as the sum of the contributions from SOA, EC, PMc, and PMf. The PM_{10} contribution is much smaller (<1%) than the contribution from SO_2 and NO_X.

4. SO_2 BART EVALUATION

Sulfur, in the form of metallic sulfides (pyrite), sulfate, or organosulfur compounds, is often found in the raw materials used to manufacture cement and in the solid and liquid fuels burned in cement kilns.[4] The raw materials and fuels for the Clarksville plant are no exception. Sulfur dioxide can be generated by the oxidation of sulfur compounds in the raw materials and fuels during operation of the pyroprocess. Constituents found in fuels, raw materials, and in-process materials, such as the alkali metals (sodium and potassium), calcium carbonate, and calcium oxide react with SO_2 formed in the pyroprocess and much of the sulfur leaves the process in the principle product of the kiln system called clinker.

The kiln is the only BART source which emits SO_2, thus an SO_2 BART evaluation was performed only for the kiln. The maximum actual 24-hour kiln SO_2 emission rate that was modeled for the BART applicability determination is summarized in Table 4-1.

TABLE 4-1. EXISTING ACTUAL MAXIMUM 24-HOUR SO_2 EMISSION RATES

	SO_2 24-Hour Emission Rate ton/24-hr	SO_2 Hourly Equivalent Emission Rate lb/hr
Kiln	58.67	4889.38

4.1 IDENTIFICATION OF AVAILABLE RETROFIT SO_2 CONTROL TECHNOLOGIES

Step 1 of the BART determination is the identification of all available retrofit SO_2 control technologies. A list of control technologies was obtained by reviewing the U.S. EPA's Clean Air Technology Center, publicly-available air permits, applications, and technical literature published by the U.S. EPA, state agencies, and Regional Planning Organizations (RPOs).

The available retrofit SO_2 control technologies are summarized in Table 4-2.

TABLE 4-2. AVAILABLE SO_2 CONTROL TECHNOLOGIES

SO_2 Control Technologies
Fuel Substitution
Raw Material Substitution
Dry Lime Injection/Scrubbing
Wet Lime Scrubbing

[4] Miller, F. MacGregor and Hawkins, Garth J., "Formation and Emission of Sulfur Dioxide from the Portland Cement Industry", *Proceedings of the Air and Waste Management Association*, June 18-22, 2000.

4.2 ELIMINATE TECHNICALLY INFEASIBLE SO_2 CONTROL TECHNOLOGIES

Step 2 of the BART determination is to eliminate technically infeasible SO_2 control technologies that were identified in Step 1.

4.2.1 FUEL SUBSTITUTION

Holcim uses a mixture of coal, petroleum coke, alternative fuels (synfuel), and oil as the primary fuels for the kiln. For example, the 2007 actual fuel usage breakdown on an energy input basis, was 3.4 percent coal, 84 percent petroleum coke, 11.8 percent synfuel, and 0.8 percent oil (the fuel usages are also on an as received basis). The sulfur content of the petroleum coke is approximately 5.72 percent and the sulfur content of the coal is approximately 3.45 percent. Oil is typically used during preheat of the kiln after a maintenance outage. Coal is also typically used during the kiln startup after an extended shutdown. Coal offers better flame control and appropriate heat distribution during heatup and ramp up of production. The main source of solid fuel for the kiln is petroleum coke.

The design of the long wet kiln system is such that some of the SO_2 resulting from fuel combustion may be emitted and the rest is absorbed in clinker or CKD. Therefore, if Holcim reduces sulfur in the fuel input to the kiln, a corresponding reduction in SO_2 emissions from the kiln would be expected. Holcim contacted fuel suppliers and found a low sulfur Colorado (CO) coal, 0.7 % sulfur, and a regionally available 3.0% sulfur coal that could be used in lieu of the current coal/coke, which would result in a lower overall fuel sulfur content. A number of coal sources were rejected for high chlorine content. For example, a 1.0 percent sulfur source was found but the chlorine content was 1.3 percent (the mine has recently shut down as well), another mine had coal with sulfur in the 1.0 percent and 2.5 percent range, but with chlorine contents in the 0.3 percent range. Further, a 2.8 percent sulfur coal was identified, but it also had too high of a chlorine content, 0.12 percent, to be usable. The 3.0 percent sulfur coal is reported as having a chlorine content of 0.05 percent which is preferable (Note that the 2007 average chlorine content in the coke was 0.08 percent. A summary of the coal composition data obtained is provided in Appendix A. In addition, the plant is subject to chlorine input limitations from HWCMACT. Chlorine contents higher than current levels would very likely cause visible plumes/opacity issues as further described in Appendix B.

Powder River Basin (PRB) coal, which can have a sulfur content in the range of 0.35 percent, was not considered a feasible alternative fuel due to a number of issues. These include difficult physical characteristics, a higher cost of transportation verses the CO coal, the lower heat content relative to the CO coal, and others. The high moisture content and short auto-ignition time lead to an increased risk of spontaneous combustion relative to other coal sources that is further exacerbated by the fact that the PRB coal would need to be delivered via barge. The use of PRB coal could also require the replacement of current coal handling equipment to meet the Class II Division 2, Group F, National Electrical Code (NEC). Further , the lower energy content of PRB coal would require increased volumetric throughput verses the CO coal. Table 4-3 provides a summary of the characteristics of PRB coal verses regular bituminous coal.

TABLE 4-3. CHARACTERISTICS OF PRB COAL VS. REGULAR BITUMINOUS COAL

	PRB Coal	Bituminous Coal
Moisture	20 – 30%	6 – 12%
Ash	4 - 6%	6 – 18%
Volatiles	30 – 32%	33 – 43%
Fixed Carbon	34 – 38%	45 – 60%
LHV (Btu/lb)	8,000 – 9,000	11,000 – 14,000
Explosibility Index	208 bar.m/s	< 180 bar.m/s
Maximum pressure developed during an explosion	115 psi	< 100 psi
Minimum explosive concentration	20 g/m³	60 g/m³
Auto-Ignition times	15-30 days	90 – 120 days

Determining the specific reduction in SO_2 emissions from a reduction in fuel sulfur is complicated as the reactions in the kiln system are complex. The sulfur is introduced into the system in the fuel as well as the raw materials (pyrites) and the sulfur exits the kiln system in the product (clinker), the cement kiln dust (CKD), and out the stack as SO_2. Further, although the sulfur in the clinker is small on a percentage basis, the magnitude of the clinker production is extremely large (greater than 1 million tons per year). Consequently, small changes in the amount of sulfur absorbed in the product can dramatically change the amount of SO_2 emitted. The variation in sulfur in the raw materials from the quarry, the clinker quality requirement determined by the market, and the kiln conditions can all cause significant changes in kiln operating parameters, such as kiln burning temperature, kiln excess Oxygen, etc. These changes can have a strong impact on the sulfur absorbed in the clinker and CKD and hence on SO_2 emissions. These operating conditions can also strongly change how the fuel sulfur affects SO_2 emissions. Reviewing the data yields that there is no linear correlation between fuel sulfur and SO_2 emissions. Although these parameters were continuously monitored and controlled, to calculate an SO_2 control effectiveness, based on switching to a lower sulfur fuel, a high number of assumptions must be made with a very low confidence in the accuracy. Regardless, an attempt has been made.

The assumptions, based on long term averages in 2007, which can vary significantly on an annual and short term (24-hr) basis, include that 65 percent of sulfur input in the kiln system is from fuel, 35 percent of sulfur input is from raw materials, and approximately 30-35 percent of total sulfur input is estimated to ultimately be emitted as SO_2 in the stack.

<u>Low Sulfur CO Coal – 0.7 percent sulfur</u>
Based on the 2007 data, if all of the current coal and coke is replaced with a 0.7 percent low sulfur coal, the sulfur input from fuel is calculated to be reduced by approximately 85 percent (Synfuel levels were held constant and tires were not included as they have a

higher sulfur content than the Low Sulfur CO coal) . Following is a summary of the sulfur input reduction from the use of low sulfur coal. The low sulfur CO coal has a lower heat content (26 Gj/Metric ton) and higher moisture content than the coke currently being used (33 Gj/Metric ton), so a higher volume of low sulfur CO coal is needed than coke reduced.

<u>Current – 2007 Average from coal/coke</u>

Coke Usage:	160,915 metric tons
Low Heat Content	32.510 Gj/Mt
Sulfur Content:	5.72 %
Sulfur Input from Coke:	9,204 metric tons
Current Coal Usage:	9,432 metric tons
Low Heat Content	22.177 Gj/Mt
Sulfur Content:	3.45 %
Sulfur Input from Coal:	325 metric tons

Total Sulfur Input from Coke/Coal: 9,529 metric tons

<u>Low Sulfur CO Coal Replacement</u>

Coal Usage:	208,546 metric tons
Heat Content	26.266 Gj/Mt
Sulfur Content:	0.7 %

Total Sulfur Input from Coal: 1,459 metric tons

<u>Net reduction in sulfur input from coal:</u>

9,529 metric tons – 1,459 metric tons = 8,070 metric tons = 8,893 tons

The SO_2 reduction calculation, based on the calculated sulfur reduction, is very complicated. The pyrite sulfur from the raw materials can volatilize at relatively low temperatures in the kiln, in an area where the sulfur comes in contact with the kiln feed that has only minimally been calcined into CaO. Consequently, less of this sulfur reacts with the CaO and thus is emitted. Again, if the sulfur reacted with the CaO, it would be absorbed into the clinker and CKD. The fuel sulfur, on the other hand, enters the kiln in the burning zone and travels the entire length of the kiln, coming in contact with much higher concentrations of CaO, thus having a much greater chance of being absorbed. Consequently, there is no simple linear relationship between fuel sulfur and SO_2 emissions that can be used to confidently calculate an SO_2 reduction.

The fuel sulfur reduction of 8,893 tons corresponds with a 54 percent reduction of the total sulfur (fuel and raw material sulfur) input to the kiln system in 2007. As mentioned above, a large fraction of fuel sulfur would have been absorbed by the CaO in the system, and thus would not have been emitted as SO_2, while SO_2 emitted from the pyrite in the raw materials has less of a chance of being absorbed, so there is not a directly proportional reduction in SO_2 with the sulfur reduction from the fuels, nor with the total sulfur reduction. Holcim estimates that based on the year 2007 data, the actual SO_2 reduction is about 40% - 50%.

Regional Coal – 3.0 percent.

A scenario that includes replacing the current coal/coke with a 3.0 percent coal was also evaluated. In this scenario, a revised fuel mix is used that includes:

1) replacing the current coal and coke usage making up approximately 87.5 percent of the fuel mix with a 3.0 percent sulfur coal at 72 percent of the fuel mix,
2) increasing Synfuel from approximately 12 percent to 18 percent of the fuel mix, and
3) using tires at approximately 12 percent of the fuel mix (as discussed in MKF section).

The details of the scenario are as follows:

Current – 2007 Average from coal/coke

Coke Usage:	160,915 metric tons
Low Heat Content	32.510 Gj/Mt
Sulfur Content:	5.72 %
Sulfur Input from Coke:	9,204 metric tons
Current Coal Usage:	9,432 metric tons
Low Heat Content	22.177 Gj/Mt
Sulfur Content:	3.45 %
Sulfur Input from Coal:	325 metric tons

Total Sulfur Input from Coke/Coal: 9,529 metric tons

Regional 3.0 Percent Sulfur Coal Scenario – Fuel Mix Changes

3.0 % Coal Usage:	169,241 metric tons
Low Heat Content	25.8 Gj/Mt
Sulfur Content:	3.0 %
Sulfur Input from Coal:	5,077 metric tons
Synfuel Usage (Increase):	4,520 metric tons
Low Heat Content	20.2 Gj/Mt
Sulfur Content:	0.21 %
Sulfur Input from Synfuel:	10 metric tons
Tires:	25,500 metric tons
Low Heat Content	28.0 Gj/Mt
Sulfur Content:	1.83 %
Sulfur Input from Tires:	467 metric tons

Total Sulfur Input from 3.0 percent Coal Scenario: 5,554 metric tons

Net reduction in sulfur input from 3.0 percent coal scenario:

9,529 metric tons – 5,554 metric tons = 3,966 metric tons = 4,372 tons

The result is a net reduction of approximately 42 percent in the sulfur input from the fuel mix which corresponds to an overall sulfur input reduction of approximately 28 percent.

Holcim estimates that the actual SO_2 reduction from this fuel switch would be approximately 20-25 percent.

These reductions are the maximum reductions in tons of SO_2 that can be expected. As mentioned previously, the actual reduction will vary significantly, especially on a short term basis. Holcim estimates that the net reduction in SO_2 for 3.0 percent sulfur coal scenario would be 20-25 percent and for low sulfur CO coal would be in the range of 40 percent to 50 percent.

Holcim considers this technology to be technically feasible and will consider it further.

4.2.2 RAW MATERIAL SUBSTITUTION / SELECTIVE MINING

In a long wet kiln, not only the pyritic sulfur, but total sulfur in the raw materials will have an impact on SO_2 emissions.

Part of the pyritic sulfur reacts with oxygen and forms SO_2 at the relatively lower temperature zone of the kiln. The rest of the sulfur, such as sulfates and sulfur compounds, enters the kiln at higher temperature zones, where more SO_2 is volatized. Some of this SO_2 will pass the length of the kiln without being absorbed and will thus be emitted to the stack.

Using raw materials with lower sulfur content can reduce the potential for SO_2 emissions from a wet kiln system. The limestone, shale, and other raw materials used at the Clarksville plant contain pyrites and total sulfur in varying concentrations. If zones or layers in the on-site quarry could be identified and mined selectively such that lower sulfur content materials are used, the emission rate of SO_2 could theoretically be reduced.

The Clarksville Quarry Scheduling Optimization (QSO) Model was created specifically for predicting relevant mineralogical parameters related to clinker production. Major oxides (Ca, Mg, Si, and Fe) are the primary focus of this predictive model. The sampling protocol and data analysis required for major oxide components was never intended to be adequate for the accurate prediction of minor components, such as sulfur and sulfur compounds (See Appendix C for additional discussions on selective mining limitations based on Holcim's QSO (Quarry Scheduling Optimization) computer model).

Based on the lack of available data to predict if selective mining would be feasible, Holcim has concluded that selective mining is not considered a technically feasible SO_2 control technology for the kiln.

4.2.3 DRY LIME INJECTION/DRY LIME SCRUBBING

Dry Lime Injection, or Dry Lime Scrubbing (DLS), consists of injecting hydrated lime, $Ca(OH)_2$, into the flue gas. The $Ca(OH)_2$ reacts with SO_2 in the flue gas stream to create fine particles of $CaSO_3$ or $CaSO_4$. The particles are collected in the particulate matter control device (PMCD) serving the kiln.

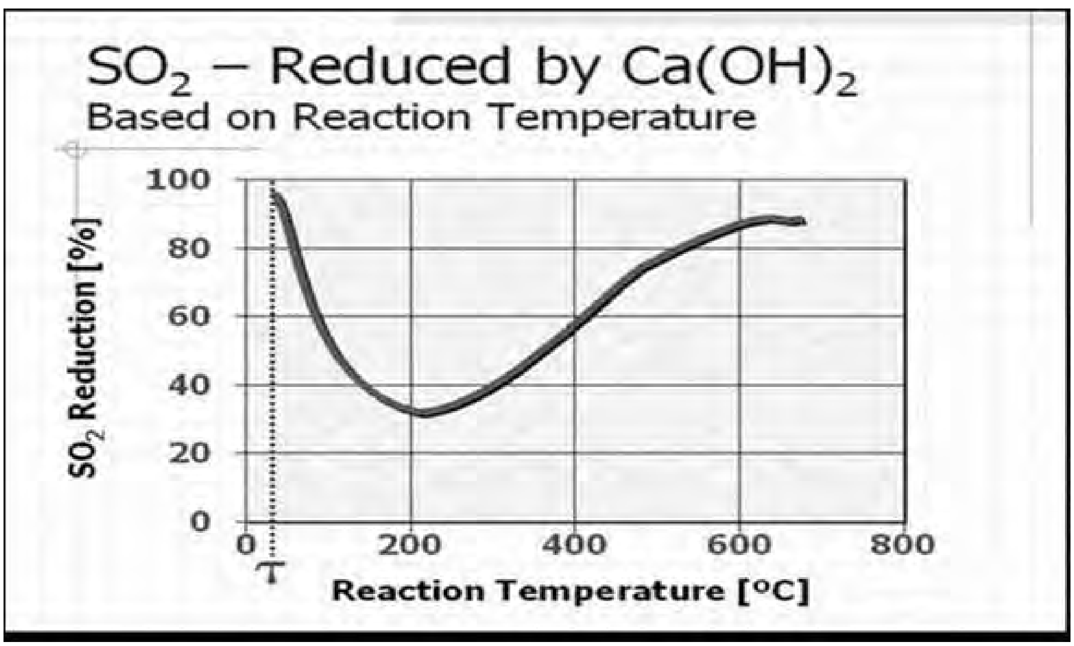
The current PMCD was not sized/designed to handle the additional particulate matter loading that would result from this technology. Consequently, adding DLS could cause

PM emissions and opacity to increase above permitted levels requiring Holcim to replace the existing PMCD (an ESP) with a new PMCD (a Baghouse).

Holcim is aware of only one other long term application of this technology on a wet kiln, which is on a smaller wet kiln in Belgium. Consequently, very little data exists to directly quantify the feasibility or benefit (emission reduction) of such a system. Regardless, Holcim is considering the technology to be technically feasible.

The effectiveness of DLS is impacted by both the temperature and the residence time/air flow rate at the location it is injected. At Clarksville, the injection point would be between the kiln outlet and the PMCD. At this location, the temperature is approximately 200 deg C (415 deg F). The temperature can not be increased at this location as the plant has limitations on the inlet temperature to the PMCD from both the Portland Cement MACT and the Hazardous Waste Combustion MACT in order to meet the Dioxin/Furan (D/F) limit. Further, lowering the temperature would lead to lower ESP efficiency and opacity problems. Figure 4-1 is a plot of SO_2 reduction versus reaction temperature from a commonly used article entitled “What is Achievable with Today’s Technologies”, Mark S. Terry, Krupp Polysius Corp, 2001. As indicated in the figure, at a temperature of 200 deg C (415 deg F), the reduction level is approximately 30 percent, which is the lowest reduction level over the temperature range presented.

FIGURE 4-1. SO_2 REDUCTION VERSUS REACTION TEMPERATURE FOR HYDRATED LIME



The molar ratio of lime (calcium source) to SO_2 is much higher than in a typical coal fired boiler due to a number of factors, some of which include the higher CO_2 and dust levels in the cement kiln system exhaust. The CO_2 competes with SO_2,in the reaction with the lime, and the higher dust loading reduces the even distribution of the lime in the gas. Based on a communication with the Obourg plant in Belgium, a molar ratio of between 4:1 and 6:1

has been used. The larger size of the Clarksville kiln will make it more difficult to evenly distribute the lime to the kiln gas and thus Holcim anticipates that a molar ratio of 6:1 will be required to achieve a maximum control efficiency of 20 - 30 percent.

Holcim considers this technology to be technically feasible and will consider it further.

4.2.4 WET LIME SCRUBBING

Wet lime scrubbing (WLS) is a name for a traditional tailpipe wet scrubber. This process involves passing the flue gas from the main PMCD through a sprayed aqueous suspension of $Ca(OH)_2$ or $CaCO_3$ (limestone) that is contained in an appropriate scrubbing device. In the case of the Clarksville plant, the basic underlying economics would dictate the use of ground limestone as the scrubbing reagent. Use of the cement kiln dust as a scrubbing reagent was not considered as a viable option for Clarksville due to its high chlorine content and a large amount of inerts. In WLS, the aqueous suspension of scrubbing reagent is not taken to dryness as it is in DLS. The SO_2 reacts with the scrubbing reagent to form $CaSO_3.H_20$ or gypsum that is collected and retained as aqueous sludge. The sludge is either dewatered and disposed of or used as synthetic gypsum.

The scrubbing efficiency of WLS can vary from an estimated 80 percent to 95 percent of the SO_2 in the flue gas treated by the scrubber[5]. Further, WLS is a high maintenance process with high rates of downtime expected from build up or plug up of mist-eliminators or spray nozzles and the severe wear and corrosion of components. Holcim has found that high levels of hydrocarbons (THC) in the gas stream have caused significant corrosivity and foam build-up at their Dundee plant. Further, it significantly influences the system availability and the efficiency. The THC levels at the Clarksville plant may also lead to build up and plugging, and thus an availability (uptime) of the WLS of 95 percent is assumed.

Despite these identified drawbacks, WLS is considered a technically feasible BART option.

4.3 RANK OF TECHNICALLY FEASIBLE SO_2 CONTROL OPTIONS BY EFFECTIVENESS

The third step in the BART analysis is to rank the technically feasible options according to effectiveness. Table 4-4 provides the effectiveness of each technology in the form of an annual average efficiency.

[5] Assessment of Control Technology Options for BART-Eligible Sources Steam Electric Boilers, Industrial Boilers, Cement Plants and Paper and Pulp Facilities. Prepared by Northeast States for Coordinated Air Use Management In Partnership with The Mid-Atlantic/Northeast Visibility Union, March 2005, Page 4-21, Table IV-4. Range of Removal Efficiencies of Wet SO2 Scrubbers for Long Wet Kilns.

TABLE 4-4. RANKING OF TECHNICALLY FEASIBLE KILN SO_2 CONTROL TECHNOLOGIES BY EFFECTIVENESS

Control Technology	Effectiveness SO_2 Reduction (Percent Reduction – Annual Basis)
Wet Lime Scrubbing	80-95%
Fuel Substitution	20-50%
Dry Lime Scrubbing	20-30%

4.4 EVALUATION OF IMPACTS FOR FEASIBLE SO_2 CONTROLS

Step four of the BART analysis procedure is the impact analysis. The BART determination guidelines list the four factors to be considered in the impact analysis:

- Cost of compliance
- Energy impacts
- Non-air quality impacts; and
- The remaining useful life of the source

Holcim has conducted an impact analysis for the remaining SO_2 control options.

4.4.1 WET LIME SCRUBBING

Cost of Compliance

Holcim utilized a recent WLS vendor bid, scaled to 2012 dollars[6], as the basis for the economic analysis to determine the annualized cost for WLS. Holcim divided the annualized cost of WLS by the annual tons of SO_2 reduced to determine the cost effectiveness for WLS. The "annual tons reduced" were determined by subtracting the estimated controlled annual emissions from the existing annual emissions. The existing annual emissions should be considered both on a projected actual and a potential to emit (PTE) basis. The projected actual (PA) annual SO_2 emissions provided to the MDNR in the recent Mid Kiln Firing (MKF) permit application was 11,481 tons/year[7]. The PTE listed in the MKF permit is 13,298 tons/year. The estimated controlled annual emissions were calculated by applying an 80 percent to 95 percent control efficiency and a 95 percent control device uptime, to the projected actual annual and PTE emissions. Table 4-5 provides a summary of the cost effectiveness analysis related to WLS. The detailed cost analysis table is provided in Appendix D.

6 The most recent U.S. Department of Labor, Producer Price Index Industry Data, from April 2004 – April 2008 indicates that costs have increased by the ratio of 143.2/102.9 over the last 5 year period (or 8.06 points per year). The original bid was from 2005. Consequently, the equipment cost was scaled up to 2012 (8 years) by multiplying by the following percentage (100 + (8 x 8.06)) percent = 1.645.

7 The projected actual annual emission rate was determined as part of the construction permit application process to support the August 27, 2007 Mid Kiln Firing construction permit. Permit Number 082007-019.

The equipment cost includes both the WLS system and a limestone preparation system. The limestone preparation system includes 2 Ball Mills used to grind the limestone received to a specific fineness.

The cost effectiveness analysis does not include the cost to construct a new exhaust stack, which may be needed to employ the WLS technology, and it does not include the possible additional cost for the equipment relocation on site due to the limited space available for the WLS system.

The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

Two factors that significantly increase the cost of this technology are the need to reheat the exhaust gas and the cost of sludge disposal.

Exhaust Gas Reheat

A common concern of utilizing a wet scrubber on a cement kiln exhaust gas is the probable formation of a detached plume resulting in opacity violations. For a typical cement kiln stack, if the exhaust gas contains NH_3, HCl, and SO_2, sub-micron aerosols of NH_4Cl and $(NH_4)2SO_4$ may form when the gas temperature is reduced after exiting the stack. A detached plume is predicted to occur when the exhaust gas is cooled to the dew point at or near the exit of the stack and prior to the dilution of the aerosol forming constituents. The wet scrubber requires the exhaust gas to be cooled to the dew point at the inlet of the scrubber. As the temperature of the exhaust gas is cooled in the scrubber, a visible plume condition is nearly assured. The sub-micron NH_4Cl aerosol will be formed and is difficult to remove in the scrubber. This problem has been reported for wet scrubbers used at cement plants. As the plant is subject to a 20 percent opacity limitation from both the PCMACT and HWCMACT, even a small increase in opacity could lead to an exceedance of the standard, which is not acceptable. Based on information from Holcim's Dundee, Michigan plant, Holcim anticipates that the temperature of the exhaust gas at the exit of the scrubber would be approximately 170 deg F. To keep the sub-micron particles from forming at the exit of the stack, reheating the exhaust gas, after the scrubber, is required. A thorough evaluation of the stack gas constituents was conducted by Holcim and it was determined that to prevent an unacceptable increase in opacity from occurring, the stack gas would need to be reheated (if a scrubber is installed) to at least the current gas temperature after the ESP of approximately 380 deg F (see Appendix B for the detailed analysis). This re-heating would most likely be achieved using natural gas combustion. The natural gas combustion would lead to a 97 ton/year increase in NO_x emissions that would negatively impact visibility gains from the SO_2 reduction.

Sludge Disposal

The sludge generated from the WLS system may require disposal. Therefore, Holcim has determined the cost of disposal based on a bid from Area Disposal Services, Inc. for the disposal fee ($36/ton), as well as the cost for trailer rental ($120/month) and transportation ($220/load). In addition, Holcim also looked at the corresponding cost of building an onsite landfill for disposal, but based on information provided by MDNR, the time and

resources required to obtain a permit, and the additional liability associated with an onsite landfill, Holcim decided not to pursue that option.

WLS may also lead to an increase in PM emissions because some particles of limestone or $CaSO_3$ will be entrained in the flue gas and subsequently be emitted from the scrubber. WLS is also known to increase emissions of sulfuric acid mist.[8]

TABLE 4-5. COST ANALYSIS SUMMARY FOR WET LIME SCRUBBING

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant* Removed (tons/yr)	Cost** Effectiveness ($/ton)	Cost*** Impact ($/ton clinker)
WLS – PA	80%	$24,385,436	11,481	8,726	$2,826	$20
WLS – PA	95%	$24,925,003	11,481	10,362	$2,428	$21
WLS – PTE	80%	$24,840,863	13,298	10,106	$2,482	$20
WLS – PTE	95%	$25,465,823	13,298	12,001	$2,139	$21

*Assumes 95% uptime.
**Includes 97 tons of NOx generated.
***Based on a maximum historical actual clinker production rate of 1,215,708 tons/year.

The significant increases in cost per ton of clinker produced from using WLS, as shown in Table 4-5, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with WLS.

Energy Impacts
A wet scrubber requires an additional fan of considerable horsepower to move the flue gas through the scrubber. The exhaust gas reheat requirement will utilize approximately 1,000,000 MMcf/year of natural gas, which will itself lead to an increase in NOx emissions of 97 tons/yr.

Non Air-Quality Impacts
Without reheating, a frequent steam plume and/or detached plume can be expected at the discharge of the wet scrubber that would result in visual impairment in the area.

The WLS technology could generate over 50,000 tons per year of waste (sludge) that will require disposal in a landfill.

Remaining Useful Life
The remaining useful life of the kiln does not impact the annualized cost of WLS because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.4.2 FUEL SUBSTITUTION

Cost of Compliance

Low sulfur CO coal

The increased cost of using low sulfur CO coal (0.7 percent sulfur) includes the relative increase in fuel cost as well as the cost of a new coal mill system. Low sulfur CO coal is harder than the current coal/coke utilized and has a lower heat content; consequently, a higher volume of coal grinding will be needed than the current mill can achieve. The increased grinding requirement would also have an additional energy requirement. A bid for a new coal mill, classifier, and mill motors, was obtained from GEBR. Pfeiffer USA Inc. and was scaled to 2012 dollars[9],

Regional 3.0 percent sulfur coal

The increased cost of the regional 3.0 percent sulfur coal scenario includes the relative increase in fuel cost as well as the cost of a new primary air fan and associated equipment. The 3.0 percent sulfur coal has a lower heat content than coke; consequently, a higher volume of coal will be needed that will require a larger primary air fan. Holcim is proposing to change the coal mill primary air fan and associated equipment. Reducing the capital cost does not have a significant impact on the outcome of the cost analysis. That is, eliminating the capitol cost completely only reduces the cost from $1,286/ton SO2 to $1,039/ton SO_2. Consequently, Holcim has chosen to not spend additional time and effort documenting these costs.

Table 4-6 provides a summary of the cost effectiveness analysis related to Fuel Substitution. The detailed cost analysis table is provided in Appendix D.

The cost effectiveness analysis does not include the cost to construct any new storage or handling facilities for the low sulfur CO coal that may be required.

The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

[9] The most recent U.S. Department of Labor, Producer Price Index Industry Data, from April 2004 – April 2008 indicates that costs have increased by the ratio of 143.2/102.9 over the last 5 year period (or 8.06 points per year). The original bid was from 2007. Consequently, the equipment cost was scaled up to 2012 (5 years) by multiplying by the ratio of 143.2/102.9.

TABLE 4-6. COST ANALYSIS SUMMARY FOR FUEL SUBSTITUTION

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)	Cost* Impact ($/ton clinker)
Fuel Sub – PA	23%	$3,933,016	11,481	2,641	$1,489	$3
Fuel Sub – PA	40%	$27,218,156	11,481	4,592	$5,927	$22
Fuel Sub – PA	50%	$27,218,156	11,481	5,741	$4,741	$22
Fuel Sub – PTE	23%	$3,933,016	13,298	3,059	$1,286	$3
Fuel Sub – PTE	40%	$27,218,156	13,298	5,319	$5,117	$22
Fuel Sub – PTE	50%	$27,218,156	13,298	6,649	$4,094	$22

*Based on a maximum historical actual clinker production rate of 1,215,708 tons/year

The 3.0 percent sulfur coal option (used 23 percent control as the average) is cost effective and will be considered further.

The low sulfur CO coal option (40 to 50 percent control) is not cost effective and results in significant increases in cost per ton of clinker produced that would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with the low sulfur CO coal scenario.

In addition, for this analysis Holcim did consider the blending of solid fuel but considered it also to not be cost effective. In order to properly blend solid fuels for a precise distribution to control sulfur and chlorine inputs and not disrupt production due to fuel quality swings, an additional solid fuel equipment handling system would have to be installed. At a minimum, for each additional solid fuel used a system consisting of feed chutes, transfer conveyors, a storage silo, and a weigh belt would be required. It was conservatively estimated that the cost would be similar to the cost of a new mill and thus increase the cost well above the 3.0% sulfur coal option.

Energy Impacts

The low sulfur CO coal will require additional energy for grinding. The actual increase is difficult to estimate. The regional coal option also relies that a reliable source of tire derived fuel (TDF) and Hazardous Waste Derived Fuel (HWDF) is available to supplement 23% of the thermal requirements for clinker production

Non Air-Quality Impacts

None.

Remaining Useful Life

The remaining useful life of the kiln does not impact the annualized cost because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.4.3 DRY LIME SCRUBBING

Cost of Compliance

The increased cost of DLS includes the cost of hydrated lime as well as the injection system and replacing the existing ESP with a new baghouse. As the DLS injection system would likely be a custom application, Holcim's engineering department has estimated that the DLS injection system equipment cost would be approximately $1,000,000. Holcim obtained a bid for retrofitting the existing ESP with a Baghouse from GE Energy. A detailed analysis has not yet been completed to determine if the retrofit will be capable of handling the additional dust loading from the DLS system.

The quantity of hydrated lime required is calculated below on a PA and PTE basis as follows:

<u>Hydrated Lime Requirement.</u>

PA Basis:

The projected actual annual emission level of SO_2 is 11,481 tons

A molar ratio of 6:1, $Ca(OH)_2$ to SO_2, is required. The $Ca(OH)_2$ required is calculated by multiplying by the ratio of molecular weights:

6 x 11,481 tons SO_2 x (74 ton $Ca(OH)_2$/ 64 SO_2) = 79,649 tons $Ca(OH)_2$

The estimated purity of the hydrated lime is 96.8 percent $Ca(OH)_2$. Consequently, the amount required is scaled as follows:

79,649 tons $Ca(OH)_2$ / 0.968 = 82,282 tons hydrated lime

PTE Basis:

The PTE annual emission level of SO_2 is 13,298 tons

A molar ratio of 6:1, $Ca(OH)_2$ to SO_2, is required. The $Ca(OH)_2$ required is calculated by multiplying by the ratio of molecular weights:

6 x 13,298 tons SO_2 x (74 ton $Ca(OH)_2$/ 64 SO_2) = 92,255 tons $Ca(OH)_2$

The estimated purity of the hydrated lime is 96.8 percent $Ca(OH)_2$. Consequently, the amount required is scaled as follows:

92,255 tons $Ca(OH)_2$ / 0.968 = 95,304 tons hydrated lime

Table 4-7 provides a summary of the cost effectiveness analysis related to DLS. The detailed cost analysis table is provided in Appendix D. The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

TABLE 4-7. COST ANALYSIS SUMMARY FOR DRY LIME SCRUBBING

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)	Cost* Impact ($/ton clinker)
DLS – PA	20%	$14,725,124	11,481	2,181	$6,750	$12
DLS – PA	30%	$14,725,124	11,481	3,272	$4,500	$12
DLS – PTE	20%	$16,756,579	13,298	2,527	$6,632	$14
DLS – PTE	30%	$16,756,579	13,298	3,790	$4,421	$14

*Based on a maximum historical actual clinker production rate of 1,215,708 tons/year

The significant increases in cost per ton of clinker produced from using DLS, as shown in Table 4-7, would likely eliminate any profit margin currently realized by the plant. Thus, it would not be economically feasible to operate the plant with DLS.

Energy Impacts
Additional electricity is needed for the pump used to inject the lime into the kiln gas.

Non Air-Quality Impacts
Utilizing DLS could also increase the amount of CKD sent to the landfill.

Remaining Useful Life
The remaining useful life of the kiln does not impact the annualized cost because the useful life is anticipated to be at least as long as the capital cost recovery period, which is 15 years.

4.5 EVALUATION OF VISIBILITY IMPACT OF FEASIBLE SO_2 CONTROLS

A final impact analysis was conducted to assess the visibility improvement for the existing emission rate when compared to the emission rate of WLS, Fuel Substitution, and DLS. The existing emission rates, and emission rates associated with controls, were modeled using CALPUFF. The existing emission rate is the same rate that was modeled for the BART applicability analysis. The SO_2 emission rate associated with WLS, Fuel Substitution, and DLS is the existing emission rates less the average anticipated control of 87.5 percent, 45 percent and 23 percent, and 25 percent respectively. The emission rates are summarized in Table 4-8.

TABLE 4-8. SUMMARY OF EMISSION RATES MODELED IN SO_2 CONTROL VISIBILITY IMPACT ANALYSIS

Emission Rate Scenario	Emission Rate		
	SO_2 (lb/hr)	NO_X (lb/hr)	PM_{10} (lb/hr)
WLS – 87.5%	611	3,049	51.82
Fuel Substitution – 45%	2,689	3,049	51.82
Fuel Substitution – 23%	3,765	3,049	51.82
DLS – 25%	3,667	3,049	51.82
Base case – Max 24-hr avg.	4,889	3,049	51.82

Comparisons of the existing visibility impacts and the visibility impacts based on WLS, Fuel Substitution, and DLS are provided in Table 4-9. The visibility improvement associated with the controls are also shown in Table 4-9; this value was calculated as the difference between the existing visibility impairment and the visibility impairment for the controlled emission rates as measured by the 98th percentile modeled visibility impact.

TABLE 4-9. SUMMARY OF MODELED IMPACTS FROM SO_2 CONTROL VISIBILITY IMPACT ANALYSIS

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61

DLS Improvement 98% Impact (Δdv)	0.14	0.11	0.13

4.6 PROPOSED BART FOR SO_2

Holcim reviewed each control option's availability, as well as its cost of compliance, energy impacts, and non-air quality impacts, as well as the remaining useful life of the kiln. Table 4-10 summarizes the cost effectiveness for the controls based on the tons of SO_2 reduced and the visibility improvement in deciviews.

TABLE 4-10. SUMMARY OF COST EFFECTIVENESS OF SO_2 CONTROL OPTIONS

Control Option*	Existing Emissions (tons/yr)	Reduced Annual Emissions (tons/yr)	Annual Cost ($/yr)	Cost** Effectiveness ($/ton)	Cost Impact ($/ton clinker)
WLS–PA–80%	11,481	8,726	$24,385,436	$2,826	$20
Fuel Sub–PA-40%	11,481	4,592	$27,218,156	$5,927	$22
Fuel Sub–PA–23%	11,481	2,641	$3,933,016	$1,489	$3
DLS – PA - 20%	11,481	2,181	$14,725,124	$6,750	$12

*The worst case scenario from a cost effectiveness perspective is provided.

**Includes 97 tons of NOx generated for WLS

Buffalo	0.61	0.48	0.13	21.3	$113,270,187

Based on the five step analysis outlined by EPA, this analysis demonstrates that the cost of compliance associated with WLS, Fuel Substitution with low sulfur CO coal, and DLS is extremely high on a $/ton of SO_2 removed basis, and especially on a $/DV of improvement basis, and is not economically feasible, especially if the cost per ton of clinker produced is taken into account. Fuel Substitution with a regional 3.0 percent sulfur coal, resulting in a 23 percent reduction in SO_2 emissions, is economically feasible and is being proposed as BART.

Holcim proposes that BART for SO_2 for the Holcim Clarksville Kiln is fuel substitution or equivalent technologies that will achieve a 23 percent reduction in the maximum daily SO_2 emission rate of 117,345 lbs.

Consistent with BART applicability which is determined on a daily basis, Holcim proposes to comply with an enforceable limit for SO_2 of 90,356 lbs/day which is a 23% reduction in the maximum daily SO_2 emission rate of 117,345 lbs.

In Portland cement kilns, the NO_X that is generated is primarily classified into one of two categories, i.e., thermal NO_X or fuel NO_X[10]. Thermal NO_X occurs as a result of the high-temperature oxidation of molecular nitrogen present in the combustion air. Fuel NO_X is created by the oxidation of nitrogenous compounds present in the fuel. It is also possible for nitrogenous compounds to be present in the raw material feed and become oxidized to form additional NO_X referred to as feed NO_X.

Due to the high flame temperature in the burning zone of the rotary kiln (3400° F), NO_X emissions from the kiln tend to be mainly comprised of thermal NO_X. Although NO_X emissions from cement kilns include both nitrogen oxide (NO) and nitrogen dioxide (NO_2), typically, less than 10% of the total NO_X in the flue gas is NO_2.[11]

The kiln is the only BART source which emits NO_x, thus a NO_x BART evaluation was performed only for the kiln. The maximum actual 24-hour kiln NO_x emission rate that was modeled for the BART applicability determination is summarized in Table 5-1. The NO_x 24-hour maximum actual emission rate was determined from analyzer data for November 24, 2007.

TABLE 5-1. EXISTING ACTUAL MAXIMUM 24-HOUR NO_X EMISSION RATES

	NO_x 24-Hour Emission Rate ton/24-hr	NO_x Hourly Equivalent Emission Rate lb/hr
Kiln	36.59 (73,185 lbs)	3,049

5.1 IDENTIFICATION OF AVAILABLE RETROFIT NO_X CONTROL TECHNOLOGIES

Step 1 of the BART determination is the identification of all available retrofit NO_X control technologies. A list of control technologies was obtained by reviewing the U.S. EPA's Clean Air Technology Center, control equipment vendor information, publicly-available air permits, applications, and technical literature published by the U.S. EPA and the RPOs.

The available retrofit NO_X control technologies are summarized in Table 5-2.

[10] NO_X Formation and Variability in Portland Cement Kiln Systems, Penta Engineering, December 1998.

[11] IBID.

TABLE 5-2. POSSIBLE NO_X CONTROL TECHNOLOGIES

Kiln Control Technologies
Low NO_X Burner Flue Gas Recirculation CKD Insufflation Mid-Kiln Firing of Tires Selective Noncatalytic Reduction Selective Catalytic Reduction

5.2 ELIMINATE TECHNICALLY INFEASIBLE NO_X CONTROL TECHNOLOGIES

Step 2 of the BART determination is to eliminate technically infeasible NO_X control technologies that were identified in Step 1.

5.2.1 LOW-NO_X BURNER IN THE ROTARY KILN

Low NO_x burners (LNBs) reduce the amount of NO_x formed at the flame. The principle of all LNBs is the same: stepwise or staged combustion and localized exhaust gas recirculation (i.e. at the flame). As applied to the rotary cement kiln, the low-NO_X burner creates primary and secondary combustion zones at the end of the main burner pipe to reduce the amount of NO_x initially formed at the flame. In the high-temperature primary zone, combustion is initiated in a fuel-rich environment in the presence of a less than stoichiometric oxygen concentration. The oxygen-deficient condition at the primary combustion site minimizes thermal and fuel NO_X formation and produces free radicals that chemically reduce some of the NO_X that is being generated in the flame.

In the secondary zone, combustion is completed in an oxygen-rich environment. The temperature in the secondary combustion zone is much lower than in the first; therefore, lower NO_X formation is achieved as combustion is completed. CO that has been generated in the primary combustion zone as an artifact of the sub-stoichiometric combustion is fully oxidized in the secondary combustion zone.

Low-NO_X burners are considered to be a technically feasible option for NO_X control. As Holcim already has a LNB, the technology will not be considered further.

5.2.2 FLUE GAS RECIRCULATION

Flue gas recirculation involves the use of oxygen-deficient flue gas from some point in the process as a substitute for primary air in the main burner pipe in the rotary kiln. Flue gas recirculation (FGR) lowers the peak flame temperature and develops localized reducing conditions in the burning zone through a significant reduction of the oxygen content of the primary combustion "air." The intended effect of the lower flame temperature and reducing conditions in the flame is to decrease both thermal and fuel NO_X formation in the rotary kiln.

While FGR is a practiced control technology in the electric utility industry, Holcim is not aware of any attempt to apply FGR to a cement kiln because of the unique process requirements of the industry, i.e., a hot flame is required to complete the chemical reactions that form clinker minerals from the raw materials. The process of producing clinker in a cement kiln requires the heating of raw materials to about 2700°F for a brief but appropriate time to allow the desired chemical reactions that form the clinker minerals to occur. A short, high-temperature flame of about 3400°F is necessary to meet this process requirement. The long/lazy flame that would be produced by FGR would result in the production of lower or unacceptable quality clinker because of the resulting undesirable mineralogy. Clinkering reactions must take place in an oxidizing atmosphere in the burning zone to generate clinker that can be used to produce acceptable cement. FGR would tend to produce localized or general reducing conditions that also could detrimentally affect clinker quality. Due to these important limitations on the application of FGR and the lack of a successful demonstration on a cement kiln in the United States, FGR is not a technically feasible control option for NO_X control at this time.

5.2.3 CEMENT KILN DUST INSUFFLATION

Cement kiln dust (CKD) is a residual byproduct that can be produced by any of the four basic types of cement kiln systems. CKD is most often treated as a waste even though there are some beneficial uses. However, as a means of recycling usable CKD to the cement pyroprocess, CKD sometimes is injected or insufflated into the burning zone of the rotary kiln in or near the main flame. The presence of these cold solids within or in close proximity to the flame has the effect of cooling the flame and/or the burning zone thereby reducing the formation of thermal NO_X. The insufflation process is somewhat counterintuitive because a basic requirement of a cement kiln is a very hot flame to heat the clinkering raw materials to about 2700^{o}F in as short a time as possible. The Clarksville plant already uses this technology and it is already included in the baseline. Therefore, this option is removed from consideration for BART.

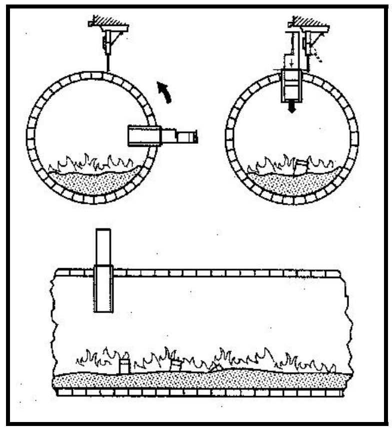
5.2.4 MID-KILN FIRING OF SOLID FUEL WITH MIXING AIR FAN

Secondary combustion is defined as follows: a portion of the fuel is fired in a location other than the burning zone. This reduces thermal NO_x generation because the temperature in the secondary combustion zone is less than 2100 °F. Mid-kiln firing (MKF) of solid fuels is an example of secondary combustion and includes fuels such as used tires, oil filter fluff, plastics, spent activated carbon and carbon black, asphalt shingles, diaper manufacturing waste, and other combustible solids. MKF improves clinker process energy efficiency, allows for greater operational flexibility with respect to fuel types, and is currently listed as a NOx control technology in 10 CSR 10-6.380 Control of NOx Emissions from Portland Cement Kilns.

An example of a MKF system is the Cadence feed form MKF technology which was first introduced in 1989. It is comprised of three primary components: (1) a staging arm or "feed fork," that picks up the fuel modules and positions them for entry into the kiln, (2) two pivoting doors that open to allow the fuel to drop into the kiln, and (3) a drop tube that

extends through the side wall of the kiln. In addition to these basic components, feed fork technology also requires a delivery system which positions the fuel models so they can be picked up by the feed fork and a mechanism for opening the doors so the fuel can enter the kiln. Due to rotation of the kiln, fuel can only be injected once per revolution from the top, as shown in Figure 5-1.

FIGURE 5-1. MID-KILN FIRING SCHEMATIC[12]



High-pressure air, in the range of a 2-10 percent replacement of the primary combustion air, could be injected through the shell of the rotary kiln and into the calcining zone to where a mixing air fan mixes the air with the gas and fuel within the rotary kiln for more complete combustion of the solid fuel.

By adding fuel mid-kiln, MKF changes both the flame temperature and flame length. These changes should reduce thermal NO_X formation by burning part of the fuel at a lower temperature and by creating reducing conditions at the mid-kiln fuel injection point which may destroy some of the NO_X formed upstream in the kiln burning zone.

Clarksville has the largest long kiln in the world. The kiln has a 7 meter diameter and a very high thermal capacity. Using whole tires to replace 10% of total fuel consumption will require four whole tires being fed to the mid-kiln door per kiln revolution, 12% fuel replacement would require 5 tires per revolution. The maximum tire feed rate per revolution that Holcim is aware of, on similar applications, is three tires per revolution. Holcim is concerned that the greater the number of tires fed per revolution, on a continuous basis, the greater the potential for process upsets from unstable feeding. Holcim has found that kilns being fed even one to three tires per revolution can have problems with stable, uniform feeding. In addition, if too many tires burn at the bottom of the kiln, a high local temperature could result which would disturb the normal operation of the kiln and potentially increase NOx. Further, due to the large kiln diameter, the reducing zone created by burning tires may only impact a small cross section of the entire cross section of the kiln, thus having less of an overall reduction in NOx than anticipated.

[12] NO_X Control Technologies for the Cement Industry, EC/R Incorporated, Chapel Hill, NC, USA, U.S. EPA Contract NO. 68-D98-025, U.S. EPA RTP, September 19, 2000.

In an effort to better understand these uncertainties, Holcim hired CINAR Company, the expert in this field, to conduct modeling of the system and to predict NOx reduction. Their study predicted that a 15% NOx reduction would occur at 10% replacement (replace 10% of the current fuel with tires) and 27% NOx reduction for 15% replacement.

To then determine the thermal substitution rate (TSR) of tires that the Clarksville plant is capable of utilizing, three additional factors must be considered:

1. Tire availability. The local market only has sustainable resources of 10-12% TSR;
2. Tire feeding limit: 12% TSR equates to five tires being fed per revolution.
3. The thermal stability of operation in a large kiln. 15% TSR is predicted to be the maximum for short term periods, whereas 10-12% TSR is predicted to be achievable on a long term basis.

Based on the lack of experience using MKF of tires on kilns the size of Clarksville, Holcim is relying on the computer modeling (regardless of the general uncertainty that exists with computer models) to estimate the NOx reduction. Holcim anticipates that MKF of tires may achieve up to 20% percent NOx reduction at a TSR of 12 percent on a long term basis.

Tires also have the benefit of a lower sulfur content (the Rubber Manufacturers Association reports a value of 1.83 percent) relative to the current coal/coke used as accounted for in the Fuel Substitution – Regional 3.0 percent sulfur coal scenario (See Section 4.2.1) for SO_2 control

MKF is considered to be a technically feasible option for NOx control. Further, Holcim has already received a construction permit that would allow the installation of MKF, whereas other technologies would require a new construction permit application process, the result of which is unknown.

5.2.5 SELECTIVE NONCATALYTIC REDUCTION

In the relatively narrow temperature window of 1600 to 1995°F, ammonia (NH_3) reacts with NO_x without the need for a catalyst to form water and molecular nitrogen in accordance with the following simplified reactions.

$4NO + 4NH_3 + O_2 \rightarrow 4N_2 + 6H_2O$
$2NO_2 + 4NH_3 + O_2 \rightarrow 3N_2 + 6H_2O$

As applied to NO_x control from cement kilns and other combustion sources, this technology is called selective noncatalytic reduction (SNCR). Above this temperature range, the NH_3 is oxidized to NO_x thereby increasing NO_x emissions. Below this temperature range, the reaction rate is too slow for completion and unreacted NH_3 may be emitted from the pyroprocess. This temperature window generally is available at some

location within the rotary kiln. The NH_3 could be delivered to the kiln shell through the use of anhydrous NH_3, or an aqueous solution of NH_3 (ammonium hydroxide) or urea.

A concern about application of SNCR technology is the breakthrough of unreacted NH_3 as "ammonia slip" and its subsequent reaction in the atmosphere with SO_2, sulfur trioxide (SO_3), hydrogen chloride (HCl) and/or chlorine (Cl_2) to form a detached plume of sub-micron particles. As NH_3 or Urea injection rates are increased, to attempt to achieve higher levels of reduction, NH_3 emission levels are increased.

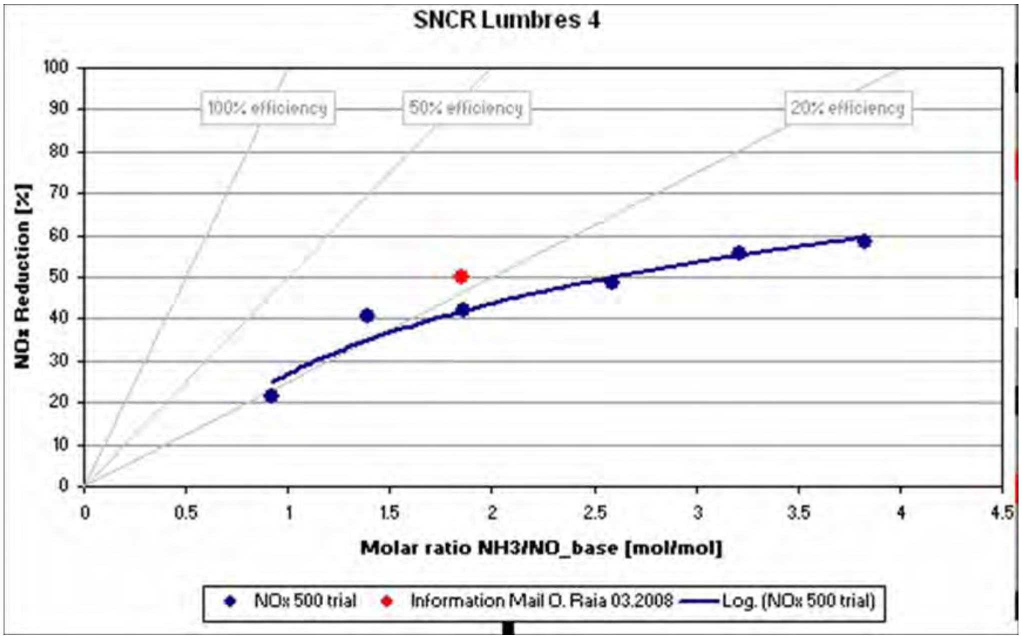
Industry Experience

Ash Grove Cement Company installed a full scale SNCR system on one of its wet kilns in Midlothian, Texas. Ash Grove has reported that it is achieving a 35 to 40% NOx reduction; however, as this application has just started, no data is available to verify this reduction is being achieved or on what averaging period or the long term sustainability.[13]

Holcim's wet plant in Lumbres, France utilizes SNCR. It is the earliest application of SNCR on a long kiln in the world and has been running for multiple years. The plant has found that NH_3 slip increases as the urea injection rate increases especially when the molar ratio is more than 1.0 (i.e. the NH_3 added is more than needed for the reaction). At this level, significant amounts of NH_3 are unreacted. The plant reports achieving 20 percent NOx reduction at a 1.0 molar ratio of NH_3/NOx and 40 percent at a molar ratio of 1.5 as shown in Figure 5-2.

[13] BART Five Factor Analysis. Ash Grove Cement Company Montana City, Montana. Dated June 2007. Page 5-9.

FIGURE 5-2. NOX REDUCTION VERSUS NH3 MOLAR RATIO OBSERVED AT HOLCIM LUMBRES PLANT.



However, at 20 percent NOx reduction, the NH_3 slip is reported to be 10 mg/m3, while at 40 percent reduction, the NH_3 slip can be 20 – 30 mg/m^3 (a 50 percent to 100 percent increase). Based on experiences at many cement plants with SO_2 and HCl in the exhaust gas, which is also the case for the Clarksville plant, a 20 mg/Nm3 NH_3 increase would cause a severe increase in plume visibility. The Lumbres plant is also smaller than Clarksville, having a diameter of only 3.3 meters versus Clarksville's 7 meter diameter kiln. The larger diameter of Clarksville's kiln would make distribution of the reagent across the kiln more difficult, and would reduce the effectiveness to an unknown degree.

NO_X reductions from SNCR systems can vary considerably based on site specific conditions, most notably being the type of kiln. For example, the NO_X reduction at the long wet kiln at Lumber is lower at a given ammonia molar ratio than observed at similar size preheater/pre-calciner (PH/PC) kilns. Some of the reasons for this lower relative NO_X reduction include:

- In a long wet kiln, the NH_3 is sprayed in the kiln itself, rather than being sprayed in the ductworks in a PH/PC kiln. A kiln's diameter is much larger than the ductwork diameter which makes it more difficult for the liquid NH_3 to be evenly distributed across the entire cross section of the gas stream.
- Studies have shown that in long kilns, the gas stream can be highly stratified over the cross section. The relatively heavy CO_2 released from the raw materials tends to stay on the top and bottom of the raw material bed, while lighter O_2 tends to float to the top of the kiln cylinder. This theory has been proven by many actual measurements at the plant. In contrast, the ductwork in PH/PC kiln systems are mostly vertical and this stratification is not observed, or is much less than in the

horizontal kiln system. The combination of stratification in the kiln cylinder, and less even distribution of NH_3, compound the problem of poor contact between the NH_3 and NO_X.

- The reaction of NH_3 and NO_X includes multiple steps that require O_2. In the areas of the long kiln that are lacking in O_2, the reaction rate is significantly lower, and thus NOx reduction is significantly lower relative to a well mixed gas stream.

Based on the concerns with NH_3 slip at high molar ratios, and the uncertainty regarding the level of effectiveness of the reagent in Clarksville's large diameter kiln, Holcim anticipates that at a molar ratio of about 1.0, an average annual control efficiency of 20 percent could likely be achieved without excessive NH_3 slip. However, a pilot study would need to be conducted to verify this. Regardless, SNCR is considered to be a technically feasible option for NO_X control.

5.2.6 SELECTIVE CATALYTIC REDUCTION

Selective Catalytic Reduction (SCR) is an add-on control technology for the control of emissions of the oxides of nitrogen (NO_x) from a combustion process. SCR has been successfully employed in the electric power industry. The basic SCR system consists of a system of catalyst grids placed in series with each other within a vessel that is located in a part of the process where the normal flue gas temperature is in the required range. An ammonia-containing reagent is injected at a controlled rate upstream of the catalyst grids that are designed to ensure relatively even flue gas distribution within the grids, to provide good mixing of the reagent and flue gas, and to result in minimum ammonia (NH_3) slip.[14] The NH_3 reacts with NO_X compounds (i.e., NO and NO_2) on the surface of the catalyst in equal molar amounts (i.e., one molecule of NH_3 reacts with one molecule of NO_X). Common reagents include aqueous NH_3, anhydrous NH_3 and urea $[(NH_2)_2CO]$. In the presence of the catalyst, the injected ammonia is converted by OH^- radicals to ammonia radicals (i.e., NH_2^-), which, in turn, react with NO_X to form N_2 and H_2O. The SCR catalyst enables the necessary reactions to occur at lower temperatures than those required for Selective Non-Catalytic Reduction (SNCR). While catalysts can be effective over a larger range of temperatures, the optimal temperature range for SCR is 570 - 750º F.

The catalyst system used in SCR applications usually consists of (1) a porous honeycomb of a ceramic substrate onto which catalyst has been attached to the surface of the ceramic material, or (2) a flat or corrugated plate onto which catalytic material has been deposited on the surface. A porous metal oxide with a high surface area-to-volume ratio acts as a catalyst base. On this base, typically titanium dioxide (TiO_2), one or more metal oxide catalysts are deposited in various concentrations. In SCR applications, the active catalyst material typically consists of vanadium pentoxide (V_2O_5), tungsten trioxide (WO_3), and molybdenum trioxide (MoO_3) in various combinations. The composition, also known as the catalyst formulation, is tailored by the catalyst vendor to best suit a particular SCR application. Catalyst deactivation through poisoning, fouling, masking, sintering and erosion are common problems for SCR catalysts that, without careful process design and

[14] Slip refers to the quantity of unreacted reagent that exits the SCR reactor.

operation, could be exacerbated. If not fouled by sulfur dioxide (SO_2), the catalysts used in SCR have a propensity to oxidize sulfur dioxide (SO_2) in the flue gas to sulfur trioxide (SO_3), a more undesirable pollutant.

Because the reaction rate of NH_3 and NO_x is temperature dependent, the temperature of the flue gas stream to be controlled is the most important consideration in applying SCR technology to any combustion source. The optimum temperature range for SCR application is about 300º C (570º F) to 450º C (840º F). This range of normal process temperature would occur within the kiln of a long wet kiln, rather than in the exhaust gas between the wet kiln and the PMCD inlet.

SCR has not been applied to any wet cement plant in the world and is not considered an available technology.

As explained in more detail below, a technology is considered "available" if it can be obtained by the applicant through commercial channels or is otherwise available within the common sense meaning of the term. An available technology is “applicable” if it can reasonably be installed and operated on the source type under consideration. A technology that is available and applicable is technically feasible. Availability in this context is further explained using the following process commonly used for bringing a control technology concept to reality as a commercial product: concept stage; research and patenting; bench scale or laboratory testing; pilot scale testing; licensing and commercial demonstration; and Commercial sales.

A control technique is considered available, within the context presented above, if it has reached the licensing and commercial sales stage of development. A source would not be required to experience extended time delays or resource penalties to allow research to be conducted on a new technique. Neither is it expected that an applicant would be required to experience extended trials to learn how to apply a technology on a totally new and dissimilar source type. Consequently, technologies in the pilot scale testing stages of development would not be considered available. An exception would be if the technology were proposed and permitted under the qualifications of an innovative control device consistent with the provisions of 40 CFR 52.21(v) or, where appropriate, the applicable SIP [in which case it would be considered available].

Therefore, SCR is eliminated from further consideration as BART for NO_x control at the Clarksville plant.

.

5.3 RANK OF TECHNICALLY FEASIBLE NO_X CONTROL OPTIONS BY EFFECTIVENESS

The third step in the BART analysis is to rank the technically feasible options according to effectiveness. Table 5-3 presents potential NO_X technically feasible control technologies by effectiveness.

TABLE 5-3. RANKING OF TECHNICALLY FEASIBLE KILN NO_X CONTROL TECHNOLOGIES BY EFFECTIVENESS

Control Technology	Effectiveness NO_X Emissions Level (%)
MKF	20%
SNCR	20%
LNB, CKD Insufflation, and Synfuel	Already utilized at Clarksville

5.4 EVALUATION OF IMPACTS FOR FEASIBLE NO_X CONTROLS

Step four for the BART analysis procedure is the impact analysis. The BART determination guidelines list four factors to be considered in the impact analysis:

- Cost of compliance
- Energy impacts
- Non-air quality impacts; and
- The remaining useful life of the source

5.4.1 MKF

Cost of Compliance

Holcim anticipates that MKF and SNCR have relatively the same level of effectiveness. Because SNCR would require a pilot study to prove or verify the effectiveness of NOx reduction and the potential associated opacity issues due to ammonia slip (see Appendix B), Holcim is accepting the use of MKF as BART. As Holcim is accepting the most stringent control option available as BART, the cost of compliance is not required to be evaluated. Regardless, a cost analysis has been conducted for informational purposes.

Table 5-4 provides a summary of the cost effectiveness analysis related to MKF. The detailed cost analysis table is provided in Appendix D. The control cost factors were obtained from the EPA's Control Cost Manual, 6th Edition.

TABLE 5-4. COST ANALYSIS SUMMARY FOR MKF

Control Case	Control Effectiveness (%)	Annual Cost ($/yr)	Existing Annual Emissions (tons/yr)	Pollutant Removed (tons/yr)	Cost Effectiveness ($/ton)
MKF – PA	20%	$594,680	6,414	1,283	$464
MKF – PTE	20%	$594,680	8,462	1,692	$351

Energy Impacts and Non Air-Quality Impacts
There are no known adverse energy or non-air impacts from MKF. MKF of tires has the benefit of eliminating tires from landfills and illegal dumping. It also reduces CO_2 emissions (a Green House Gas) and reduces fossil fuel use.

Remaining Useful Life
The remaining useful life of the kiln does not impact the annualized costs of MKF because the useful life is anticipated to be at least as long as the capital cost recovery period, which would be 15 years.

5.4.2 SNCR

Cost of Compliance
As SNCR would require a pilot test, and the level of control/feasibility is in question, Holcim can not prepare a detailed cost analysis. However, an analysis was recently conducted for a portland plant with a wet process kiln in Midlothian Texas which reported a cost effectiveness of $2200/ton[15] which is significantly more than the $351/ton - $464ton for MKF. Regardless, as Holcim is accepting the most stringent control option available as BART, the cost of compliance is not required to be evaluated.

5.5 EVALUATION OF VISIBILITY IMPACT OF FEASIBLE NO_X CONTROLS

The final impact analysis was conducted to assess the visibility improvement for existing emission rates when compared to the emission rate with MKF. The existing emission rates and emission rates associated with MKF were modeled using CALPUFF. The existing emission rates are the same rates that were modeled for the BART applicability analysis. The NO_x emission rate associated with MKF was the existing emission rate less an average reduction of 20 percent. The emission rate is summarized in Table 5-5.

TABLE 5-5. SUMMARY OF EMISSION RATES MODELED IN NO_X CONTROL VISIBILITY IMPACT ANALYSIS

	Emission Rate		
Emission Rate Scenario	SO_2 (lb/hr)	NO_X (lb/hr)	PM_{10} (lb/hr)
MKF,	4,889	2,440	51.82
Base case – High 24 hr average	4,889	3,049	51.82

Comparisons of the 98th percentile existing visibility impacts and the visibility impacts based on MKF are provided in Table 5-6. The visibility improvements associated with MKF are also shown in Table 5-6; this was calculated as the difference between the existing visibility impairment and the visibility

[15] Assessment of NOx Emissions Reductions Strategies for Cement Kilns – Ellis County, Texas, Final Report. TCEQ Contract No. 582-04-65589, Work Order No.05-06. July 14, 2006. Page 1-12.

impairment for the remaining control options as measured by the 98th percentile modeled visibility impact.

TABLE 5-6. NO_X CONTROL VISIBILITY IMPACT ANALYSIS

	Existing 98% Impact (Δdv)	MKF 98% Impact (Δdv)	Improvement
Mingo	1.01	0.92	8.9%
Hercules	0.81	0.72	11.1%
Upper Buffalo	0.61	0.60	1.6%

As seen in Tables 5-6, the MKF option results in a visibility improvement of up to 11.1 percent in the Hercules Glades Class I area.

5.6 PROPOSED BART FOR NO_X

Based on the five step analysis outlined by EPA, MKF was identified as the highest ranking feasible add-on control technology. Economic, energy and environmental impacts were assessed for this technology and the visibility improvements were evaluated against existing conditions. The visibility impact analysis demonstrates that the utilization of MKF to achieve a 2,440 lb/hr NO_x emission rate results in up to an 11.1 percent visibility improvement. Neither non-air quality nor energy impacts associated with this control technology eliminate it in favor of retaining the existing rates as BART.

Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system or equivalent that will achieve a 20 percent reduction in the maximum daily NO_X emission rate of 73,185 lbs.

Consistent with BART applicability, which is determined on a daily basis, Holcim proposes to comply with an enforceable limit for NOx of 58,548 lbs/day which is a 20% reduction in the maximum daily NO_X emission rate of 73,185 lbs.

Based on the lack of site specific, or significant industry data, for the use of this technology on wet cement kilns, it is possible that Holcim will further evaluate the MKF system and determine that MKF results in limited or no additional benefit. In the future, an alternative technology or methodology may become feasible and could be implemented as needed. Holcim will continue to utilize the NOx controls that are already in place, including LNB, insufflation, and the use of alternative fuels as available.

6. BART SUMMARY

Based on the five-step analysis, Holcim proposes the following as BART:

Kiln:

- PM_{10} – Holcim has determined that the existing electrostatic precipitator constitutes BART. This control device is effective for controlling PM_{10} from a wet kiln.

- NO_X – Holcim has determined that BART for the Holcim Clarksville Kiln is the installation and operation of a Mid Kiln Firing (MKF) system or equivalent that will achieve a 20 percent reduction in the maximum daily NO_X emission rate of 73,185 lbs.

- SO_2 – Holcim proposes that BART for the Holcim Clarksville Kiln is fuel substitution or equivalent that will achieve a 23 percent reduction in the maximum daily SO_2 emission rate of 117,345 lbs.

The proposed BART control strategies will result in reductions of the visibility impacts attributable to the Clarksville plant. A summary of the visibility improvement at Class I areas based on the existing emission rates and proposed BART emission rates is provided in Table 6-1.

TABLE 6-1. VISIBILITY IMPAIRMENT IMPROVEMENT

	Mingo National Wildlife Refuge	Hercules Glades Wilderness Area	Upper Buffalo Wilderness Area
Existing 98% Impact (Δdv)	1.01	0.81	0.61
BART 98% Impact (Δdv)	0.79	0.64	0.48
Improvement 98% Impact (Δdv)	22%	21%	22%

Holcim proposes to implement BART on or before 5 years after EPA approval of Missouri's Regional Haze Rule State Implementation Plan as per 40 CFR 51 Appendix Y. Because the actual implementation date is at least 5 years from the date of this document, Holcim requests that it not be bound to the technologies reviewed during this analysis, but to the daily limits stated in the report. Changes in technology may offer opportunities to obtain even better reductions with lower cost impact.

Consistent with BART applicability which is determined on a daily basis, Holcim proposes to comply with an enforceable limit for SO_2 of 90,356 lbs/day which is a 23% reduction in the maximum daily SO_2 emission rate of 117,345 lbs.and a NOx limit of 58,548 lbs/day which is a 20% reduction in the maximum daily NO_X emission rate of 73,185 lbs..

APPENDIX B. REVIEW OF THE POTENTIAL FOR PLUME OPACITY EXCEEDANCES RESULTING FROM THE USE OF A WET SCRUBBER

Appendix B. Review of the Potential for Plume Opacity Exceedances Resulting from the Use of a Wet Scrubber.

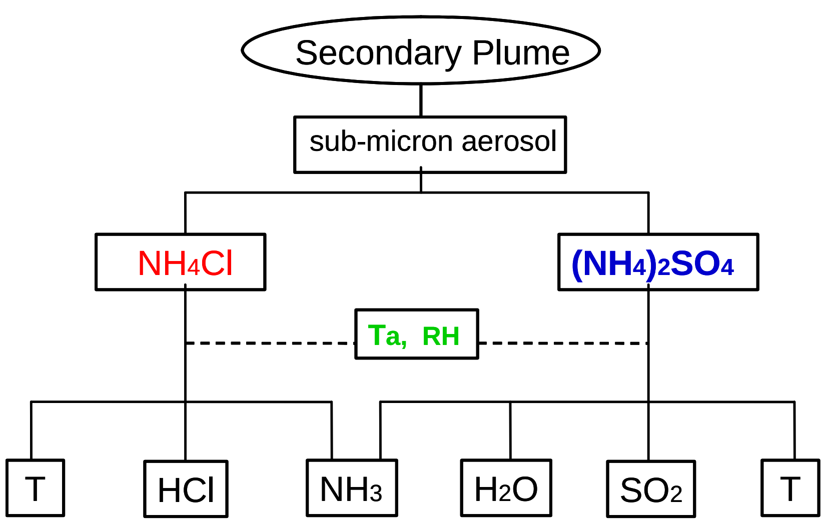
Nianzhi Wang, MPC-E

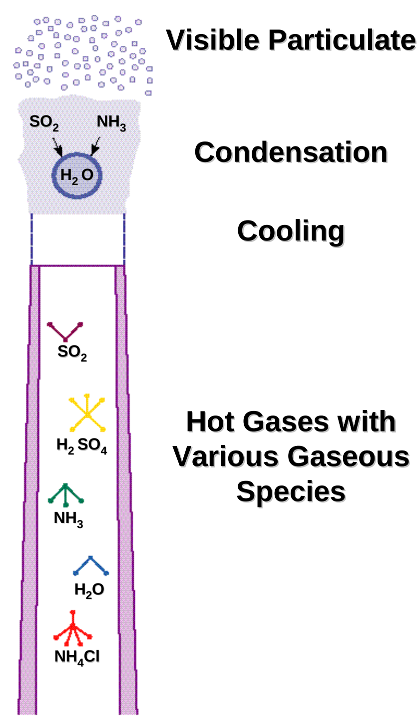
In the BART analysis for Holcim's Clarksville (CV) facility, a wet scrubber has been evaluated as a BART control option for SO_2. Although, a scrubber was shown to be technically feasible, it was also determined that reheating of the exhaust gas would be necessary to avoid a detached/attached plume. Following is an analysis of the gas stream to determine the specific temperature needed for the plume reheating requirement. The kiln system is currently controlled by an ESP and currently has an outlet gas temperature of approximately 380 deg F.

Background - The plume problem in cement manufacturing process

To evaluate the reheating requirement, we have to briefly introduce the plume problem in cement plants and potential risk of a visible plume after the scrubber.

The following figure shows the chemical reactions for most common types of plume in the cement manufacturing process, Although SO_3 and Total Hydrocarbons (THC) may also contribute to the plume, they have not been considered.





T = Stack Temperature, RH = Ambient Relative Humidity, Ta = Ambient Temperature

Some of the key points relevant to the diagram include:

- Both $(NH4)_2SO4$ and NH_4Cl are sub-micron aerosols that form at relatively low stack temperatures. $(NH4)_2SO4$ formation needs condensed moisture to occur. Whereas NH_4Cl solid can quickly form directly from the gas phase of NH_3 and HCl although with condensed moisture the reaction rate will be much faster.
- Sub-micron aerosols are similar in size to the wave length of light and thus strongly scatter the light and block light transmission through the stack gas. Figure 1 provides an example of relative light extinction versus particle size. For example, a $PM_{0.5}$ particle has an extinction efficiency approximately an order of magnitude greater than that of PM_{10}.

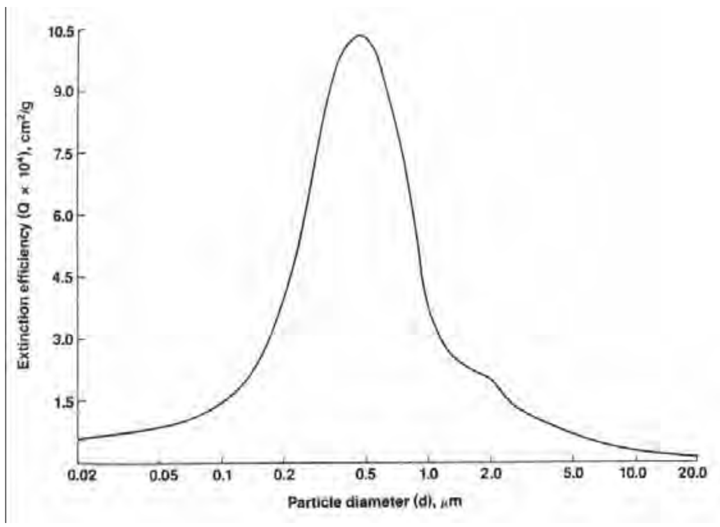


Figure 1. Extinction Efficiency Factor Verses Particle Diameter.

- The particle light extinction efficiency factor indicates the total light flux scattered and absorbed by a particle. Aerosols in the 0.2 - 1.0 μm diameter range are particularly effective in scattering visible light (wavelength: about 0.4 - 0.7 μm) on a unit mass basis, with a peak attenuation at 0.5 μm.

- The particles of either very large (>5 μm) or very small (<0.1 μm) diameter are much less effective in light attenuation.

- Plume aerosols usually form outside of the stack when the gas temperature is quickly cooled down and moisture is condensed, but the precursors have not had sufficient time to be diluted with ambient air. This situation is most dominant in occurrence on cold, calm and humid days.

Supplement A, at the end of this document, contains examples of historical visible plume problems in the cement industry and related studies.

Problems Associated with Using a Wet Scrubber on the Clarksville Kiln Exhaust Gas (in-stack)

- If a wet scrubber is installed after the Clarksville kiln, the kiln gas will need to be quenched and cooled down to the dew point temperature at the inlet of the scrubber (a similar condition of gas cooling in the presence of high humidity that can occur at the exit of a stack). If the gas has NH_3 and HCl, they can quickly react to form aerosols (fine particulate matter). These very fine particulates are controlled with a much lower efficiency than larger PM and thus can increase PM levels of the form of PM that leads to the highest plume visibility.

- In addition, the scrubber can not remove all NH_3 or SO_2 in the gas stream. The typical SO_2 reduction in a scrubber is about 90%. The NH_3 removal is governed by the equilibrium between the gas and the scrubber slurry liquid. Figure 2 provides the NH_3 gas-liquid equilibrium graph at a pH of 6. The NH_3 remaining in the effluent can be up to 10 ppm depending on the type of scrubber, the pH set point in the scrubber, and the scrubber influent NH_3 concentration. The remaining SO_2 and NH_3 in the scrubber effluent could react with the NH_4Cl aerosols already present in the gas and further increase plume visibility.

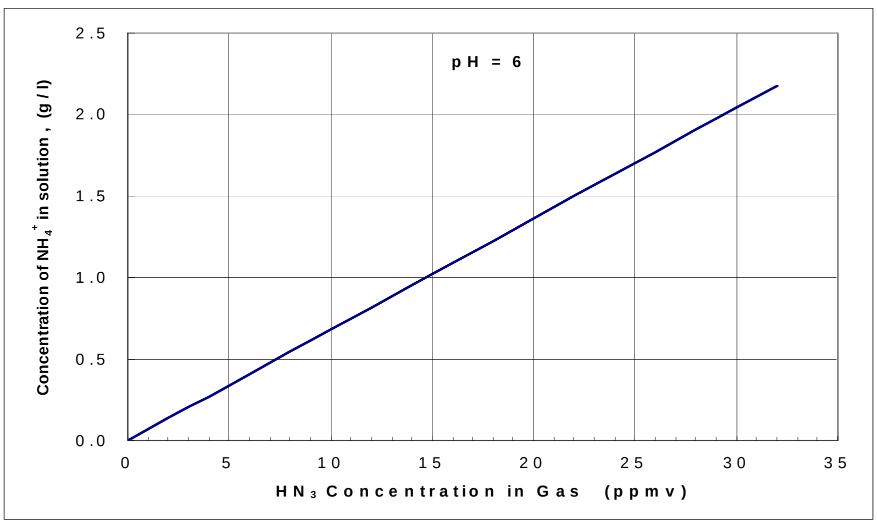

Figure 2. Concentration of NH_4^+ versus HN3 Concentration in Gas

- The gas temperature after the scrubber is much lower than the kiln gas temperature. Besides the aerosols formed at the inlet of the scrubber, more aerosols may also form in the cold and wet stack, and therefore, increase opacity.

Several scrubber vendors have confirmed the above phenomena with scrubber use:

- As an example, a vendor evaluated building a wet scrubber for one of Holcim's PH/PC plants. A PH/PC kiln system typically has two gas effluent streams, one contains high NH_3 (main stack) and the other contains high HCl (by-pass stack). Usually, both streams are introduced to a control device at the same inlet,

However, in this situation, the vendor provided the following concerns/comments in doing so as part of a feasibility study for the plant[1]:

> *"Mixing the NH_3 and HCl streams at the inlet will indeed produce an NH_4Cl salt that will be submicron in size".*
>
> *"This will result in opacity, I am sure it will be greater than 20%. Once this salt is formed, it will be very difficult to remove. Therefore, the preferred treatment would be to absorb the gases before they have a chance to react".*
>
> *"As we discussed, the two separate gas streams can be treated with individual scrubbers. However, it would be less expensive to perform the scrubbing in a single, large vessel with two separate inlet barrel"*

The scrubber system was ultimately built by Monsanto. And, even though the problem was acknowledged, and the system was designed to prevent the visible plume problem, the plant still has challenges with plume formation during the winter.

<u>Kiln gas emission concentrations and opacity</u>

- Holcim, as well as other companies, have found that at about 5ppm NH_4Cl or 10ppm $(NH4)_2SO4$, detached plumes can form outside of the stack if the stack gas is not hot enough to allow for significant dilution prior to condensation or if it is a very cold day in winter. Both aerosols will form quickly when the stack gas is cooled down by very cold ambient air.

- Stack temperatures for wet kilns are typically about 350 F. PH/PC kilns have similar stack temperatures when their in-line raw mills are not running. During these periods, PH/PC kilns have also observed a higher frequency of visible plumes as the precursors, NH_3, HCl and SO2, are not absorbed in the in-line raw mill.

Some specific examples of plants with visible plumes caused by constituents with concentrations similar to those in the Clarksville plant include:

- The CEMEX plant at Cementos Guadalajara, a 4 stage PH/PC kiln, had a highly visible plume caused by NH_4Cl. To resolve the problem, the plant added two additional stages that increased pollutant adsorption (HCl emissions were reduced to 5 ppm) and the plume disappeared. The reported stack temperature is 260 C (500 deg. F) which is much hotter than that of Holcim's Clarksville plant. Further, Clarksville's long wet kiln does not have the benefit of the stages in the PH/PC kiln for enhanced adsorption.

[1] *Steven Meyer, product Manager of Monsanto Company. Letter to Holcim for feasibility study of wet scrubber project, 10/29/1998*

- Holcim's Mississauga plant had a highly visible plume during the winter until they eliminated condensed moisture formation by heating the gas and reducing the HCl concentrations to less than 3-5 ppm. Holcim's Clarksville kiln can have HCl concentrations much higher than 5 ppm as will be discussed in a following section.

- Holcim's Untervaz plant in Switzerland has a wet scrubber as well as high levels of HCl and NH_3 in the kiln gas, and they have reported visible plumes during the winter especially when the in-line raw mill is down and the pollutant concentrations are higher.

Impact of Temperature on Visibility – Reaction Rate Based Equations

Solid NH_4Cl aerosols can form directly from the gas phase through the following reversible chemical reaction when the temperature drops:

$$NH_4Cl\ (s) = HCl\ (g) + NH_3\ (g)$$

The thermodynamic criteria for the reaction to occur is determined by the equilibrium constant Kp, which can be expressed by the following equation[2]

$$\ln Kp = 34.266 - 21196/T$$

where T is the temperature (K). The chemical reaction takes place if the product of partial pressures of HCl and NH_3 in gas is greater than Kp, i.e. $(pHCl \cdot pNH_3) > Kp$ (pHCl & pNH_3 are both in atm). This reaction can keep going to form NH_4Cl until the partial pressures of NH_3 and HCl have dropped to a level such that their product is less than Kp.

If the CV plant utilized a wet scrubber, and we assume the scrubber inlet temperature after quenching is 170 deg F or 76.6 deg C, the Kp would be 3.6 E-12. In the kiln gas, concentrations as low as 1-2 ppm (1.0 E-06 - 2.0 E-6) NH_3 and HCl will make the $(pHCl \cdot pNH_3) > Kp$, and the reaction will not stop until both gas phases drop down to 1-2 ppm. Thus, almost all NH_3 and HCl with a concentration higher than 1-2 ppm in the kiln gas will form NH_4Cl aerosols in the scrubber.

Reheating the stack gas after the scrubber has two purposes:

1) Dissociate the newly formed NH4Cl solid

2) Prevent the formation of aerosols from NH_3 and HCl from forming again in the stack or near the stack. The higher the reheating temperature, the longer the

[2] P. Goldfinger, G. Verhaegen, "Stability of the Gaseous Ammonium Chloride Molecule", The Journal of chemical Physics, 50(1), 1467-1471 (1969)

gas has to disperse and be diluted with ambient air, so that the product of both NH_3 and HCl concentrations would not be higher than Kp, and no aerosol formation would occur.

An example of how reheating temperature affects the opacity in a power plant is depicted in Figure 3[3]. The precursor of the visible plume in this case is SO_3, (as opposed to NH_4Cl).

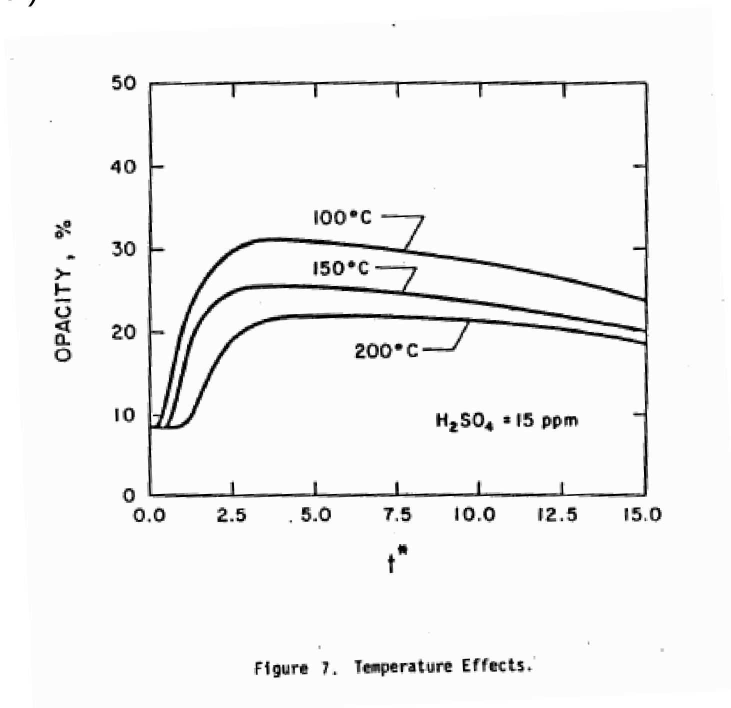

Figure 3. Gas Temperature Effect on Opacity Verses Time (t*)

Although reheating the stack gas to a temperature above the acid gas dew point may help to reduce corrosion problems and in-stack opacity, it may not be enough to avoid a plume outside of the stack. When the gas exits the stack, the temperature will quickly drop to below the acid dew point. Acid gas may be condensed, and acid water droplets may occur that will speed up other reactions in the liquid phase.

Figure 4 shows an example for stack gas containing SO_3. The gas temperature in the stack is much higher than the acid dew point, but once it goes out of the stack it takes only one second for the plume temperature T_P to drop below the dew point temperature T_{DP} and cause higher opacity levels.

[3] J. J. Martin Hughes, "Fine Particle Model for Detached Plume Opacity", Virginia State University, 16th Annual Meeting of the Fine Particle Society, April, 1985.

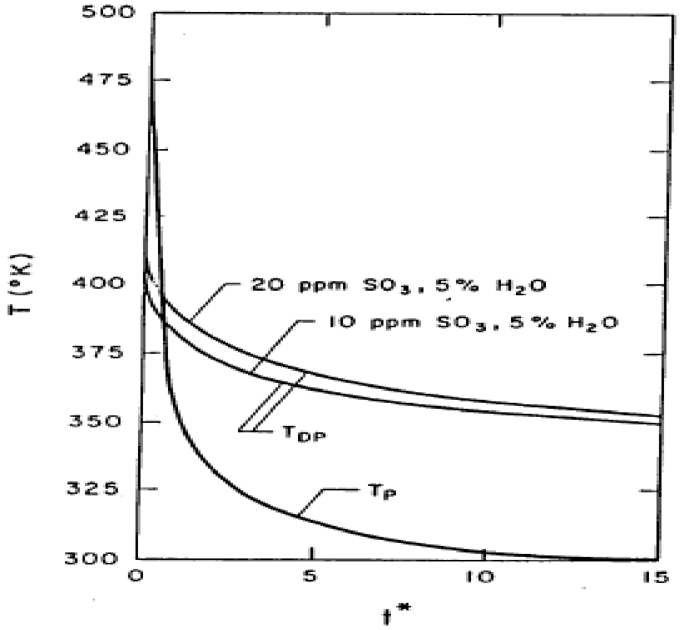

Figure 4. Stack gas temperature vs. Acid Dew Point and Time

Besides pollutant concentrations, other factors such as the stack gas temperature and moisture, the ambient air temperature and humidity, wind speed, sunlight and sky clarity, stack size and height effect plume visibility. Therefore, it is almost impossible to predict the exact reheating temperature required. Regardless, a mathematical model has been established to provide a simplified simulation of NH_4Cl formation outside of the stack based on the actual conditions at the CV plant.

Estimating the Reheat Temperature for CV based on Plant Data

The NH_3 and HCl emission concentration will control the plume formation as SO_2 concentrations are likely to be sufficiently high as to not be limiting in any equations. Table 1 summarizes the CV annual stack testing for 2002 - 2007. Although HCl was relatively low in 2007, it can and has varied significantly over the last five years.

Table 1. HCl and NH_3 Stack Test Data for Clarksville – 2002 thru 2007.

CV Emission		HCl		NH3
	ppmd	ppmw	ppmd	ppmw
2002	12.8	9.1	36.2	25.7
2003	30.3	21.5	20.6	14.6
2004	26.9	19.1	27.1	19.2
2005	14.4	10.3	16.0	11.5
2006	8.0	5.6	22.5	15.7
2007	2.7	1.9	24.9	17.6
Average	15.9	11.2	24.6	17.4

Please note that this data is from once per year stack testing not a Continuous Emission Monitor (CEM) and thus the annual and daily emission levels may vary considerably from these values. Further, the peak annual emission may be much higher than the test average. For example, during the three hours of stack tests in 2004, the maximum hourly HCl concentration was 70% higher than the minimum and 23% higher than the average.

Further, under current operations in 2007, the plant found that during some cold days, the plume outside of the stack was visible, but it did not reach 20% opacity.

The current stack temperature is about 350 F, and the temperature at the outlet of the ESP is about 380 F. The lower temperature in the stack is due to heat loss in the ductworks and the I.D. fan. Therefore, a reheating temperature of 380 F is proposed to maintain the current stack temperature of 350 F and eliminate the plume formation after the scrubber.

Using the 2007 stack test data (2 ppm HCl and 18 ppm NH_3), a reheat temperature of 380 F, or 350 F stack temperature, might not be necessary since based on our modeling result, the total HCl and NH_3 as aerosols after the scrubber should not be higher than in the original kiln gas.

However, HCl concentrations in the prior years have been as much as 10 times higher than 2007, reaching over 20 ppm in 2003 and 2004, while the NH_3 concentrations were nearly 20 ppm. These levels are considered to be highly probable of causing a visible plume at the current exhaust temperatures. Reviewing historical data, it was found that stack temperatures during these time periods were much higher than current temperatures. For example, the stack temperature was maintained at approximately 700 deg. F in 2003 and approximately 450 deg F (480 deg F at the outlet of the ESP) in 2004 (100 F higher than the proposed reheating temperature). The higher temperatures likely prevented significant visible plumes from occurring.

Regarding the use of a wet scrubber, even if some reduction in HCl occurred (such as 20%), the total HCl concentration after the scrubber would still be significantly higher than that in the kiln gas in 2007. Under this scenario, reheating to an ESP outlet of 380 F, or 350 F stack temperature, would likely not be sufficient to assure a stack opacity below 20% and additional re-heating would likely be required. Consequently, the proposed 380 F reheating temperature should be considered as an average for the year. That is, if the HCl and NH_3 concentrations reach 20 ppm in the kiln gas, the reheat temperature may need to be 480 deg F or higher in the winter, while if the HCl and NH_3 concentrations drop to 2007 levels or below, a reheat temperature of less than 380 deg F may be sufficient in the summer. Therefore, considering the variation in the HCl and NH_3 concentrations, an annual average reheat temperature of 380 deg F may be sufficient.

Is scrubbing half of the exhaust stream, and using the unscrubbed half for reheat, a viable option?

A scenario in which half or the exhaust gas stream is scrubbed, and the other half is not, followed by recombining the gas streams, was also considered. If feasible, this scenario would result in the unscrubbed gas providing the heat source to re-heat the scrubbed gas up to a temperature midway between the scrubbed gas temperature of approximately 170 deg F and the unscrubbed gas temperature of approximately 380 deg F, resulting in a mid-range temperature gas stream of approximately 275 deg F. Unfortunately, as discussed previously, the variability in precursor pollutant (HCl and NH_3) concentrations would most certainly lead to a visible plume at this low temperature and re-heating would continue to be required up to the originally identified average temperature of 380 deg F. This option was one of the scenarios evaluated in the modeling exercise discussed in the following sections.

Mathematical analysis of the impact of reheating temperature on CV visible plume

Using the equation described previously,

$$\ln Kp = 34.266 - 21196/T$$

a mathematical model was established to simulate NH_4Cl formation outside of the stack. Based on Holcim's experience with visible plumes at multiple plants, an NH_4Cl aerosol concentration of 5ppm in the atmosphere is used as the criteria for a highly visible plume outside of the stack. In reality, some of Holcim's plants control their NH_4Cl aerosol concentrations to less than 1-3 ppm to avoid visible plume formation.

This model only considers the gas temperature reduction due to mixing with ambient air and does not consider any reduction due to radiation. Thus, the actual condition will be worse than what the model predicts.

NH_4Cl formation was simulated for the following scenarios:

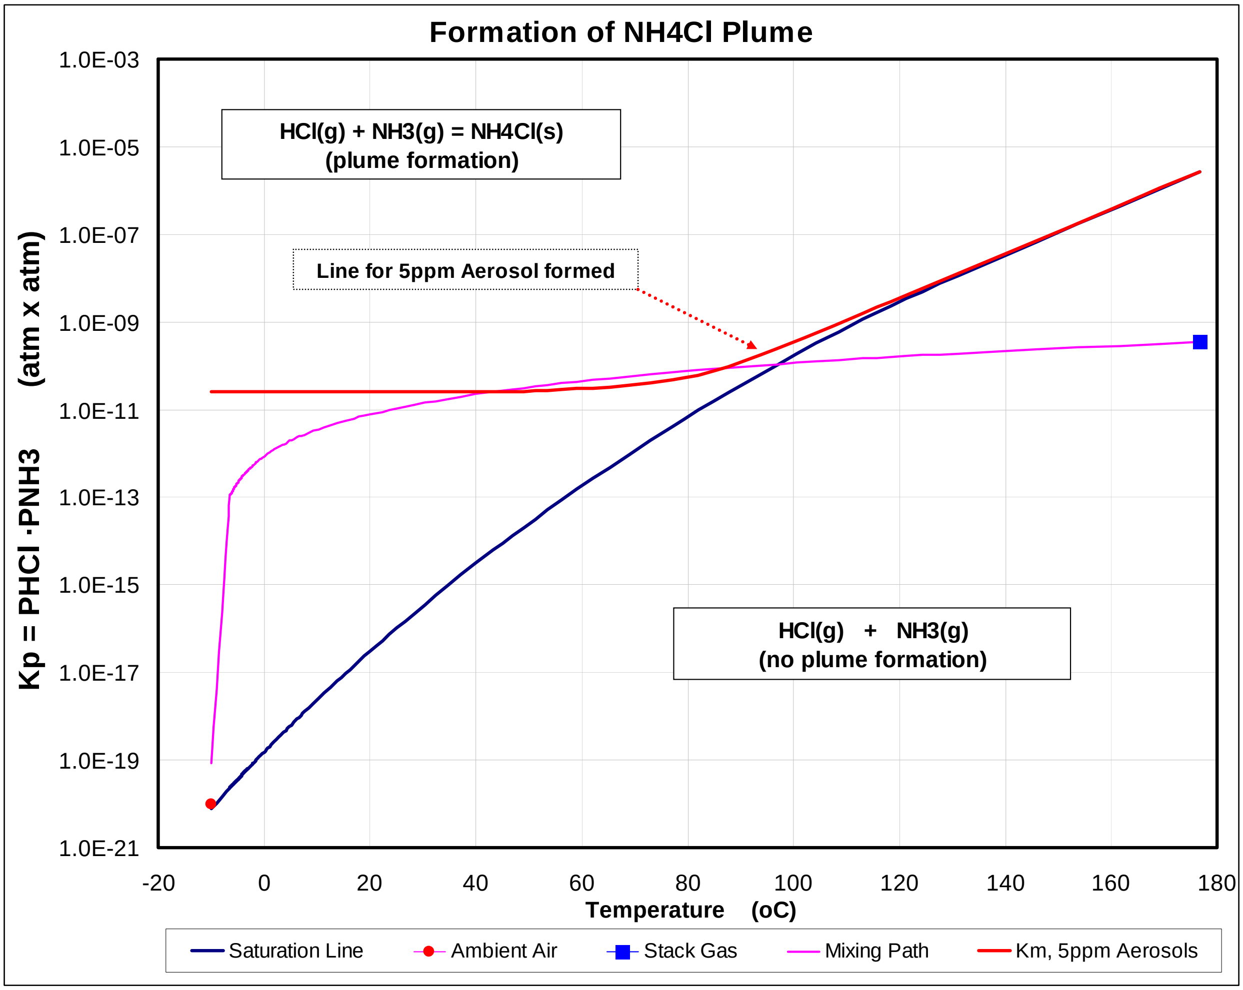
- Scenario 1. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating to 380F and Winter Condition
- Scenario 2. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating to 380F and Summer Condition
- Scenario 3. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and Winter Condition
- Scenario 4. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and winter Condition
- Scenario 5. Average of the NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and winter Condition

- Scenario 6. Average of the NH_3 and HCl concentrations for the last 4 years, reheating of 50% kiln gas (300F) and summer Condition
- Scenario 7. Average of the NH_3 and HCl concentrations for the last 4 years, reheating of 380 F and summer Condition
- Scenario 8. Maximum stack testing NH_3 and HCl concentrations for the last 4 years, reheating to 480F and Winter Condition

Additional Model Assumptions/Calculations:

The model assumes that in each interval 50% of the original stack gas volume will be diluted with ambient air. Based on this dilution, and with respect to the ambient and stack gas specific heat, the temperature of the mixture will be calculated. Next, the Kp line which represents the equilibrium condition is drawn by inserting the temperature in the above formula. The corresponding concentration of HCl and NH_3 of the gas mixture is calculated at each interval, converted to partial pressures and multiplied with each other to find the Mixing Path value (Km). The Mixing Path (Km) at the corresponding temperature represents the calculated gas conditions at that interval. Then the Km+5 line which corresponds to the concentration of NH_3 and HCl that will result in the formation of at least 5 ppm of aerosols is drawn,. At any point that the Mixing Path and Km+5 lines cross each other at least 5 ppm of aerosols has been formed.

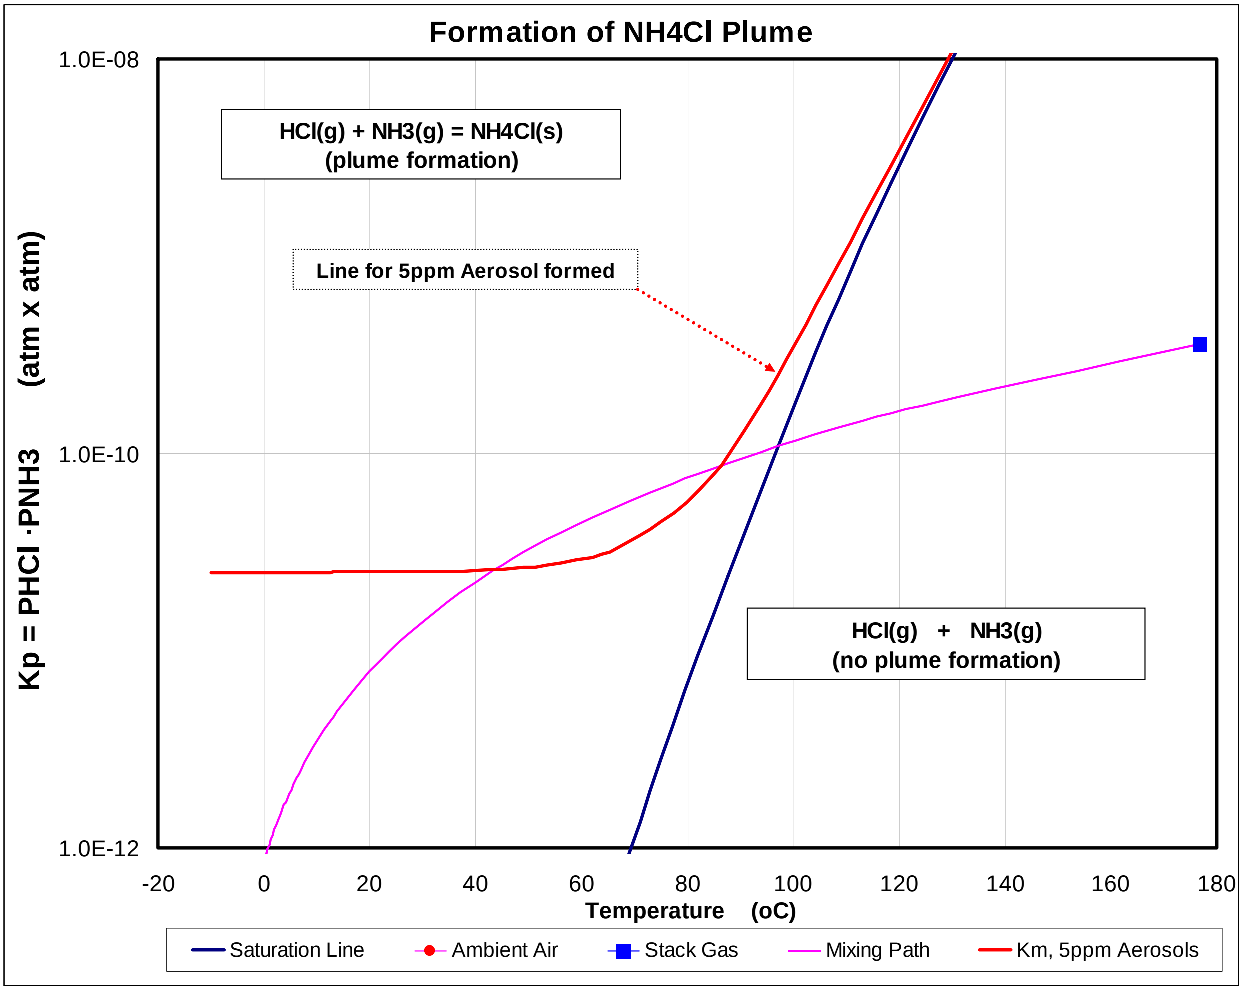
Scenario 1 (Figure 5) represents the 380°F reheating temperature and stack temperature of 350°F, an ambient temperature of 14°F (representing a typical winter temperature), and the five year maximum NH_3 and HCl concentrations of 27 ppmv, dry. Furthermore, it shows that the Km and Mixing path lines cross at around 85°F and will form more than 5 ppm of aerosol NH_4Cl. Thus, a visible plume would be predicted.



Conditions	° F	° C
Ambient Air Temperature	14	-10
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 5

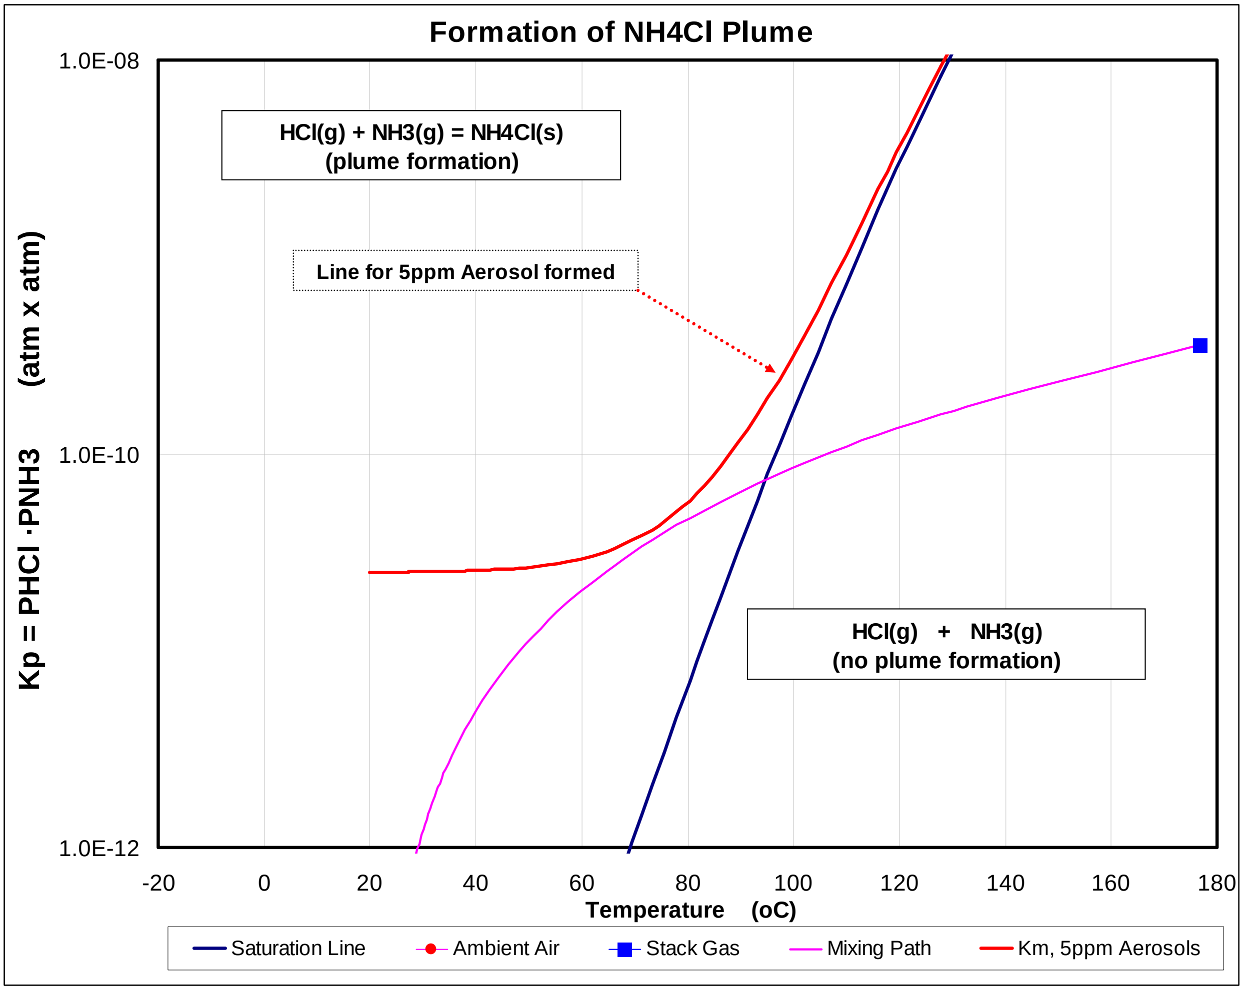
Figure 6 has the same ambient and stack temperatures as well as pollutant concentrations as Scenario 1, but provides more detail (zoomed in view) where the Km and Mixing Path lines cross.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 6

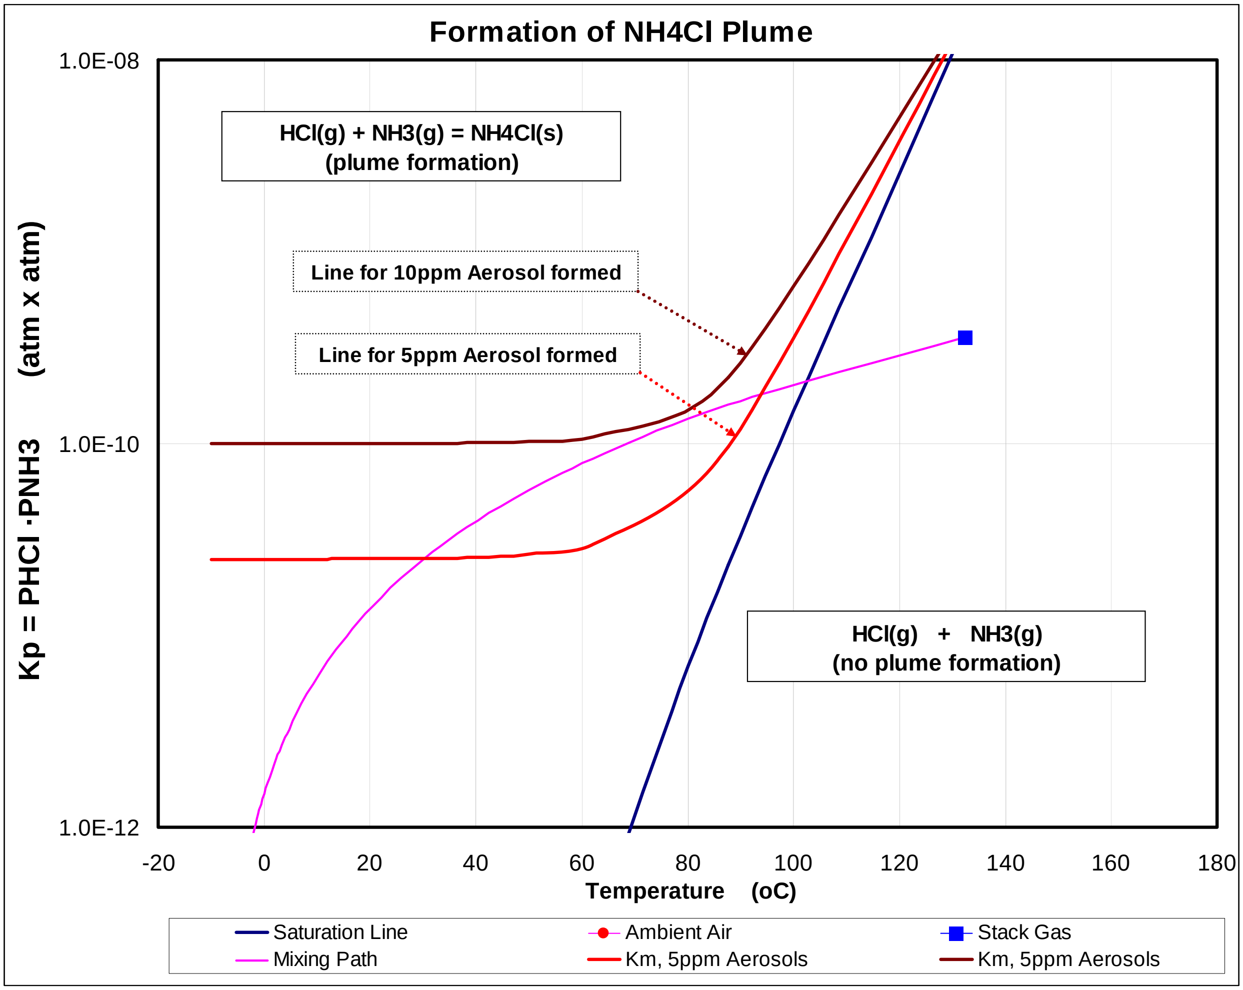
Scenario 2 (Figure 7) represents the situation in Figures 5 & 6 (380 F reheating and 350 F stack temperature) but at a typical spring/summer temperature of 68°F. At these conditions, the Mixing Path barely misses the line representing 5 ppm aerosol NH_4Cl formation. Thus, a visible plume formation is not anticipated.



Conditions	°F	°C
Ambient Air Temperature	68	20
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 7

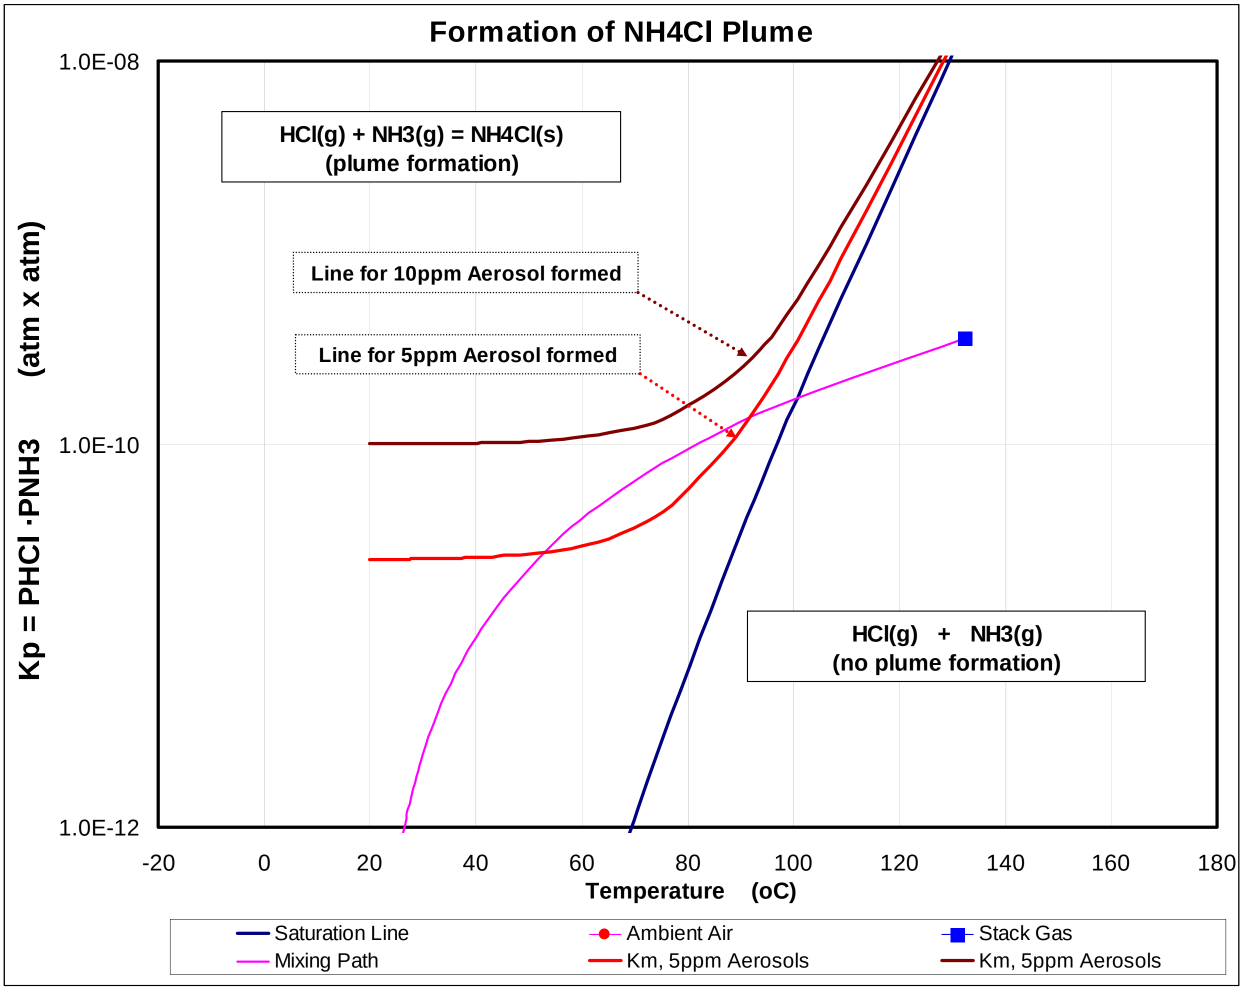
Scenario 3 (Figure 8) provides a reheating gas temperature of 300 °F corresponding to a stack temperature of 270 °F and the maximum 5 year pollutant concentration of 27 ppmv, dry at winter ambient conditions. At this stack temperature, the Mixing Path crosses the 5 ppm aerosol NH_4Cl formation line and nearly crosses a 10 ppm aerosol NH_4Cl line. This scenario has a very high risk of a visible plume problem with >20% opacity.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 8

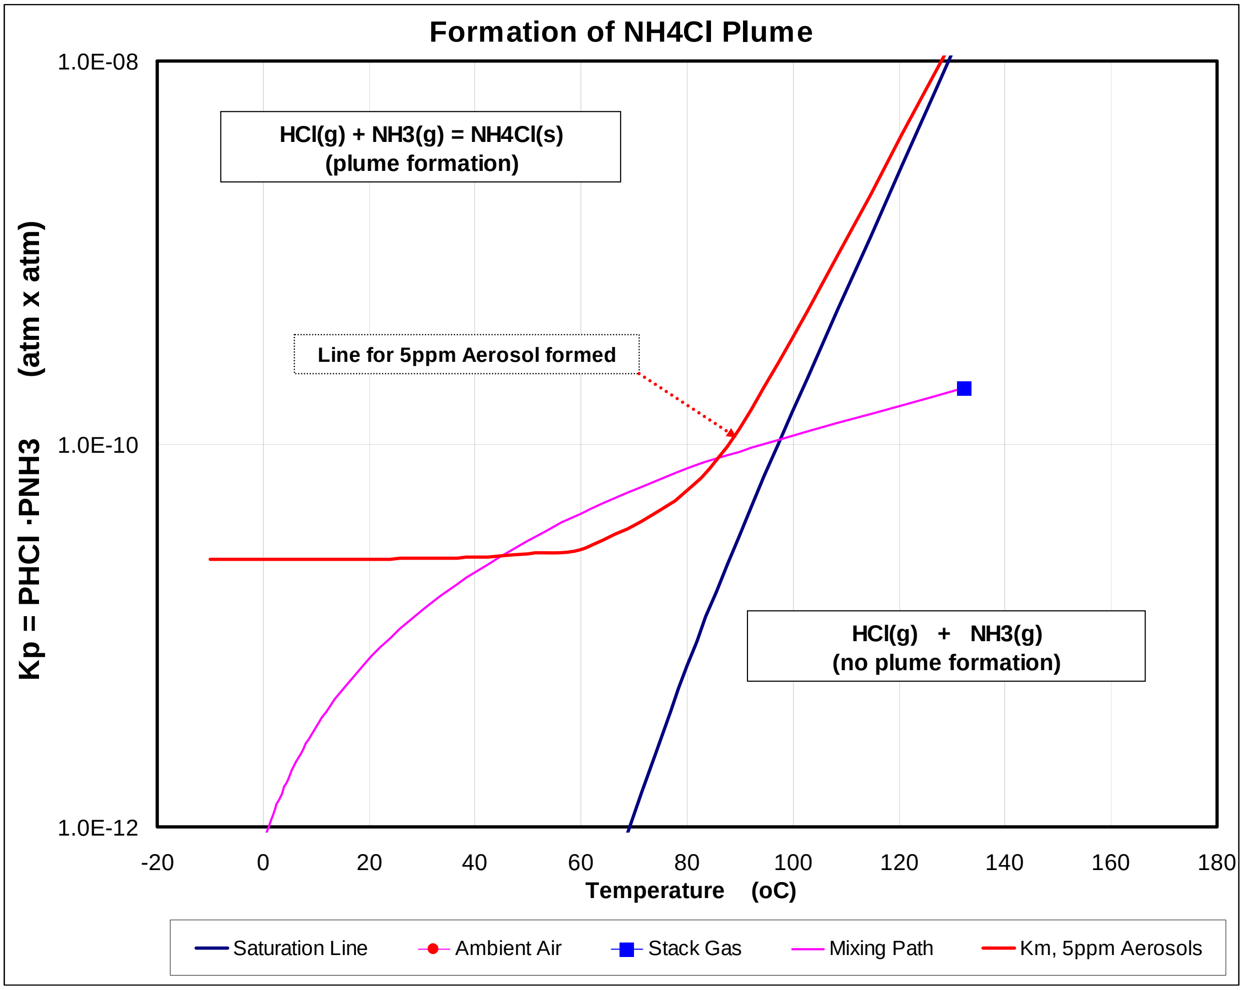
Scenario 4 (Figure 9) provides a reheating gas temperature of 300 °F corresponding to a stack temperature of 270 °F and the maximum 5 year pollutant concentration of 27 ppmv, dry (same as Scenario 3) but at typical spring/summer ambient temperatures. At this stack temperature, the Mixing Path still crosses the 5 ppm aerosol NH_4Cl formation line. This scenario also has a high risk of a visible plume problem. However, it is not predicted to be as severe as the previous scenario.



Conditions	°F	°C
Ambient Air Temperature	68	20
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

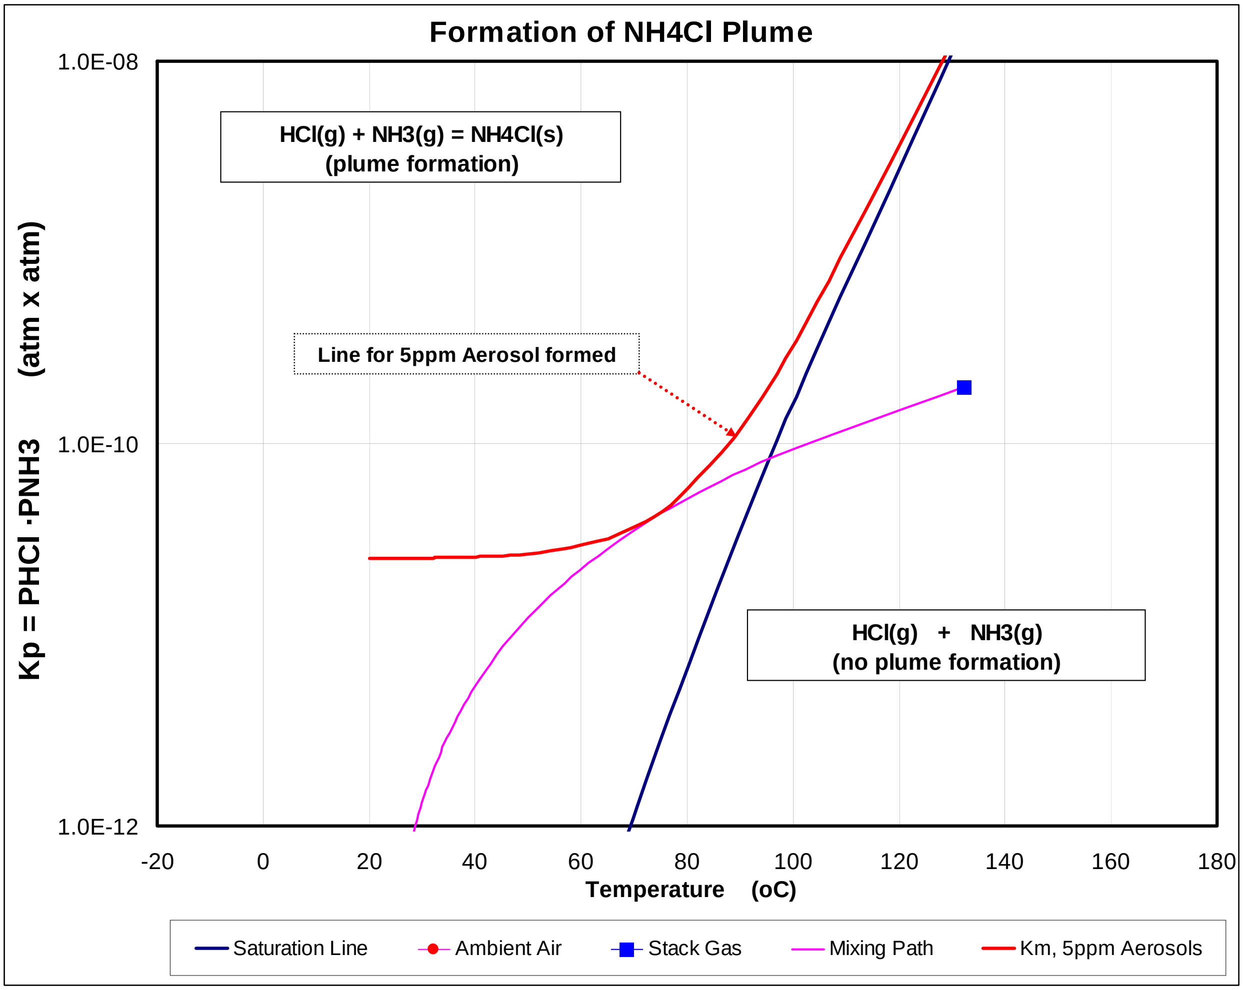
Figure 9

Scenarios 5 and 6 (Figure 10 and Figure 11). Under these temperatures, the average 5 year concentration of NH_3 (25 ppmv, dry) and HCl (16 ppmv, dry) is predicted to form more than 5 ppm of aerosol NH_4Cl at an average winter temperature (Figure 10) and close to 5 ppm at an average summer (Figure 11) ambient temperature.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	16	
NH_3 Concentration (ppmv, dry)	25	

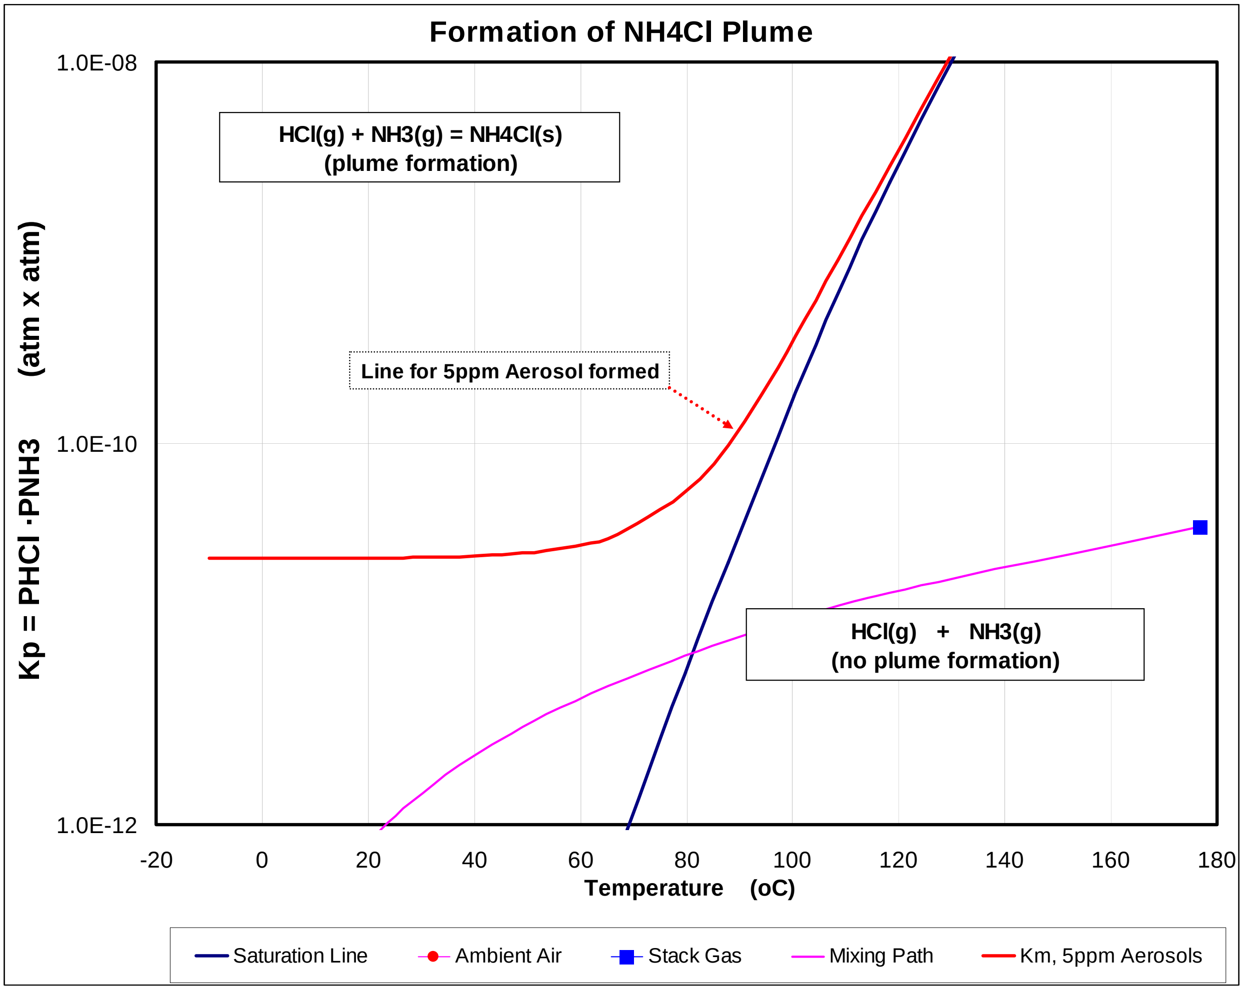
Figure 10



Conditions	°F	°C
Ambient Air Temperature	68	20
Reheating Temperature	300	149
Stack Temperature	270	132
HCl Concentration (ppmv, dry)	16	
NH_3 Concentration (ppmv, dry)	25	

Figure 11

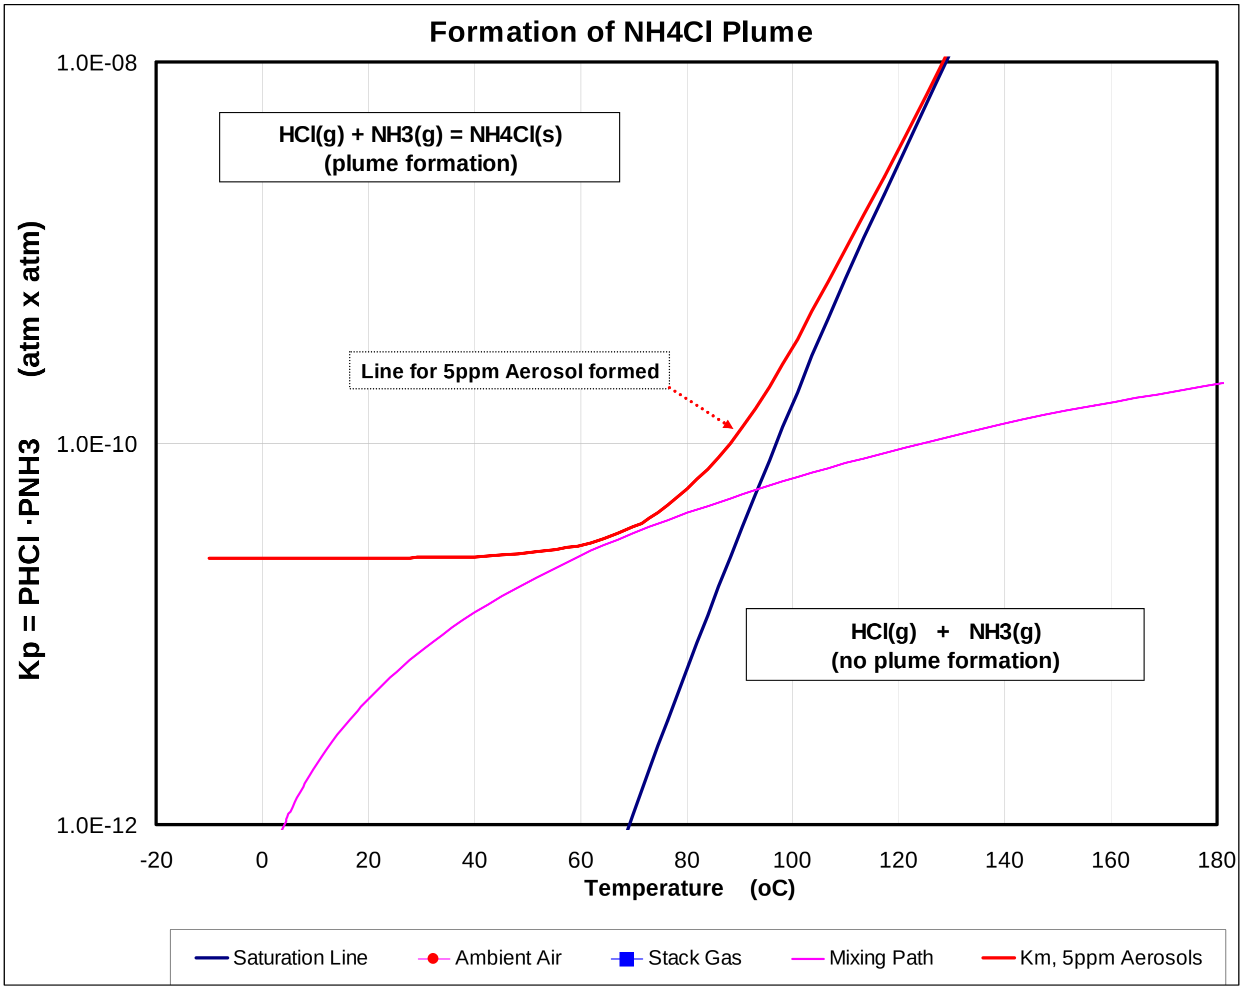
Scenario 7 (Figure 12) represents the actual 2007 condition of the Clarksville plant at a typical winter temperature. It is apparent that the Mixing Path line and Km are not crossing since the total HCl concentration is only 3 ppm. Note that the HCl concentration in 2007 was the lowest of the 5 years and could vary to more than 30 ppm as found in 2003.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	380	193
Stack Temperature	350	177
HCl Concentration (ppmv, dry)	3	
NH_3 Concentration (ppmv, dry)	25	

Figure 12

Scenario 8 (Figure 13) shows the actual 2004 conditions of the plant at a typical winter ambient condition. Although the HCl and NH_3 concentrations are relatively high, the high stack temperature (480 deg F) allows for dilution and the Mixing Path line does not cross the Km line and therefore less than a 5 ppm aerosol NH_4Cl concentration is predicted.



Conditions	°F	°C
Ambient Air Temperature	14	-10
Reheating Temperature	480	249
Stack Temperature	450	232
HCl Concentration (ppmv, dry)	27	
NH_3 Concentration (ppmv, dry)	27	

Figure 13

Conclusion

In conclusion, the stack temperature needed to prevent a visible plume from occurring is highly dependent on the ambient temperature, the concentrations of HCl and NH_3 in the gas stream, as well as other factors. Due to the normal variability in HCl and NH_3 concentrations, it is virtually assured that the combination of higher HCl and NH_3 concentrations and lowering the stack gas temperature below current levels (380 deg F at the exit of ESP and 350 deg F at stack) would lead to a visible plume condition.

Supplement A: Some Examples of plume problems in cement Industry

The first regulatory action concerning secondary plumes in the cement industry occurred in 1979 at Glens Falls Cement, Glens Falls, New York, USA. Plume studies were conducted by EPA and stack test contractors by sampling the plume using a tethered balloon.

The secondary plume was observed to have an average opacity of ~85% while the in-stack opacity was only 10%. The tests revealed that the particulate matter recovered from the plume was mainly crystals of ammonium sulphate. The tests indicated that the primary components of the stack effluent were $(NH4)_2SO4$ (4.5 ppm), SO_2 (200 ppm), NH_3 (170 ppm), moisture (20%). The ammonium sulphate in the stack gas was responsible for the 10% in-stack opacity.

The secondary plume was also observed at Lehigh Cement in Leeds, Alabama, USA. Testing conducted in 1981 indicated that the major species responsible for the plume was ammonium chloride, NH4Cl.

Similar tests were conducted in 1987 at Kaiser Cement in Permamenti, California, USA. The results revealed that NH4Cl was also responsible for the visible secondary plume. The secondary plume tests conducted in 1987 at Southwestern Portland Cement in Victorville, California, USA, also revealed that NH4Cl was responsible for the visible secondary plume.

In 1986, EPA conducted a source and process sampling program at the South Dakota Cement Company, Rapid City, South Dakota, USA. The samples collected from the secondary plume contain up to 67% NH4Cl. Further tests indicated that the NH3 exists mainly in the shale that accounts for about 20% of raw mix. The plant has a dry process with a 4-stage preheater, vertical roller mill for raw grinding and a main baghouse for dedusting. A severe ammonia recirculation was observed, with an average NH3 content in shale being 6.2 ppm while up to 159 ppm NH_3 was found in the baghouse dust. It was also observed that the NH3 content in the baghouse dust was reduced substantially when gas temperature increased from 170 deg C (compound operation) to 250 deg C (direction operation).

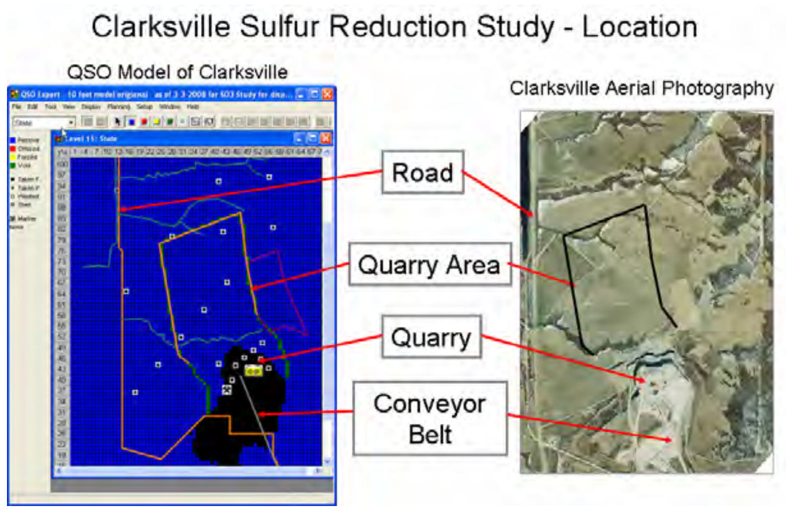
The secondary plumes in cement plants are not limited to the USA. They have also been reported by a Mexican cement company which determined through plant measurements that NH4Cl was responsible for the visible plume.

Other examples include the Lone Star Industries' Cape Girardeau Cement Plant, MO, USA and the Inland Cement, Edmonton, AB, Canada. Both plants experienced secondary plumes due to formation of ammonium sulphate.

APPENDIX C. SELECTIVE MINING – QUARRY SCHEDULING OPTIMIZATION DISCUSSION

Appendix C. Selective Mining – Quarry Scheduling Optimization Discussion

Holcim (US) Inc. evaluated the Clarksville Quarry Scheduling Optimization (QSO) model for sulfur emissions.

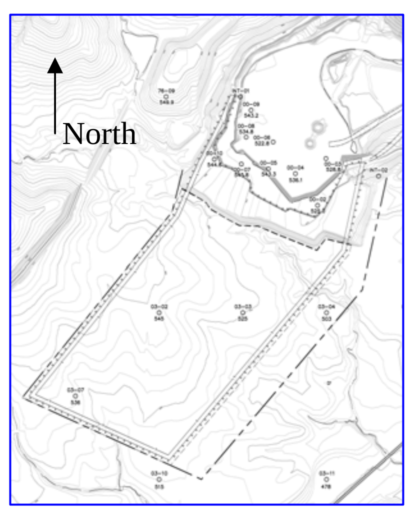


The model is based on statistical and spatial analysis of data obtained through drill core sub sampling. Validation of relevant data is insured through the analysis of varagrams and histograms. This validation insures that correlation between samples is relevant.

The Clarksville QSO Model was created specifically for predicting relevant mineralogical parameters related to clinker production. Major oxides (Ca, Mg, Si, and Fe) are the primary focus of this predictive model. The sampling protocol and data analysis required for major oxide components was never intended to be adequate for the accurate prediction of minor components, such as sulfur and sulfur compounds.

When placed under scrutiny, existing data was found to be inadequate for accurate prediction of S content in the potentially quarried shale. Spatial relationships between core samples were found to be inappropriate for the sensitivity needed to make accurate predictions. The reason for this is the geologic nature of the Maquiketa Shale and Kimmswick Limestone, of which the primary sulfur mineral is pyrite (FeS).

One of the most important chemical processes in organic-rich marine sediments, such as Maquiketa shale, is decomposition of organic matter (OM)in bacterial sulphate reduction. Bacterial sulphate reduction produces bisulphide. Bisulphite can be partially oxidized or can react with OM and reactive metal species. All these reactions may be bacterially mediated. The reaction of reduced sulfur with reactive dissolved iron and iron minerals, if available, results in the formation of iron sulphides. The most common iron sulphide in pyrite.



The amount of pyrite formation in marine sediments is largely determined by the availability of sulphate, reactive iron and reactive OM during the formation of

the sediments. The locations of the reactive iron and sulphate are a random occurrence, usually along planes of weakness or channels of solubility during rock forming (induration). The pyrite is formed as nodules or clusters of mineralization and is not evenly distributed spatially throughout the shale and limestone.

Therefore the chance of intercepting a pyrite cluster of mineralization by core drilling is known as a ‘nugget’ effect. Intercepting a pyrite cluster will give artificially high sulfur values in the model and, conversely, not intercepting pyrite mineralization can give low values.

In the planned mining area only 5 core holes were drilled (DH-2, DH-3, DH-4 and DH-7). While the spacing of the drill holes are adequate for predicting major oxides, they are too far apart and too few to accurately predict clustered mineralogy such as pyrite.

Table D-1. Wet Limestone Scrubber Control Cost Analysis Based on Projected Actual Emissions and 80% Control.

Direct Costs			
Purchased Equipment Costs			
	Wet Scrubber Unit including Limestone Prep System, inflated to 2012 dollars		$17,317,574

Holcim-Clarksville BART Draft Consent Agreement

August 18, 2008

STATE OF MISSOURI
Matt Blunt, Governor • Doyle Childers, Director
DEPARTMENT OF NATURAL RESOURCES
www.dnr.mo.gov

AUG 1 8 2008

Mr. Alan Greer
Plant Manager
Holcim – Clarksville
14738 Highway 79
Clarksville, MO 63336

Re: Best Available Retrofit Technology (BART) finding and Consent Agreement for Clarksville's kiln system

Dear Mr. Greer:

The following is a summary of the Department of Natural Resources finding for BART on the Clarksville kiln system. With respect to oxides of nitrogen (NOx), the department has received a portion of this study from CINAR Company detailing the emission reductions achieved by mid-kiln firing of tire-derived fuel (TDF). The department is requesting the full study to complete the necessary technical review. Based on confirmation of the results from this study, the department will likely find that mid-kiln firing of TDF will result in a cost-effective control on NOx that will satisfy BART for Holcim-Clarksville. This finding is supported by the following:

(1) the kiln system already utilizes low-NOx burners in the kiln;
(2) the kiln system already utilizes cement kiln dust insufflation for NOx control;
(3) the department concurs with the finding of technical infeasibility for flue gas recirculation and selective catalytic reduction due to lack of commercial application for these technologies on the type of kiln system operated at Clarksville (long, wet);
(4) the department concurs that selective non-catalytic reduction (SNCR) and mid-kiln firing of tires are technically feasible (with some caveats regarding SNCR performance in a long, wet kiln system); and
(5) the cost effectiveness of the mid-kiln firing NOx control and the increased certainty of emission reduction supports its choice over SNCR in this specific case.

The evaluation for control of sulfur dioxide (SO_2) for the Clarksville kiln system included fuel substitution, raw material substitution, dry scrubbing, and wet scrubbing. The department concurs with your finding that fuel substitution and dry/wet scrubbing are technically feasible for SO_2 control. The department has some reservations with the scrubbing technology cost analysis used in your proposal. However, the department's analyses demonstrate the cost of scrubbing technology would significantly impact the Clarksville kiln's ability to compete in the cement production market (e.g. nearly $20/ton clinker produced). Therefore, the department has found

that switching to a lower sulfur fuel with the use of TDF will satisfy the SO_2 BART requirements for the Clarksville kiln system.

The enclosed draft consent agreement documents the department's findings for BART. The department has determined the emission limits in the agreement should be expressed as 30-day rolling averages to allow for operational variability in the kiln system and to remain consistent with the averaging time utilized by the Environmental Protection Agency's (EPA) presumptive BART findings for electric generating units. This draft agreement has not been shared with EPA Region VII staff and will undergo their review before signature to ensure it is "approvable" for inclusion in the regional haze State Implementation Plan.

There are two specific issues in the agreement for your technical review: (1) missing continuous emission monitor data substitution and (2) calibration/quality assurance of the emission monitoring system. These two provisions have been designed to encourage a discussion between Holcim and the department regarding these important monitoring issues.

Overall, Holcim's willingness to provide the necessary information to address the federal regional haze requirements has been encouraging. At this point, we look forward to finalizing the agreement and incorporating it into the regional haze State Implementation Plan. If you have questions about the emission limits or other technical details, please contact Jeffry D. Bennett with the department's Air Pollution Control Program at P.O. Box 176, Jefferson City, Missouri 65102 or by telephone at (573) 751-8406. If you have questions regarding the legal requirements of the agreement, please contact Sarah Callier with the department's Division of Environmental Quality at (573) 522-9911.

Sincerely,

AIR POLLUTION CONTROL PROGRAM

James L. Kavanaugh

James L. Kavanaugh
Director

JLK:jbt

Enclosure

c: Ms. Sarah Callier, Division of Environmental Quality, Legal Counsel

REGIONAL HAZE AGREEMENT

The parties hereto, the Missouri Department of Natural Resources and Holcim (US) Incorporated- Clarksville, having agreed that entry of this Regional Haze Agreement (hereinafter "Agreement") is in the best interest of the parties and the public health and the environment, hereby represent and state as follows:

JURISDICTION

1. The Missouri Department of Natural Resources (hereinafter "Department") is a duly authorized state agency created under Chapter 640 of the Revised Statutes of Missouri (as amended) to administer the programs assigned to it related to environmental control and the conservation and management of natural resources.

2. Chapter 643 of the Revised Statutes of Missouri (as amended) provides that the Director of the Department, on behalf of the Missouri Air Conservation Commission, administers the provisions of the Missouri Air Conservation Law.

3. Holcim (US) Incorporated- Clarksville (hereinafter "Holcim") is a Missouri corporation in good standing and registered to do business in Missouri in accordance with Missouri laws and is subject to the Missouri Air Conservation Law and the regulations adopted thereunder. Holcim is the legal and rightful owner of the facility listed in paragraph 17.

4. Pursuant to RSMo 643.060, the Director has authority and jurisdiction to issue this Agreement and to enforce the same. In any action by the Department to enforce the terms of this Agreement, Holcim agrees not to contest the authority or jurisdiction of the Director to issue this Agreement.

5. The terms of this Agreement shall be construed in accordance with the applicable laws of the state of Missouri and the United States.

STATEMENT OF PURPOSE

6. In entering into this Agreement, it is the mutual objective of the Department and Holcim to reduce the contributions of emissions from the facility, listed in paragraph 17, to regional haze at Mingo National Wildlife Refuge, Hercules Glade Wilderness Area, and Upper Buffalo Wilderness Area (in Arkansas), and to establish a schedule by which Holcim will achieve reductions in air pollution emissions of visibility impairing pollutants. This Agreement establishes enforceable emission limits pursuant to the Department's requirements to comply with the regional haze regulations identified in this Agreement which require the use of Best Available Retrofit Technology (BART) to applicable emission sources. This Agreement is not the result of any enforcement action or alleged non-compliance with any law, regulation, permit, or order and will enable Holcim

to timely comply with the Environmental Protection Agency (EPA) and the Department deadlines for BART and other unforeseen consequences.

PARTIES BOUND

7. This Agreement shall apply to and be binding upon the parties, their agents, successors, and assigns and upon all persons, contractors, and consultants acting under or for either the Department or Holcim or both.

8. The parties agree to undertake all actions required of them by the terms and conditions of this Agreement.

9. Notwithstanding the terms of any contract, Holcim is responsible for compliance with this Agreement and for insuring that its contractors and agents comply with this Agreement.

10. The activities conducted under this Agreement are subject to approval by the Department. Holcim shall make all reasonable efforts to provide all necessary information consistent with this Agreement requested by the Department.

LIABILITY

11. Nothing in this Agreement shall be considered an admission of any fact or acknowledgement of any liability by any party, nor shall anything in this Agreement be considered an admission of any fact or acknowledgement of any violation of any law, regulation, permit or order but will enable Holcim to timely comply with established EPA and Department deadlines for compliance with the regional haze regulations and other unforeseen requirements. Neither the State of Missouri nor any agency thereof shall be held out as a party of any contract entered into by Holcim in carrying out activities pursuant to this Agreement.

FINDINGS OF FACTS

12. In 1977, the U.S. Congress adopted §169 (42 U.S.C. 7491) of the Clean Air Act (CAA), setting forth the national visibility goal of restoring pristine conditions in national parks and wilderness areas designated as Class I Areas. When the CAA was again amended in 1990, Congress added §169B (42 U.S.C. 7492), authorizing further research and regular assessments of the progress made for visibility improvement.

13. EPA's Regional Haze Rule, 40 CFR 51.308 (Part P), was adopted July 1, 1999 and went into effect on August 30, 1999. The Regional Haze Rule aimed at achieving national visibility goals by 2064. This rulemaking addresses the combined visibility effects of various pollution sources over a wide geographic region. The 1999 Regional Haze Rule also singles out certain older emission sources that have not been regulated under other provisions of the CAA for

additional controls. Therefore, older sources that contribute to visibility impairment in Class I areas are required to implement BART.

14. On May 24, 2002, the U.S. Court of Appeals, D.C. District Court ruled on a challenge brought by the American Corn Growers Association against EPA's Regional Haze Rule of 1999. *American Corn Growers Association v. EPA*, 291 F.3d 1. The Court denied the American Corn Growers Association's challenge to the Regional Haze Rule and remanded the case to EPA. Pursuant to this remand, EPA proposed revisions to the Regional Haze Rule.

15. On July 6, 2005, EPA published a revision to the Regional Haze Rule, including Appendix Y, "Guidelines for BART Determinations Under the Regional Haze Rule," which provides direction to states on determining which older sources may need to install BART and how to determine BART.

16. Appendix Y of the Regional Haze Rule requires states to identify sources constructed between 1962 and 1977 in certain industrial categories, including portland cement production. Then, each state is allowed to consider whether the predicted (modeled) impact from each source's emissions on Class I areas has less than a significant contribution on visibility impairment (0.5 deciview). After both screening and refined air quality modeling evaluations for Missouri sources, Holcim was identified as a significant contributor to visibility impairment at Mingo Wildlife Refuge and Hercules Glade Wilderness Area in Missouri and Upper Buffalo Wilderness Area in Arkansas and was therefore required to install BART. The Department also determined that the magnitude of the direct Particulate Matter (PM) visibility impacts from Holcim at the relevant Class I areas were very minimal when compared to the overall impact. In addition, the controls already installed for direct PM emissions were evaluated and were determined to be sufficient to satisfy the BART requirements.

17. Based on these findings, the Department requested an evaluation of BART controls for Sulfur Dioxide (SO_{2}) and Oxides of Nitrogen (NO_{x}) emissions at Holcim. An initial BART proposal was submitted by Holcim on April 20, 2008. Comments were provided by the Department which resulted in three additional submittals to clarify information and explore additional control options. Subsequent comments were provided to ask for clarification of some additional options for BART. As a result, Holcim has now provided sufficient information for the Department's BART finding at the Clarksville facility for the kiln system (including the following emission point ID).

A. EP-14

18. The Department's BART finding is based on the use of mid-kiln firing of tires and reduced sulfur fuel sources (coal, tires, and synthetic fuel) to control NO_x and SO_2 respectively from kiln operation.

AGREEMENT AND COMPLIANCE PLAN

19. Holcim agrees to fire fuels containing less than three percent sulfur by weight at all times in the Clarksville kiln system.

20. Unless otherwise specified in the Agreement, Holcim agrees to meet the following emission limits for the kiln system as expeditiously as practicable, but no later than five years after approval of Missouri's regional haze plan:

   A. NO_x - 42,287 lb/day using a 30-day rolling average
   B. SO_2 - 58,787 lb/day using a 30-day rolling average

21. Compliance with the limits listed in paragraph 20 shall be based on the continuous emission monitoring (CEM) system employed as of the effective date of this Agreement or an equivalent system utilized by Holcim that has been approved by the Department. The methodology listed in subparagraphs A through D below shall be employed for the substitution of missing CEM data during periods of kiln operation for either NO_x or SO_2. For purposes of this Agreement, Kiln operation is defined as periods of time when the kiln is heated and rotation is occurring (NO_x emissions may occur when no fuel is being fired due to the residual heat in the kiln).

   A. 1-4 missing hours – the average of the hour preceding and the hour following the missing hours will be used;
   B. 5 – 24 missing hours – the maximum hourly emissions measured in the preceding month will be used for each missing hour;
   C. Over 24 missing hours up to 5 days – the maximum hourly emissions in the preceding three months will be used for each missing hour;
   D. Over 5 missing days – the maximum hourly emissions in the preceding 12 months will be used for each missing hour.

22. The continuous emission monitoring system shall be calibrated quarterly for SO_2 and NO_x emission measurement in accordance with an approved Quality Assurance Project Plan (QAPP) to be submitted no later than 90 days after the effective date of this Agreement. The QAPP shall address collection of all necessary parameters to calculate SO_2 and NO_x emissions, including flow-rate and concentration of the pollutants in the exit stream (measured in parts per million).

23. The emission limits in this Agreement shall be incorporated into any construction or operation permits issued for Holcim – Clarksville.

24. This Agreement shall be proposed by the Department for incorporation into the Regional Haze State Implementation Plan for Missouri.

CONCLUSIONS OF LAW

25. Holcim is a person within the meaning of RSMo 643.020.

26. RSMo 643.060.4 provides that the Director of the Missouri Department of Natural Resources is responsible for administering and enforcing the Missouri Air Conservation Law, investigating complaints, issuing orders and taking all actions necessary to implement the Missouri Air Conservation Law. RSMO 643.060.2 provides that the Director is authorized to enter into contracts as he deems necessary for carrying out the provisions of the Missouri Air Conservation Law. In addition, the Missouri Air Conservation Commission is granted the legal authority under RSMo 643.050 to develop and implement regulations and enter into agreements to control air pollution.

BEST PROFESSIONAL JUDGMENT

27. The requirements of this Agreement represent the best professional judgment of the Department based on information available as of the effective date of this Agreement. If circumstances change significantly so that data related to the commitments of this Agreement indicates an imminent threat of danger to the public health, safety or the environment or if the Department determines there is a significantly different threat other than the issues addressed herein, then the Department reserves the right to modify dates or requirements herein as it deems reasonably necessary to comply with the regional haze regulations, provided that the Department gives Holcim at least 90 days notice and an opportunity to submit a compliance schedule after the 90 day notice period. Holcim further reserves the right to appeal any such modifications or additional requirements in accordance with paragraph 30.

FORCE, MAJEURE, EXCUSABLE DELAY, MODIFICATION

28. The following shall constitute the governing terms for force majeure, excusable delay, and modification of the Agreement:

   A. Holcim shall perform the requirements under this Agreement within the time limits set forth herein unless the performance is prevented or delayed solely by events which constitute a force majeure. For purposes of this Agreement a force majeure is defined as any event beyond the control of Holcim which could not be overcome by due diligence and which delays or prevents performance by a date required by this Agreement. Such events do not include increased costs of performance or changed economic circumstances. Any delay caused in whole or in part by action or inaction by municipal, state, or federal regulatory authorities or third parties unrelated to Holcim shall be considered a force majeure and shall not be deemed a violation of any obligation required by this Agreement.

B. Holcim shall have the burden of proving claims of force majeure. Failure to comply by reason of force majeure shall not be construed as a violation of this Agreement.

C. Holcim shall notify the Department in writing within ten (10) days after becoming aware of an event which Holcim knew or reasonably should have known constituted force majeure. Such notice shall estimate the anticipated length of delay, its cause, measures to be taken to minimize the delay, and an estimated timetable for implementation of these measures. Failure to comply with the notice provision of this section may constitute a waiver of Holcim's right to assert a force majeure claim and may be grounds for the Department, at its sole discretion, to deny Holcim an extension of time for performance.

D. Within ten (10) days of the receipt of written notice from Holcim of a force majeure event, the Department shall notify Holcim of the extent to which modifications to this Agreement are necessary. In the event that the Department and Holcim cannot agree that a force majeure event has occurred or if there is no agreement on the length of the extension, the dispute shall be resolved as set forth in paragraph 30.

E. Any modifications to any provision of this Agreement shall not alter the schedule for performance or completion of other tasks required by this Agreement, unless specifically agreed to by the parties in writing and incorporated into this Agreement.

F. This Agreement may be amended by mutual agreement of the Department and Holcim. Such amendments shall be in writing, shall have as their effective date the date on which they are signed by both parties and shall be incorporated into this Agreement.

DISPUTE RESOLUTION

29. The parties recognize that a dispute may arise between them regarding implementation of the action to be taken as herein set forth or other terms or provisions of this Agreement.

A. If such dispute arises, the parties will endeavor to settle it by informal negotiations between themselves. If the parties cannot resolve the issue informally within a reasonable period of time, either of the parties may notify the other in writing stating its position with regard to the dispute and the reasons therefore. A party receiving such a notice of dispute will respond in writing within ten (10) days stating its position. The Department or Holcim shall then have an additional ten (10) day period or such longer time as the parties agree to respond. If the parties are still unable to reach an agreement, the matter shall be referred to the Director

of the Division of Environmental Quality, who shall decide the matter and provide a written statement of his decision which shall be incorporated into the Agreement

B. This dispute resolution procedure shall not preclude any party from having direct recourse to court if otherwise available Missouri law.

OTHER CLAIMS AND PARTIES

30. Nothing in this Agreement shall constitute or be construed as a release for any claim, cause of action or demand in law or equity against any person, firm, partnership, or corporation not a signatory to this Agreement for any liability it may have arising out of or relating in any way to this Agreement.

EFFECTIVE DATE, TERMINATION

31. This Agreement shall become effective when signed by the Director of the Missouri Department of Natural Resources or his designee.

32. This Agreement will be terminated at such time that it is superseded by a future agreement, regulation, or other enforceable document that contains equivalent or more stringent emission limits. The Department will provide written notice to Holcim of said termination. Such notice shall not be unreasonably withheld.

AUTHORIZATION OF SIGNATORIES TO EXECUTE THE AGREEMENT AND BIND THE PARTIES

33. The parties hereto have affixed their signatures on the dates inserted below to acknowledge their agreement to this Agreement. The signatories to this Agreement certify that they are authorized to execute and to legally bind the parties they represent to this Agreement.

Appendix S

Holcim-Clarksville BART Final Consent Agreement

April 19, 2009

REGIONAL HAZE AGREEMENT

The parties hereto, the Missouri Department of Natural Resources and Holcim (US) Inc. ("Holcim"), having agreed that entry of this Regional Haze Agreement (hereinafter "Agreement") is in the best interest of the parties and the public health and the environment, hereby represent and state as follows:

JURISDICTION

1. The Missouri Department of Natural Resources (hereinafter "Department") is a duly authorized state agency created under Chapter 640 of the Revised Statutes of Missouri (as amended) to administer the programs assigned to it related to environmental control and the conservation and management of natural resources.

2. Chapter 643 of the Revised Statutes of Missouri (as amended) provides that the Director of the Department, on behalf of the Missouri Air Conservation Commission, administers the provisions of the Missouri Air Conservation Law.

3. Holcim is a Delaware corporation in good standing and registered to do business in Missouri in accordance with Missouri laws and is subject to the Missouri Air Conservation Law and the regulations adopted thereunder. Holcim owns and operates a portland cement manufacturing facility located in Clarksville, Pike County, Missouri ("Clarksville Plant"). Holcim is a person within the meaning of RSMo 643.020.

4. Pursuant to RSMo 643.060, the Director has authority and jurisdiction to issue this Agreement and to enforce the same. In any action by the Department to enforce the terms of this Agreement, Holcim agrees not to contest the authority or jurisdiction of the Director to enter into and enforce this Agreement. RSMo 643.060.4 provides that the Director of the Missouri Department of Natural Resources is responsible for administering and enforcing the Missouri Air Conservation Law, investigating complaints, issuing orders and taking all actions necessary to implement the Missouri Air Conservation Law. RSMo 643.060.2 provides that the Director is authorized to enter into contracts as he deems necessary for carrying out the provisions of the Missouri Air Conservation Law. In addition, the Missouri Air Conservation Commission is granted the legal authority under RSMo 643.050 to develop and implement regulations and enter into agreements to control air pollution.

5. The terms of this Agreement shall be construed in accordance with the applicable laws of the state of Missouri and the United States.

STATEMENT OF PURPOSE

6. In entering into this Agreement, it is the mutual objective of the Department and Holcim to reduce the contributions of emissions from the Clarksville Plant to

regional haze at Mingo National Wildlife Refuge, Hercules Glade Wilderness Area, and Upper Buffalo Wilderness Area (in Arkansas), and to establish a schedule by which Holcim will achieve reductions in air pollution emissions of visibility impairing pollutants. This Agreement establishes enforceable emission limits for Emission Point EP-14 (main kiln stack) pursuant to the Department's requirements to comply with the regional haze regulations identified in this Agreement which require the use of Best Available Retrofit Technology (BART) to applicable emission sources. This Agreement is not the result of any enforcement action or alleged non-compliance with any law, regulation, permit, or order and will enable Holcim to timely comply with the United States Environmental Protection Agency (EPA) and the Department deadlines for BART.

PARTIES BOUND

7. This Agreement shall apply to and be binding upon the parties, their agents, successors, and assigns and upon all persons, contractors, and consultants acting under or for either the Department or Holcim or both. Any changes in ownership or corporate status, including but not limited to any transfer of assets or real or personal property (other than as set forth in the next sentence), shall not affect the responsibilities of Holcim under this Agreement. If Holcim sells or otherwise transfers the Clarksville Plant, Holcim shall cause as a condition of such sale, the buyer of the Clarksville Plant to assume the obligations of Holcim under this Agreement in writing upon which Holcim shall be relieved of its obligations under the Agreement. In such event, Holcim shall provide thirty (30) days prior written notice of such assumption to the Department.

8. The parties agree to undertake all actions required of them by the terms and conditions of this Agreement.

9. Notwithstanding the terms of any contract, Holcim is responsible for its compliance with this Agreement and for insuring that its contractors and agents comply with this Agreement.

10. The activities conducted under this Agreement are subject to oversight and approval by the Department as provided in this Agreement and other sources of law. Holcim shall make all reasonable efforts to provide all necessary information consistent with this Agreement requested by the Department.

LIABILITY

11. Nothing in this Agreement shall be considered an admission of any fact or acknowledgement of any liability by any party, nor shall anything in this Agreement be considered an admission of any fact or acknowledgement of any violation of any law, regulation, permit or order but will enable Holcim to timely comply with established EPA and Department deadlines for compliance with the regional haze

regulations and requirements. Neither the State of Missouri nor any agency thereof shall be held out as a party to any contract entered into by Holcim in carrying out activities pursuant to this Agreement.

BACKGROUND

12. In 1977, the U.S. Congress adopted § 169 (42 U.S.C. 7491) of the Clean Air Act (CAA), setting forth the national visibility goal of restoring pristine conditions in national parks and wilderness areas designated as Class I Areas. When the CAA was again amended in 1990, Congress added § 169B (42 U.S.C. 7492), authorizing further research and regular assessments of the progress made for visibility improvement.

13. EPA's Regional Haze Rule, 40 CFR 51.308 (Part P), was adopted July 1, 1999 and went into effect on August 30, 1999. The Regional Haze Rule aimed at achieving national visibility goals by 2064. This rulemaking addresses the combined visibility effects of various pollution sources over a wide geographic region. The 1999 Regional Haze Rule also singles out certain older emission sources that have not been regulated under other provisions of the CAA for additional controls. Therefore, older sources that contribute to visibility impairment in Class I areas are required to implement BART.

14. On May 24, 2002, the U.S. Court of Appeals, D.C. District Court ruled on a challenge brought by the American Corn Growers Association against EPA's Regional Haze Rule of 1999. *American Corn Growers Association v. EPA*, 291 F.3d 1. The Court denied the American Corn Growers Association's challenge to the Regional Haze Rule and remanded the case to EPA. Pursuant to this remand, EPA proposed revisions to the Regional Haze Rule.

15. On July 6, 2005, EPA published a revision to the Regional Haze Rule, including Appendix Y, "Guidelines for BART Determinations Under the Regional Haze Rule," which provides direction to states on determining which older sources may need to install BART and how to determine BART.

16. Appendix Y of the Regional Haze Rule requires states to identify sources constructed between 1962 and 1977 in certain industrial categories, including Portland cement production. Then, each state is allowed to consider whether the predicted (modeled) impact from each source's emissions on Class I areas has less than a significant contribution on visibility impairment (0.5 deciview). After both screening and refined air quality modeling evaluations for Missouri sources, Holcim was identified as a contributor to visibility impairment at Mingo Wildlife Refuge and Hercules Glade Wilderness Area in Missouri and Upper Buffalo Wilderness Area in Arkansas due to its Sulfur Dioxide (SO_2) and Oxides of Nitrogen (NO_x) emissions and is therefore required to install BART. The Department also determined that the magnitude of the direct Particulate Matter (PM) visibility impacts from Holcim at the relevant Class I areas was very minimal. In addition, the controls already installed

for direct PM emissions were evaluated and were determined to be sufficient to satisfy the BART requirements.

17. Based on these findings, the Department requested an evaluation of BART controls for SO_2 and NO_x emissions at Holcim. An initial BART proposal was submitted by Holcim on April 20, 2008. Comments were provided by the Department which resulted in three additional submittals to clarify information and explore additional control options. Subsequent comments were provided to ask for clarification of some additional options for BART. As a result, Holcim provided sufficient information for the Department's BART finding at the Clarksville Plant for the kiln system: EP-14 (main kiln stack)

18. The Department's BART finding is based on the use of mid-kiln firing of tires and reduced sulfur fuel sources (coal, tires, and synthetic fuel) to control NO_x and SO_2 respectively from kiln operation.

AGREEMENT AND COMPLIANCE PLAN

Subject to the terms and conditions contained herein, the parties agree as follows:

19. This Agreement applies only to operation of the Clarksville Plant kiln system (Emission Point ID EP-14 main kiln stack). Unless otherwise specified in the Agreement, Holcim agrees to meet the following emission limits for the kiln system as expeditiously as practicable after approval of Missouri's regional haze plan, but no later than four years after approval of Missouri's regional haze plan:

    A. NO_x – 42,287 lb/day using a 30-day rolling average
    B. SO_2 – 58,787 lb/day using a 30-day rolling average

20. Compliance with the limits listed in paragraph 19 shall be based on the existing continuous emission monitoring (CEM) system or an equivalent system utilized by Holcim that has been approved by the Department at all times when (a) fuel is being combusted in the kiln or (b) the kiln shell temperature exceeds 200°F and kiln rotation is occurring. When the circumstances described in (a) and (b) above are not present, no CEM data is required. Holcim shall be subject to the above listed monitoring requirements upon the EPA's approval of Missouri's regional haze plan.

    Except for routine CEMS calibration and maintenance activities, missing data due to CEMS availability will be filled by using the following methods:

    If the monitor data availability is at least 90.0% over the preceding 30 day rolling average, the owner or operator shall calculate substitute data for each hour of each missing data period according to the following procedure:

    (I) For a missing data period of less than or equal to 24 hours, substitute the average of the hourly concentrations recorded by a pollutant concentration monitor for the hour before and the hour after the missing data period.

(II) For the missing data period of more than 24 hours, substitute the greater of:
(a) The 95th percentile hourly pollutant concentration recorded by a pollutant concentration monitor during the previous 720 quality-assured monitor operating hours; or
(b) The average of the hourly concentrations recorded by a pollutant concentration monitor for the hour before and the hour after the missing data period.

If the monitor data availability is less than 90.0% for the previous thirty (30) day rolling average, the following substitution or another alternative method agreed to by the Department will be utilized:

SO_2 – 3,355 pounds per hour for each missing hour, and
NO_X – 2,202 pounds per hour for each missing hour.

For routine CEMS calibration and maintenance activities, missing emission data will be substituted using the average of the hour before and the hour after the activity.

21. As identified in item 20, Holcim shall calibrate and comply with the continuous emission monitoring system applicable requirements per 40 CFR, Part 60, Appendix F, Quality Assurance Procedure 1 or other equivalent procedure approved by the Department. At the request of the Department, Holcim will provide results of any audits and RATAs. Holcim will be subject to the above calibration and quality assurance requirements upon the EPA's approval of Missouri's regional haze plan.

22. As identified in paragraph 20, Holcim shall record the hourly CEM data or data supporting lack of kiln operation to demonstrate compliance with the limits in paragraph 19. Holcim shall maintain these records for a period of no less than five years. These records shall be kept at the Clarksville Plant; however, they may be maintained at a subsequent site provided that Holcim notifies the Department in writing thirty (30) days before any records are moved and provides the department with the address of the site where the records will be maintained and the name of a contact person in the event the Department needs to inquire as to the records. Holcim shall submit an annual report to the Department detailing the daily and 30-day rolling average emission SO2 and NOx emission rates. The first annual report will be due one year and 60 days after EPA's approval of Missouri's regional haze plan. Subsequent reports will be due on this same date each year.

23. The emission limits in this Agreement shall be incorporated into any construction or operation permits issued for Holcim at the Clarksville Plant.

24. This Agreement shall be proposed by the Department for incorporation into the Regional Haze State Implementation Plan for Missouri.

BEST PROFESSIONAL JUDGMENT

25. The requirements of this Agreement represent the best professional judgment of the Department based on information available as of the effective date of this Agreement. If circumstances change significantly so that data related to the commitments of this Agreement indicates an imminent threat of danger to the public health, safety or the environment or if the Department determines there is a significantly different threat other than the issues addressed herein, then the Department reserves the right to modify dates or requirements herein as it deems reasonably necessary to comply with the regional haze regulations, provided that the Department gives Holcim at least 90 days notice and an opportunity to propose a compliance schedule during the 90 days notice period. Holcim further reserves the right to seek review of any such modifications or additional requirements in accordance with paragraph 27.

FORCE, MAJEURE, EXCUSABLE DELAY, MODIFICATION

26. The following shall constitute the governing terms for force majeure, excusable delay, and modification of the Agreement:

A. Except as set forth in paragraph G. below, Holcim shall perform the requirements under this Agreement within the time limits set forth herein unless the performance is prevented or delayed solely by events which constitute a force majeure. For purposes of this Agreement a force majeure is defined as any event beyond the control of Holcim which could not be overcome by due diligence and which delays or prevents performance by a date required by this Agreement. Such events do not include increased costs of performance or changed economic circumstances.

B. Holcim shall have the burden of proving all claims of force majeure. Failure to comply by reason of force majeure shall not be construed as a violation of this Agreement.

C. Holcim shall notify the Department in writing within ten (10) days after becoming aware of an event which Holcim knew or reasonably should have known constituted force majeure. Such notice shall estimate the anticipated length of delay, its cause, measures to be taken to minimize the delay, and an estimated timetable for implementation of these measures. Failure to comply with the notice provision of this section shall constitute grounds for the Department, at its sole discretion, to deny Holcim an extension of time for performance.

D. Within sixty (60) days of the receipt of written notice from Holcim of a force majeure event, the Department shall notify Holcim of the extent to which

modifications to this Agreement are necessary. In the event that the Department and Holcim cannot agree that a force majeure event has occurred or if there is no agreement on the length of the extension, the dispute shall be resolved as set forth in paragraph 27.

E. Any modifications to any provision of this Agreement shall not alter the schedule for performance or completion of other tasks required by this Agreement, unless specifically agreed to by the parties in writing and incorporated into this Agreement.

F. This Agreement may be amended by mutual agreement of the Department and Holcim. Such amendments shall be in writing, shall have as their effective date the date on which they are signed by both parties and shall be incorporated into this Agreement.

G. Holcim, voluntarily and of its own accord and for reasons unrelated to this Agreement has indicated in November 2008 that it will cease clinker production at the Clarksville Plant during the first quarter of 2009. Upon permanent cessation of operation of the Clarksville Plant kiln, Holcim at its election may formalize such permanent cessation of the kiln in a letter to the Department's Director of the Division of Environmental Quality in which it may agree that any operating permits and construction permits issued by the Air Pollution Control Program for the kiln system shall be terminated. In the event that Holcim sends the letter and agrees to the termination of such permits, this Agreement shall be null and void and of no further force and effect, except that Holcim shall submit any compliance reports required to be submitted hereunder up to the date of such termination.

DISPUTE RESOLUTION

27. The parties recognize that a dispute may arise between them regarding implementation of the action to be taken as herein set forth or other terms or provisions of this Agreement.

A. If such dispute arises, the parties will endeavor to settle it by informal negotiations between themselves. If the parties cannot resolve the issue informally within a reasonable period of time, either of the parties may commence a non-contested case by notifying the other in writing stating its position with regard to the dispute and its rationale. A party receiving such a notice of dispute will respond in writing within thirty (30) days stating its position. The Department or Holcim shall then have an additional thirty (30) day period or such longer time as the parties agree to respond. If the parties are still unable to reach an agreement, the matter shall be referred to the Department's Director of the Division of Environmental Quality, who shall

decide the matter and provide a written statement of his decision which shall be incorporated into the Agreement.

B. This dispute resolution procedure shall not preclude any party from having direct recourse to court if otherwise available under Missouri law.

OTHER CLAIMS AND PARTIES

28. Nothing in this Agreement shall constitute or be construed as a release for any claim, cause of action or demand in law or equity against any person, firm, partnership, or corporation not a signatory to this Agreement for any liability it may have arising out of or relating in any way to this Agreement.

EFFECTIVE DATE, TERMINATION

29. This Agreement shall become effective when signed by the Director of the Missouri Department of Natural Resources or his designee.

30. Except as expressly set forth in paragraph 26.G., this Agreement will be terminated at such time that it is superseded by a future agreement, regulation, or other enforceable document that contains equivalent or more stringent emission limits.

AUTHORIZATION OF SIGNATORIES TO EXECUTE THE AGREEMENT AND BIND THE PARTIES

31. The parties hereto have affixed their signatures on the dates inserted below to acknowledge their agreement to this Agreement. The signatories to this Agreement certify that they are authorized to execute and to legally bind the parties they represent to this Agreement.

TABLE OF CONTENTS

Abbreviations and Acronyms

BACT - Best Available Control Technology

BART - Best Available Retrofit Technology

CAA - Clean Air Act

CAIR - Clean Air Interstate Rule

CFR - Code of Federal Regulations

dv - Deciviews

EPA - Environmental Protection Agency

FLM - Federal Land Manager

FR - Federal Register

NOx - A mixture of nitrogen dioxide (NO_2), nitric oxide (NO), and other nitrogen oxide gases

NAAQS - National Ambient Air Quality Standard

OAQPS - Office of Air Quality Planning and Standards

$PM_{2.5}$ - Particulate Matter of 2.5 microns or less in size

RHR - Regional Haze Rule

RPG - Reasonable Progress Goal

RPO - Regional Planning Organization

SIP - State Implementation Plan

yr - Year

1.0 INTRODUCTION

The purpose of this document is to provide guidance to States in setting reasonable progress goals (RPGs) as part of their regional haze state implementation plans (SIPs) and in deciding those measures necessary to meet these goals. We emphasize that this document is merely guidance and that States or the Environmental Protection Agency (EPA) may elect to follow or deviate from this guidance, as appropriate. The ultimate determination of whether a given SIP submission by a State meets the statutory requirements of sections 169A and 169B of the Clean Air Act (CAA) and the regional haze regulations at 40 CFR 51.300 - 309 will be accomplished through notice and comment rulemaking in which the facts and circumstances of each State submission will be evaluated by EPA.

Under the Tribal Authority Rule, 40 CFR part 49, Tribes have the authority to seek "treatment as a State" for purposes of administering certain CAA programs, including the regional haze program. Whether Tribes seek this authority or not, EPA encourages Tribes to participate in the regional planning efforts to address visibility and to consult with neighboring States as they develop their regional haze SIPs. We hope that this guidance will provide Tribes with an understanding of the process for establishing RPGs that will assist them in the consultation process.

1.1 Legislative and Regulatory History

The CAA was amended in August 1977, and a new section 169A was added for the protection of visibility in mandatory class I Federal areas (Class I areas) of great scenic importance. In section 169A(a)(1), Congress established the national goal for visibility protection:

> *Congress hereby declares as a national goal the prevention of any future, and the remedying of any existing, impairment of visibility in mandatory class I Federal areas which impairment results from manmade air pollution.*

Section 169A(a)(4), in part, requires EPA to "promulgate regulations to assure reasonable progress toward meeting the national goal." The CAA also requires States to submit SIPs containing such emission limits, schedules of compliance, and other measures as may be necessary to make reasonable progress toward meeting the goal.[1]

[1] CAA §169A(b)(2).

In the CAA Amendments of 1990, Congress added section 169B to strengthen and reaffirm the national goal. Section169B(e) calls for EPA to "carry out the Administrator's regulatory responsibilities under [section 169A], including criteria for measuring 'reasonable progress' toward the national goal."

In response to these mandates, EPA promulgated the regional haze rule (RHR) on July 1, 1999.[2] Under section 51.308(d)(1) of this rule, States must "establish goals (expressed in deciviews) that provide for reasonable progress towards achieving natural visibility conditions" for each Class I area within a State. These RPGs must provide for an improvement in visibility for the most impaired days over the period of the implementation plan and ensure no degradation in visibility for the least impaired days over the same period.[3]

The RHR also requires States to submit a long-term strategy that includes such measures as are necessary to achieve the RPG for each Class I area.[4] The regulations require States to consider major and minor stationary sources, mobile sources, and area sources in developing their long-term strategies. In addition, States must submit a SIP that contains either emission limitations representing best available retrofit technology (BART) for certain sources put into operation between 1962 and 1977 *or* alternative measures that provide for greater reasonable progress than BART.[5] The BART requirements were addressed in a rule revising certain provisions of the regulations in section 51.308(e) and promulgating the BART Guidelines.[6]

1.2 Meaning of the Term "Reasonable Progress Goal"

States must establish RPGs, measured in deciviews (dv), for each Class I area for the purpose of improving visibility on the haziest days and ensuring no degradation in visibility on the clearest days over the period of each implementation plan.[7] RPGs are interim goals that represent incremental visibility improvement over time toward the goal of natural background conditions and are developed in consultation with other affected States and Federal Land

[7] 40 CFR 51.308(d)(1).

Managers (FLM).[8]

In determining what would constitute reasonable progress, section 169A(g) of the CAA requires States to consider the following four factors:

- The costs of compliance;
- The time necessary for compliance;
- The energy and non-air quality environmental impacts of compliance; and
- The remaining useful life of existing sources that contribute to visibility impairment.[9]

States must demonstrate in their SIPs how these factors are taken into consideration in selecting the RPG for each Class I area in the State.

The discussion of the statutory factors in this guidance is largely aimed at helping States apply these factors in considering measures for point sources. States may find that the factors can be applied to sources other than point sources; the meaning of the factors, however, should not be unduly strained in order to fit non-point sources. In other words, if common sense dictates that a particular statutory factor cannot be applied to a particular source category, then the State's analysis may reflect that fact, and emissions reductions from such sources may still be included in the SIP.

As noted above, the RHR establishes an additional analytical requirement for States in the process of establishing the RPG. This analytical requirement requires States to determine the rate of improvement in visibility needed to reach natural conditions by 2064, and to set each RPG taking this "glidepath" into account.[10] (The process for determining the glidepath is discussed later in this document.) EPA adopted this approach, in part, to ensure that States use a common analytical framework that accounts for the regional differences affecting visibility and, in part, to ensure an informed and equitable decision making process. The glidepath is not a presumptive target, and States may establish a RPG that provides for greater, lesser, or equivalent visibility improvement as that described by the glidepath.

---

[8] 40 CFR 51.308(d)(1)(iv) and 51.308(i).

[9] CAA §169A(g)(1); 40 CFR 51.308(d)(1)(i)(A).

[10] 40 CFR 51.308(d)(1)(i)(B).

In deciding what amount of emissions reduction is appropriate in setting the RPG, you should take into account the fact that the long-term goal of no manmade impairment encompasses several planning periods. It is reasonable for you to defer reductions to later planning periods in order to maintain a consistent glidepath toward the long-term goal.

1.3 Relationship of Reasonable Progress to BART and the Long-Term Strategy

The RPGs, the long-term strategy, and BART (or alternative measures in lieu of BART) are the three main elements of the regional haze SIPs that States are required to submit by December 17, 2007. The long-term strategy and BART emissions limitations or other alternative measures, including cap-and-trade programs or other economic incentive approaches, are inherently related to the RPG. The long-term strategy is the compilation of "enforceable emissions limitations, compliance schedules, and other measures as necessary to achieve the [RPGs],"[11] and is the means through which the State ensures that its RPG will be met. BART emissions limits (or alternative measures in lieu of BART, such as the Clean Air Interstate Rule (CAIR)) are one set of measures that must be included in the SIP to ensure that an area makes reasonable progress toward the national goal, and the visibility improvement resulting from BART (or a BART alternative) is included in the development of the RPG.

[11] 40 CFR 51.308(d)(3),

2.0 OVERVIEW OF THE PROCESS FOR DEVELOPING THE RPG

Development of the RPG for each Class I area should be a collaborative process among State, local, and Tribal authorities, Regional Planning Organizations (RPOs), and FLMs. Steps for developing RPGs will be briefly outlined in this section of the guidance, along with references to other guidance and rules where additional detail can be found. The remaining sections of this guidance expand on particular aspects of these steps. In addition, as this is guidance for States in developing RPGs, the use of "you" through the rest of the document refers to States.

2.1 Establish Baseline and Natural Visibility Conditions

To track progress toward the national goal, the RHR, among other things, requires you to establish the "baseline conditions" representing visibility for the best and worst days at the time the regional haze program is established for each Class I area. Once established, the baseline represents the starting point from which reasonable progress will be measured. The RHR also requires you to estimate "natural conditions" for each Class I area that represents the visiblity conditions that would exist in the absence of man-made impairment.

As explained in the RHR, the baseline for each Class I area is the average visibility (in dv) for the 20 percent most impaired days, or "worst days", and for the 20 percent least impaired days, or "best days," for the years 2000 through 2004.[12] Using available monitoring data for the 2000 to 2004 time period, you are required to calculate the baseline by averaging the annual values (in dv) for the 20 percent worst days in each year (yr) to produce a single value (in dv) that represents the baseline conditions for the worst days. You should follow the same approach for determining the value that represents the baseline conditions for the best days. Natural conditions at each Class I area are also expressed by reference to the level of visibility (in dv) for the 20 percent most impaired and least impaired days.[13]

[12] 64 FR at 35730.

[13] For more detail on determining baseline and natural conditions, you can review the preamble and regulations in the RHR, 64 FR at 35728 – 35730, 40 CFR 51.308(d)(2), EPA's *Guidance for Tracking Progress Under the Regional Haze Rule*, EPA-454/B-03-004 (September 2003) available at www.epa.gov/ttn/oarpg/t1/memoranda/rh_tpurhr_gd.pdf, and EPA's *Guidance for Estimating Natural Visibility Conditions Under the Regional Haze Rule*, EPA-454/B-03-005 (September 2003) available at www.epa.gov/ttn/oarpg/t1/memoranda/rh_envcurhr_gd.pdf.

2.2 Determine the Glidepath, or Uniform Rate of Progress

By comparing baseline conditions with natural conditions, you can determine the uniform rate of visibility improvement, or progress, needed to reach natural conditions by 2064 for each Class I area. Figure 1, below, illustrates the basic steps in the process for calculating the uniform rate of progress toward natural conditions for the first planning period at a hypothetical Class I area.

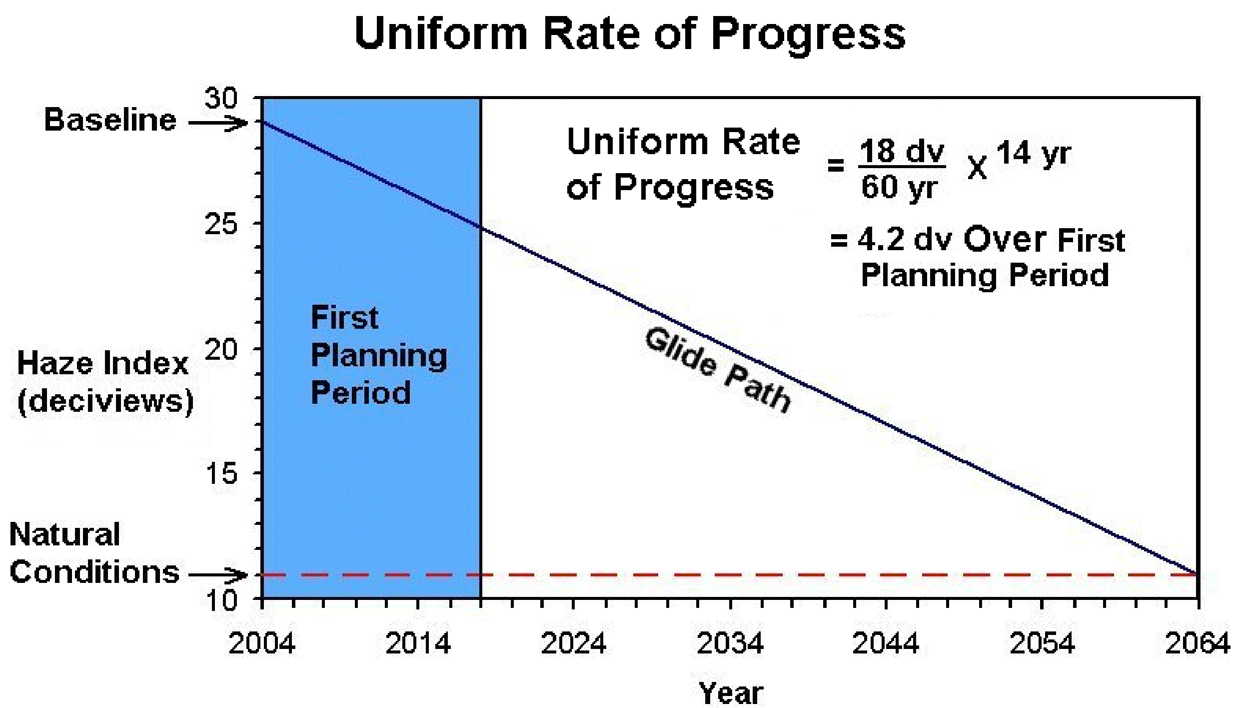

Figure 1

Figure 1 Example of a Uniform Rate of Progress

- Compare baseline conditions to natural conditions. The difference between these two represents the amount of progress needed to reach natural visibility conditions. In this example, the State has determined that the baseline for the 20 percent worst days for the Class I area is 29 dv and estimated that natural background is 11 dv, a difference of 18 dv.

- Calculate the annual average visibility improvement needed to reach natural conditions by 2064 by dividing the total amount of improvement needed by 60 years (the period between 2004 and 2064). In this example, this value is 0.3 dv/yr.

- Multiply the annual average visibility improvement needed by the number of years in the first planning period (the period from 2004 until 2018). In this example, this value is 4.2 dv. This is the uniform rate of progress that would be needed during the first planning period to attain natural visibility conditions by 2064.

If you were to achieve this steady improvement in visibility over the next 60 years, you would reach the national goal by 2064.

2.3 Identify and Analyze the Measures Aimed at Achieving the Uniform Rate of Progress.

The next step in setting an RPG is to identify and analyze the measures aimed at achieving the uniform rate of progress and to determine whether these measures are reasonable based on the statutory factors identified in Section 1.2 above. To meet this requirement, we suggest the following approach which ensures that States consider all reasonable measures in developing their regional haze SIPs:

- Identify the key pollutants and sources and/or source categories that are contributing to visibility impairment at each Class I area. The sources of impairment for the most impaired and least impaired days may differ. Section 3 discusses this process.

- Identify the control measures and associated emission reductions that are expected to result from compliance with existing rules *and* other available measures for the sources and source categories that contribute significantly to visibility impairment. This is covered in more detail in Section 4.

- Determine what additional control measures would be reasonable based on the statutory factors and other relevant factors for the sources and/or source categories you have identified.

- Estimate through the use of air quality models the improvement in visibility that would result from implementation of the control measures you have found to be reasonable and compare this to the uniform rate of progress.

Another possible approach that some States and RPOs are using is to "back out" the measures necessary to achieve the uniform rate of progress. In this process, States are using dispersion modeling to estimate the visibility impacts of a specific percentage reduction in visibility impairing pollutants. The resulting visibility conditions are then compared to the uniform rate of progress. Using this process, States will be able to identify a percentage

reduction in visibility impairing pollutants that would provide progress at or beyond the uniform rate of progress. In a separate step, States would consider the statutory factors along with other relevant factors to select appropriate measures to achieve the identified reduction in emissions. States can thus identify the measures that would be needed to achieve the uniform rate of progress at a Class I area and determine whether such measures are reasonable.

2.4 Establish a RPG

In developing a RPG, you must consult with other States with emissions sources that may reasonably be anticipated to cause or contribute to visibility impairment at Class I areas in your State.[14] The regulations anticipate that States may not always agree on what measures would be reasonable or on the appropriateness of a RPG. We encourage States to work together early and often to resolve such issues. In addition, the FLMs may provide insight and assistance to States in identifying regional approaches to address the RPG.

The improvement in visibility resulting from implementation of the measures you have found to be reasonable, considering the uniform rate of progress, is the amount of progress that represents your RPG. The regional haze rule requires you to clearly support your RPG determination in your SIP submission based on the statutory factors. [15]

[14] 40 CFR 51.308(d)(1)(iv).

[15] 40 CFR 51.308(d)(1)(i)(A).

3.0 IDENTIFYING KEY POLLUTANTS AND SOURCE CATEGORIES FOR THE FIRST PLANNING PERIOD

This process begins with the identification of key pollutants and source categories that contribute to visibility impairment at the Class I area. Such analysis has been the subject of considerable study over the past decade, including studies by the Grand Canyon Visibility Transport Commission and ongoing work by RPOs. For the purpose of this document, it is assumed that analyses identifying the key pollutants contributing to visibility impairment have been conducted for each Class I area.

3.1 Identification of Source Categories From Which These Pollutants and Their Precursors Are Emitted

Once the key pollutants contributing to visibility impairment at each Class I area have been identified, the sources or source categories responsible for emitting these pollutants or pollutant precursors can also be determined. There are several tools and techniques being employed by the RPOs to do so, including analysis of emission inventories, source apportionment, trajectory analysis, and atmospheric modeling. Technical guidance on these tools and techniques is beyond the scope of this document. Instead, this document focuses on policy considerations relevant to the identification of which source categories should be considered as part of the regional haze SIP development process.

When identifying the sources or source categories responsible for regional haze, you should consider the relationship between the RPG and the requirements for long-term strategies. The regulations require States to consider major and minor stationary sources, as well as mobile and area sources, in developing long-term strategies.[16] At a minimum, the regulations require you to consider several factors when developing a long-term strategy, including the following:

- Emissions reductions due to ongoing air pollution control programs, including measures to address reasonably attributable visibility impairment and those taken to attain the fine particulate matter ($PM_{2.5}$) national ambient air quality standards (NAAQS).
- Measures to mitigate the impact of construction activities.
- Smoke management techniques for agricultural and forestry management purposes.

[16] 40 CFR 51.308(d)(3)(iv).

- Anticipated visibility effects from changes in point, area, and mobile source emissions.[17]

As illustrated by these factors, States should consider a broad array of sources and activities when deciding which sources or source categories contribute significantly to visibility impairment.

[17] 40 CFR 51.308(d)(3)(v).

4.0 IDENTIFY CONTROL MEASURES FOR CONTRIBUTING SOURCE CATEGORIES FOR THE FIRST PLANNING PERIOD

There are numerous possible conceptual approaches that you can use to identify control measures for the long-term strategy and the related RPG. We suggest beginning by concentrating on possible emissions reductions of several pollutant species from a few selected source sectors, focusing on those source categories that may have the greatest impact on visibility at Class I areas, considering cost and the other factors discussed further in Section 5.0.

4.1 Consideration of Emissions Reductions from State, Federal, and Local Control Measures

One important factor to keep in mind when establishing a RPG is that you cannot adopt a RPG that represents less visibility improvement than is expected to result from the implementation of other CAA requirements.[18] You must therefore determine the amount of emission reductions that can be expected from identified sources or source categories as a result of requirements at the local, State, and federal levels during the planning period of the SIP and the resulting improvements in visibility at Class I areas. Given the significant emissions reductions that we anticipate to result from BART, the CAIR, and the implementation of other CAA programs, including the ozone and $PM_{2.5}$ NAAQS, for many States this will be an important step in determining your RPG, and it may be all that is necessary to achieve reasonable progress in the first planning period for some States.

The first step in this process is to identify the baseline emissions inventory year on which your strategies are based. For the first RHR SIP, we anticipate that States will use 2002 as the baseline year for emission inventories.[19] If you do use 2002, you may take credit in your long-term strategy for emission reductions achieved after 2002. This includes emission reductions from measures implemented to attain the ozone and $PM_{2.5}$ NAAQS,[20] and Federal programs, such as the national mobile source program and federal standards for hazardous air pollutants (air toxics).

---

[18] 40 CFR 51.308(d)(1)(vi).

[19] 40 CFR 51.308(d)(3)(iii) provides that the baseline emission inventory year is presumed to be the most recent year of the consolidated emissions inventory for the SIP. A memorandum from OAQPS, entitled *2002 Base Year Emission Inventory SIP Planning: 8-hr Ozone, PM 2.5, and Regional Haze Programs (*November 18, 2002) (“2002 EI Memo”), identifies 2002 as the anticipated baseline emission inventory year for regional haze. See www.epa.gov/ttn/oarpg/t1/memoranda/2002bye_gm.pdf

[20] 2002 EI Memo at 3-4.

4.2 Identification of Additional Emissions Control Strategies for the Source Categories Identified

After determining the amount of emissions reductions of visibility impairing pollutants that may be expected from implementation of other CAA programs, you will be ready to identify any additional measures that are reasonable. The RHR gives States wide latitude to determine additional control requirements, and there are many ways to approach identifying additional reasonable measures; however, you must at a minimum, consider the four statutory factors. Based on the contribution from certain source categories and the magnitude of their emissions you may determine that little additional analysis is required to determine further controls are not warranted for that category. As discussed further in section 5, you have considerable flexibility in how you take these factors into consideration. In addition to source-specific controls, emissions cap-and-trade programs may be considered. Sources of information on control techniques for specific source categories include the RACT/BACT/LAER Clearinghouse and EPA's AIRControlNet database.[21]

One approach that you could take to streamline what could be an extremely complex task would be to first identify alternative control scenarios with different levels of stringency. Each control scenario would assume application of specific control levels or measures to the sources or source categories you have identified as the significant sources of visibility impairment. As indicated previously in section 4.1, the starting point for this assessment is the visibility improvement achieved as a result of BART, the CAIR, and the implementation of other CAA programs, including other measures for attainment of the ozone and $PM_{2.5}$ NAAQS. You would then consider whether any additional control scenarios are reasonable based on your consideration of the statutory factors and any other factors you have determined are relevant.

Another approach you could take, consistent with the "back out" approach discussed in section 2.3, would involve identifying the set of emissions control measures that achieves the target percentage reductions in visibility-impairing pollutants associated with progress at or beyond the uniform rate of progress. The selection of control measures to include in this set would be guided by your consideration of the statutory factors and any other factors you have determined are relevant.

Note that for some sources determined to be subject to BART, the State will already have completed a BART analysis. Since the BART analysis is based, in part, on an assessment of many of the same factors that must be addressed in establishing the RPG, it is reasonable to

[21] Information on AirControlNETcan be found at www.epa.gov/ttn/ecas/econtool.html. The RACT/BACT/LAER Clearinghouse is located at http://cfpub.epa.gov/rblc/htm/bl02.cfm.

conclude that any control requirements imposed in the BART determination also satisfy the RPG-related requirements for source review in the first RPG planning period. Hence, you may conclude that no additional emissions controls are necessary for these sources in the first planning period.

5.0 APPLYING STATUTORY FACTORS TO POTENTIALLY AFFECTED STATIONARY SOURCES

In determining reasonable progress, CAA §169A(g)(1) requires States to take into consideration a number of factors. However, you have flexibility in how to take into consideration these statutory factors and any other factors that you have determined to be relevant. For example, the factors could be used to select which sources or activities should or should not be regulated, or they could be used to determine the level or stringency of control, if any, for selected sources or activities, or some combination of both. The factors may be considered both individually and/or in combination. As noted in section 4.1, given the significant emissions reductions that we anticipate to result from BART, the CAIR, and the implementation of other CAA programs, these reductions may be all that is necessary to achieve reasonable progress in the first planning period for some States. Also, as noted in section 4.2, it is not necessary for you to reassess the reasonable progress factors for sources subject to BART for which you have already completed a BART analysis.

5.1 Reasonable Progress Statutory Factor (a): Costs of Compliance

The first factor to take into consideration is the "costs of compliance." In this context we believe that the cost of compliance factor can be interpreted to encompass the cost of compliance for individual sources or source categories, and more broadly the implication of compliance costs to the health and vitality of industries within a state. For additional guidance on applying the cost of compliance factor to stationary sources, you may wish to consult the BART guidelines, referenced above.

To assess compliance costs for individual sources or source categories potentially subject to emission limitations, we suggest that you use established control cost analysis techniques. For stationary sources, generally this involves the following:[22]

a) Identify the emissions units to be controlled;

b) Identify the design parameters for emissions controls; and

c) Develop cost estimates based upon those design parameters.

[22] As noted above, application of the cost factor to non-point sources is beyond the scope of this guidance. This is also true for mobile sources.

You should evaluate both average and incremental costs. To maintain and improve consistency wherever possible, cost estimates should be based on EPA's *Air Pollution Control Cost Manual*.[23]

In considering the cost of compliance factor, you should keep in mind that different pollutants differently impact visibility impairment. For example, on a ton basis, sulfur dioxide-related particles have a greater impact on visibility impairment than crustal material. Therefore, in assessing additional emissions reduction strategies for source categories or individual, large scale sources, simple cost effectiveness estimates based on a dollar-per-ton calculation may not be as meaningful as a dollar-per-deciview calculation, especially if the strategies reduce different groups of pollutants.

5.2 Reasonable Progress Statutory Factor (b): Time Necessary for Compliance

The second factor is the "time necessary for compliance." It may be appropriate for you to use this factor to adjust the RPG to reflect the degree of improvement in visibility achievable within the period of the first SIP if the time needed for full implementation of a control measure (or measures) will extend beyond 2018. For example, if you anticipate that constraints on the availability of construction labor will preclude the installation of controls at all sources of a particular category by 2018, the visibility improvement anticipated from installation of controls at the percentage of sources that *could* be controlled within the strategy period should be considered in setting the RPG and in establishing the SIP requirements to meet the RPG.

5.3 Reasonable Progress Statutory Factor (c): Energy and Non-Air Impacts

The third factor is "energy and non-air environmental impacts." In assessing energy impacts, you may want to consider whether the energy requirements associated with a control technology result in energy penalties. For example, controls on diesel engines may decrease the engine's fuel efficiency, leading to an increase in diesel fuel consumption. Or, a particular control may require a fuel unavailable in the area. To the extent that these considerations are quantifiable they should be included in the engineering analyses supporting compliance cost estimates.

Some examples of non-air environmental impacts that you may wish to consider, are the effects of the waste stream that may be generated by a particular control technology, and/or other

---

[23] Any additional information used for the cost calculations, including any information supplied by vendors that affects your assumptions regarding purchased equipment costs, equipment life, replacement of major components, and any other element of the calculation that differs from the *Control Cost Manual*, should be documented. EPA's *Control Cost Manual* is located at: www.epa.gov/ttncatc1/products.html#cccinfo.

resource consumption rates such as water, water supply, and waste water disposal. To the extent that these considerations are quantifiable, they should also be included in the analyses supporting compliance cost estimates.

For additional guidance on applying this factor to stationary sources, you may wish to consult the BART Guidelines, referenced above.

5.4 Reasonable Progress Statutory Factor (d): The Remaining Useful Life of the Source

The fourth statutory factor is "the remaining useful life of any existing source subject to [reasonable progress] requirements." This factor is generally best treated as one element of the overall cost analysis. The "remaining useful life" of a source, if it represents a relatively short time period, may affect the annualized costs of retrofit controls. For example, the methods for calculating annualized costs in EPA's *Air Pollution Control Cost Manual* require the use of a specified time period for amortization that varies based upon the type of control. If the remaining useful life of the source will clearly exceed this time period, the remaining useful life factor has essentially no effect on control costs and on the reasonable progress determination process. Where the remaining useful life of the source is less than the time period for amortizing the costs of the retrofit control, you may wish to use this shorter time period in your cost calculations.

For additional guidance on applying this factor to stationary sources, you may wish to consult the BART Guidelines, referenced above.

Midwest RPO: Kirk Baker
SESARM: John Hornback
VISTAS: Pat Brewer

Federal Land Managers

Forest Service: Judith Logan, Ann Mebane
National Park Service: Bruce Polkowsky
U.S. Fish and Wildlife Service: Tim Allen

U.S. EPA

EPA Region 7: Bob Fenemore
EPA Region 6: Joe Kordzi
EPA Region 4: Brenda Johnson

NOTES

The goal of the first call was to kick off the communication and consultation process for the four central Class I areas in Missouri and Arkansas. The latest modeling analyses show that the four Class I areas are either meeting their 2018 goals or are very close to doing so, but the Long-Term Strategy element of the regional haze SIP still needs to be addressed. One expectation of this process is to get everyone’s input on the 2018 emissions being used to support the modeling to ensure that the best available information is reflected.

The regional haze SIPs need to be completed by December 2007. The goal is to wrap up the central Class I areas consultation process in the fall of 2007.

The tribes within CENRAP were contacted, but there may be additional tribes outside of CENRAP that need to be contacted and given an opportunity to participate in the process. Henry Harjo will provide an updated list of tribal contacts.

CENRAP is planning an additional 2018 Base G run that will include several inventory corrections and incorporate refinery initiatives in Texas and Louisiana. CENRAP may also conduct a run based on the EPA's latest IPM 3.0 results to bracket a range of EGU futures. Results will be shared with this group as they become available.

In addition to the CENRAP effort, MDNR is planning additional modeling runs for the central Class I areas. The hope is to get feedback through the consultation process on known controls that are not currently reflected in the modeling runs, including additional BART controls and any ozone or PM2.5 SIP controls, multi-pollutants strategies, etc.

Illinois is developing a model-ready file that reflects their new multi-pollutant strategy and will make it available to this group.

VISTAS has recently updated their modeling by correcting the monthly allocation of fires and making adjustments to utility emissions in Georgia, Florida, and North Carolina. The results are largely unchanged for the central Class I areas.

The technical analysis to date was developed to provide a way to determine what states should be considered for inclusion in consultation. Multiple criteria were used in determining the impacting states. KDHE developed the Q/D, and MDNR recently conducted the PMF analysis, along with obtaining the PSAT results from Environ. While AOI results are older, they provide another piece of information. Each analysis method has it's strength and weaknesses, with the merging of the results in the table helping to focus on areas and states which are more likely to impact the Central Class I areas.

Discussion comments by FLM and EPA representatives indicated their support of the analysis already conducted. Overall comments indicated this was a good first step and that source area identifications were worthwhile.

Participants in the central Class I area consultation process are encouraged to review the draft Consultation Plan and provide feedback. Justification should be provided if there's disagreement on who should be included or excluded from the process.

Once there's agreement on who should be included in the process, participating states are asked to review and provide comments on the 2018 NOx and SO2 emissions that were distributed in Excel format prior to the call. States are asked to mark where there are known BART controls, CAIR controls, or ozone/PM2.5 SIP controls in the spreadsheets.

Any communications regarding the consultation process or consultation plan should be sent to Mark McCorkle (MAC@adeq.state.ar.us), Calvin Ku (calvin.ku@dnr.mo.gov), and Jeff Peltola (jeff_peltola@yahoo.com).

Action Items:

1. Comments on the consultation plan should be provided within three weeks.

2. CENRAP will share new modeling results. No due date

3. Illinois will share new model ready file when developed. No due date

4. States begin to evaluate 2018 emissions and on the books controls, provide information . No due date

5. A dedicated page for the central Class I area consultation process will be established on the CENRAP website in the near future.

6. An email will be distributed to request everyone's availability for upcoming conference calls on the following dates: May 9 or 10; June 6, 7, or 8.

Central Class I Areas Consultation Process Call
May 11, 2007

PARTICIPANTS

VISTAS: Pat Brewer

Federal Land Managers
Forest Service: Cindy Huber
National Park Service: Bruce Polkowsky
U.S. Fish and Wildlife Service: Meredith Bond

U.S. EPA
No EPA representatives were on the call

Notes

Comments on the consultation plan were received from Illinois, Louisiana and Kansas. Illinois committed to provide emission reductions information from it's multi-pollutants strategy in our technical analyses. Louisiana submitted a letter to Missouri and Arkansas requesting to be excused from further involvement in process based on the criteria to include or exclude the state from the consultation process. Arkansas and Missouri both acknowledged that it was no longer necessary for Louisiana to be involved. Kansas asked for clarification on why they are included in the consultation process but are not listed as a contributing state. The plan will be finalized as is, including the comment letter and e-mail from these states. Any future agreements or decisions resulting from the discussions will be documented.

CENRAP Base G modeling results are expected to be available by the end of May, according to Jeff Peltola. We will provide Base G projections by next consultation call, scheduled on June 7, 2007.

Illinois is finalizing model-ready emissions files reflecting their multi-pollutant strategy and will provide the files as soon as they are completed.

A dedicated space has been set up on CENRAP's website for posting documents related to the central Class I areas consultation process-- http://www.cenrap.org/projects.asp. The consultation plan, emissions inventory spreadsheets, and other documents have been posted.

There was discussion about the request to review and confirm the 2018 emissions inventory information that supports the modeling analyses and long-term strategy. States were asked to provide feedback on detailed emissions spreadsheets by May 25. Several states said they'd be able to provide comments by May 25. States working with Midwest RPO may not respond because they are focusing their efforts on developing a new 2018 inventory that incorporates IPM 3.0 results for the utility sector.

The MRPO future-year inventory effort is differentiating between strategies that states "will do" and those that states "may do." For the central Class I areas consultation process, the initial 2018 inventory review should focus on states' "will do" strategies.

Kansas proposed setting a cutoff of 500 tons/year for emissions units to review on the emissions inventory spreadsheets; no decision was made on this issue.

Several states expressed difficulty with the long-term strategy element of the SIP. There are concerns about not having authority over certain emissions activities such as prescribed burning. There are also concerns about the lack of certainty regarding control strategies until too late in the process to incorporate the information in the SIP by the deadline. It was mentioned that Chapters 10 and 11 for Long Term Strategy would be difficult to put in regulatory language.

Bruce Polkowsky commented that the long-term strategy involves evaluating the sources impacting visibility by applying the four-factors analysis to determine what strategies are reasonable. If this can't be completed with the timeframe of the December 2007 deadline, the regional haze SIP should include a commitment to review those sources within 5 years and implement the reasonable measures within 10 years.

Kirk Baker commented that Midwest RPO's modeling shows that the central Class I areas are not all meeting their 2018 uniform rate of progress goals. The modeling results among the RPOs may never be consistent, but it's important to understand why the results are different. Mike Koerber asked what the thinking was by Missouri and Arkansas, were they considering that they would work toward a modeled goal, or would they be looking at reasonable progress by evaluating sources by the four-factor analysis? Missouri indicated they would be working to model a uniform rate of progress.

Action Items

Missouri will follow up with states on the review and confirmation of the 2018 emissions inventory and control options.

Central Class I Areas Consultation Process Call
June 7, 2007

PARTICIPANTS

States
Arkansas: Mark McCorkle
Illinois: Rob Kaleel, Scott Leopold
Indiana: Chris Pedersen, Jay Koch
Kansas
Kentucky: Lona Brewer
Louisiana: Jim Orgeron
Missouri: Wayne Graf, Terry Rowles, Wendy Vit
Oklahoma: Cheryl Bradley, Scott Thomas, Lee Warden

Notes

Prior to the call, Jeff Peltola distributed a copy of the newly released June 1, 2007 revisions to EPA's Reasonable Progress Guidance.

Wendy Vit summarized comments received from Illinois, Kansas, Tennessee, and Texas on the 2018 emissions inventory. Several states provided information on expected controls that are not reflected in CENRAP's Base G modeling. Illinois provided emissions model-ready files showing substantial emission reductions from their EGU multi-pollutant rule. Kentucky, Oklahoma, and Midwest RPO responded that they would provide information on their 2018 emissions when available. A written summary of the comments will be posted on the central Class I area webpage when completed (http://www.cenrap.org/projects.asp).

Jeff Peltola reported on the CENRAP Base G modeling results that were recently released. The results show improved visibility relative to uniform rate-of-progress for 2018 compared to the previous Base F. CENRAP plans an additional control sensitivity modeling run with cost-curve criteria equivalent to <$5,000/ton for Q/5D sources to aid in discussions on what controls might be reasonable. In addition, CENRAP plans another 2018 modeling run based on the 2018 IPM 3.0 results with edits provided by

states, including revisions made through the Midwest RPO process. Other non-EGU emission reductions based on the comments received through this consultation process may be incorporated as well.

Mark McCorkle noted that in its technical support document, CENRAP plans to present visibility projections based on the new IMPROVE equation only and provide results based on the old IMPROVE equation as part of the weight-of-evidence analysis section.

John Hornback reported that VISTAS doesn't have any modeling updates to share. VISTAS is in the process of documenting their technical work and providing support for their member's regional haze SIPs.

Wayne Graf gave an overview of the Missouri timeline for regional haze SIP completion by the December 2007 deadline. The plan is to develop a draft of the plan by June/July and a final plan by August. The plan would then need to be put on public notice by September and go to public hearing in October for submission to EPA in December. The technical support document that ENVIRON is developing for CENRAP will be a key element of the plan. It will be a living document that will be updated as better information is made available.

Arkansas will post their regional haze SIP schedule on the central Class I area webpage.

Oklahoma gave an update on their consultation process. They are completing a packet of information to distribute to tribes and states. They plan to consult with tribes first and then consult with states.

It was decided that this will be the last scheduled consultation call for the time being. If there's a need, additional call(s) will be arranged. At the CENRAP Steering Committee meeting next week, there will be discussion about wrapping up consultation processes. Arkansas will take the lead on preparing a letter for participants in the central Class I areas consultation that documents the process.

Amy Algoe-Eakin commented that the newly released regional haze guidance on determining reasonable progress may provide information relevant to the consultation processes.

Appendix V

Applicable State Rules

EFFECTIVE STATE RULES

10 CSR 10-6.300 Conformity of General Federal Actions to State Implementation Plans

PURPOSE: This rule implements section 176(c) of the Clean Air Act, as amended (42 U.S.C. 7401 et seq.) and regulations under 40 CFR part 51 subpart W, with respect to the conformity of general federal actions to the applicable implementation plan. Under those authorities, no department, agency or instrumentality of the federal government shall engage in, support in any way or provide financial assistance for, license or permit, or approve any activity which does not conform to an applicable implementation plan. This rule sets forth policy, criteria, and procedures for demonstrating and assuring conformity of such actions to the applicable implementation plan. This rule applies to all areas in the state of Missouri which are designated as nonattainment or maintenance for any criteria pollutant or standard for which there is a national ambient air quality standard.

Editor's Note: The following material is incorporated into this rule by reference:

1) 42 ***United States Code*** *7401 and 7472 (Washington D.C.: U.S. Government Printing Office, 1989)*

2) 40 ***Code of Federal Regulatons*** *part 50; part 51, subpart W, Revised as of July 1, 1995; and part 81 (Washington, D.C.: U.S. Government Printing Office, 1995);*

3) 23 ***United States Code*** *(Washington D.C.: U.S. Government Printing Office, 1995);*

4) 49 ***United States Code*** *1601 and 1607 (Washington, D.C.: U.S. Governmental Printing Office, 1995);*

5) 23 ***United States Code 134 (Washington D.C.: U.S. Government Printing Office, 1995);***

6) 40 Code *of Federal Regulations (Washington D.C.: U.S. Government Printing Office, 1995);*

*7) Environmental Protection Agency "****Compilation of Air Pollutant Emission Factors (AP42)****" 5th Edition, Jan. 1995, Office of Air Quality Planning and Standards, Office of Air and Radiation, E.P.A. Research Triangle Park, NC 27711);*

8) ***Guidelines on Air Quality Models*** *(Revised July 1986) (Research Triangle Park, N.C.: U.S. Environmental Protection Agency 1986).*

In accordance with section 536.031(4), RSMo, the full text of material incorporated by reference will be made available to any interested person at the Office of the Secretary of State and the headquarters of the adopting state agency.

(1) General.

(A) No department, agency or instrumentality of the federal government shall engage in, support in any way or provide financial assistance for, license or permit, or approve any activity which does not conform to an applicable implementation plan.

(B) Under Clean Air Act (CAA) section 176(c) and 40 CFR part 51 subpart W, a federal agency must make a determination that a federal action conforms to the applicable implementation plan in accordance with the requirements of this rule before the action is taken.

(C) Subsection (1)(B) of this rule does not include federal actions where either--

1. A National Environmental Policy Act (NEPA) analysis was completed as evidenced by a final environmental assessment (EA), environmental impact statement (EIS), or finding of no significant impact (FONSI) that was prepared prior to January 31, 1994; or

2. All of the following conditions are met:

A. Prior to January 31, 1994, an EA was commenced or a contract was awarded to develop the specific environmental analysis;

B. Sufficient environmental analysis is completed by March 15, 1994, so that the federal agency may determine that the federal action is in conformity with the specific requirements and the purposes of the applicable implementation plan pursuant to the agency's affirmative obligation under section 176(c) of the CAA; and

C. A written determination of conformity under section 176(c) of the CAA has been made by the federal agency responsible for the federal action by March 15, 1994.

(D) Notwithstanding any provision of this rule, a determination that an action is in conformity with the applicable implementation plan does not exempt the action from any other requirements of the applicable implementation plan, the NEPA, or the CAA.

(2) Definitions.

(A) Terms used but not defined in this rule shall have the meaning given them by the CAA and Environmental Protection Agency's (EPA's) regulations, in that order of priority. Definitions for some terms used in this rule may be found in 10 CSR 10-6.020.

(B) Additional definitions specific to this rule are as follows:

1. Affected federal land manager—the federal agency or the federal official charged with direct responsibility for management of an area designated as Class I under the CAA (42 U.S.C. 7472) that is located within one hundred kilometers (100 km) of the proposed federal action;

2. Applicable implementation plan—the (portion) of the implementation plan, or most recent revision thereof, which has been approved under section 110 of the CAA, or promulgated under section 110(c) of the CAA (federal implementation plan), or promulgated or approved pursuant to regulations promulgated under section 301(d) of the CAA and which implements the relevant requirements of the CAA;

3. Area wide air quality modeling analysis—an assessment on a scale that includes the entire nonattainment or maintenance area which uses an air quality dispersion model to determine the effects of emissions on air quality;

4. CAA—the Clean Air Act, as amended;

5. Cause or contribute to a new violation—a federal action that—

A. Causes a new violation of a national ambient air quality standard (NAAQS) at a location in a nonattainment or maintenance area which would otherwise not be in violation of the standard during the future period in question if the federal action were not taken; or

B. Contributes, in conjunction with other reasonably foreseeable actions, to a new violation of a NAAQS at a location in a nonattainment or maintenance area in a manner that would increase the frequency or severity of the new violation;

6. Caused by, as used in the terms "direct emissions" and "indirect emissions"—emissions that would not otherwise occur in the absence of the federal action;

7. Criteria pollutant or standard—any pollutant for which there is established a NAAQS at 40 CFR part 50;

8. Direct emissions—those emissions of a criteria pollutant or its precursors that are caused or initiated by the federal action and occur at the same time and place as the action;

9. Emergency—a situation where extremely quick action on the part of the federal agencies involved is needed and where the timing of such federal activities makes it impractical to meet the requirements of this rule, such as natural disasters like hurricanes or earthquakes, civil disturbances such as terrorist acts, and military mobilizations;

10. Emissions budgets—those portions of the total allowable emissions defined in an EPA approved revision to the applicable implementation plan for a certain date for the purpose of meeting reasonable further progress milestones or attainment or maintenance demonstrations, for any criteria pollutant or its precursors, specifically allocated by the applicable implementation plan to mobile sources, to any stationary source or class of stationary sources, to any federal action or class of action, to any class of area sources, or to any subcategory of the emissions inventory. The allocation system must be specific enough to assure meeting the criteria of section 176(c)(1)(B) of the CAA. An emissions budget may be expressed in terms of an annual period, a daily period, or other period established in the applicable implementation plan;

11. Emission offsets, for purposes of section (8) of this rule—emissions reductions which are quantifiable, consistent with the applicable implementation plan attainment and reasonable further progress demonstrations, surplus to reductions required by, and credited to, other applicable implementation plan provisions, enforceable under both state and federal law, and permanent within the time frame specified by the program. Emissions reductions intended to be achieved as emissions offsets under this rule must be monitored and enforced in a manner equivalent to that under EPA's new source review requirements;

12. Emissions that a federal agency has a continuing program responsibility for—emissions that are specifically caused by an agency carrying out its authorities, and does not include emissions that occur due to subsequent activities, unless such activities are required by the federal agency. Where an agency, in performing its normal program responsibilities, takes actions itself or imposes conditions that result in air pollutant emissions by a nonfederal entity taking subsequent actions, such emissions are covered by the meaning of a continuing program responsibility;

13. EPA—the United States Environmental Protection Agency;

14. Federal action—any activity engaged in by a department, agency, or instrumentality of the federal government, or any activity that a department, agency or instrumentality of the federal government supports in any way, provides financial assistance for, licenses, permits, or approves, other than activities related to transportation plans, programs, and projects developed, funded, or approved under Title 23 U.S.C. or the Federal Transit Act (49 U.S.C. 1601 et seq.). Where the federal action is a permit, license, or other approval for some aspect of a nonfederal undertaking, the relevant activity is the part, portion, or phase of the nonfederal undertaking that requires the federal permit, license, or approval;

15. Federal agency—for purposes of this rule, a federal department, agency, or instrumentality of the federal government;

16. Increase the frequency or severity of any existing violation of any standard in any area—to cause a nonattainment area to exceed a standard more often or to cause a violation at a greater concentration than previously existed or would otherwise exist during the future period in question, if the project were not implemented;

17. Indirect emissions—those emissions of a criteria pollutant or its precursors that—

A. Are caused by the federal action, but may occur later in time or may be farther removed in distance from the action itself but are still reasonably foreseeable; and

B. The federal agency can practicably control and will maintain control due to a continuing program responsibility of the federal agency, including, but not limited to—

(I) Traffic on or to, or stimulated or accommodated by, a proposed facility which is related to increases or other changes in the scale or timing of operations of such facility;

(II) Emissions related to the activities of employees of contractors or federal employees;

(III) Emissions related to employee commutation and similar programs to increase average vehicle occupancy imposed on all employers of a certain size in the locality; or

(IV) Emissions related to the use of federal facilities under lease or temporary permit.

18. Local air quality modeling analysis—an assessment of localized impacts on a scale smaller than the entire nonattainment or maintenance area, including, for example, congested roadway intersections and highways or transit terminals, which uses an air quality dispersion model to determine the effects of emissions on air quality;

19. Maintenance area—any geographic region of the United States previously designated nonattainment pursuant to the CAA Amendments of 1990 and subsequently redesignated to attainment subject to the requirement to develop a maintenance plan under section 175A of the CAA;

20. Maintenance plan—a revision to the applicable implementation plan, meeting the requirements of section 175A of the CAA;

21. Metropolitan planning organization (MPO)—that organization designated as being responsible, together with the state, for conducting the continuing, cooperative, and comprehensive planning process under 23 U.S.C. 134 and 49 U.S.C. 1607;

22. Milestone—has the meaning given in sections 182(g)(1) and 189(c)(1) of the CAA. A milestone consists of an emissions level and the date on which it is required to be achieved;

23. National ambient air quality standards (NAAQS)—those standards established pursuant to section 109 of the CAA and include standards for carbon monoxide (CO), lead (Pb), nitrogen dioxide (NO_2), ozone, particulate matter (PM_{10}), and sulfur dioxide (SO_2);

24. NEPA—the National Environmental Policy Act of 1969, as amended (42 U.S.C. 4321 et seq.);

25. Nonattainment area (NAA)—any geographic area of the United States which has been designated as nonattainment under section 107 of the CAA and described in 40 CFR part 81;

26. Precursors of a criteria pollutant—

A. For ozone, nitrogen oxides (NO_x) (unless an area is exempted from NO_x requirements under section 182(f) of the CAA), and volatile organic compounds (VOCs); and

B. For PM_{10}, those pollutants described in the PM_{10} nonattainment area applicable implementation plan as significant contributors to the PM_{10} levels;

27. Reasonably foreseeable emissions—projected future indirect emissions that are identified at the time the conformity determination is made; the location of such emissions is known to the extent adequate to determine the impact of such emissions; and the emissions are quantifiable, as described and documented by the federal agency based on its own information and after reviewing any information presented to the federal agency;

28. Regionally significant action—a federal action for which the direct and indirect emissions of any pollutant represent ten percent (10%) or more of a nonattainment or maintenance area's emissions inventory for that pollutant;

29. Regional water or wastewater projects—include construction, operation, and maintenance of water or wastewater conveyances, water or wastewater treatment facilities, and water storage reservoirs which affect a large portion of a nonattainment or maintenance area; and

30. Total of direct and indirect emissions—the sum of direct and indirect emissions increases and decreases caused by the federal action; that is, the net emissions considering all direct and indirect emissions. Any emissions decreases used to reduce such total shall have already occurred or shall be enforceable under state and federal law. The portion of emissions which are exempt or presumed to conform under subsections (3)(C), (D), (E), or (F) of this rule are not included in the "total of direct and indirect emissions," except as provided in subsection (3)(J). The "total of direct and indirect emissions" includes emissions of criteria pollutants and emissions of precursors of criteria pollutants. The segmentation of projects for conformity analyses when emissions are reasonably foreseeable is not permitted by this rule.

(3) Applicability.

(A) Conformity determinations for federal actions related to transportation plans, programs, and projects developed, funded, or approved under Title 23 U.S.C. or the Federal Transit Act (49 U.S.C. 1601 et seq.) must meet the procedures and criteria of 10 CSR 10-2.390 and 10 CSR 10-5.480, in lieu of the procedures set forth in this rule.

(B) For federal actions not covered by subsection (3)(A) of this rule, a conformity determination is required for each pollutant where the total of direct and indirect emissions in a nonattainment or maintenance area caused by a federal action would equal or exceed any of the rates in paragraph (3)(B)1. or 2. of this rule.

1. For purposes of subsection (3)(B) of this rule, the following rates apply in nonattainment areas (NAAs):

	Tons/Year
Ozone (VOC or NO_x)	
Serious NAAs	50
Severe NAAs	25
Extreme NAAs	10
Other ozone NAAs outside an ozone transport region	100

Marginal and moderate NAAs inside an ozone transport region	
VOC	50
NO_x	100
Carbon monoxide	
All NAAs	100
SO_2 or NO_2	
All NAAs	100
PM_{10}	
Moderate NAAs	100
Serious NAAs	70
Pb	
All NAAs	25

2. For purposes of subsection (3)(B) of this rule, the following rates apply in maintenance areas:

	Tons/Year
Ozone (NO_x), SO_2 or NO_2	
All maintenance areas	100
Ozone (VOC)	
Maintenance areas inside an ozone transport region	50
Maintenance areas outside an ozone transport region	100
Carbon monoxide	
All maintenance areas	100
PM_{10}	
All maintenance areas	100
Pb	
All maintenance areas	25

(C) The requirements of this rule shall not apply to—

1. Actions where the total of direct and indirect emissions are below the emissions levels specified in subsection (3)(B) of this rule;

2. The following actions which would result in no emissions increase or an increase in emissions that is clearly de minimis:

A. Judicial and legislative proceedings;

B. Continuing and recurring activities such as permit renewals where activities conducted will be similar in scope and operation to activities currently being conducted;

C. Rulemaking and policy development and issuance;

D. Routine maintenance and repair activities, including repair and maintenance of administrative sites, roads, trails, and facilities;

E. Civil and criminal enforcement activities, such as investigations, audits, inspections, examinations, prosecutions, and the training of law enforcement personnel;

F. Administrative actions such as personnel actions, organizational changes, debt management or collection, cash management, internal agency audits, program budget proposals, and matters relating to the administration and collection of taxes, duties and fees;

G. The routine, recurring transportation of material and personnel;

H. Routine movement of mobile assets, such as ships and aircraft, in home port reassignments and stations (when no new support facilities or personnel are required) to perform as operational groups or for repair or overhaul;

I. Maintenance dredging and debris disposal where no new depths are required, applicable permits are secured, and disposal will be at an approved disposal site;

J. With respect to existing structures, properties, facilities and lands where future activities conducted will be similar in scope and operation to activities currently being conducted at the existing structures, properties, facilities, and lands, actions such as relocation of personnel, disposition of federally-owned existing structures, properties, facilities, and lands, rent subsidies, operation and maintenance cost subsidies, the exercise of receivership or conservatorship authority, assistance in purchasing structures, and the production of coins and currency;

K. The granting of leases, licenses such as for exports and trade, permits, and easements where activities conducted will be similar in scope and operation to activities currently being conducted;

L. Planning, studies, and provision of technical assistance;

M. Routine operation of facilities, mobile assets and equipment;

N. Transfers of ownership, interests, and titles in land, facilities, and real and personal properties, regardless of the form or method of the transfer;

O. The designation of empowerment zones, enterprise communities, or viticultural areas;

P. Actions by any of the federal banking agencies or the federal reserve banks, including actions regarding charters, applications, notices, licenses, the supervision or examination of depository institutions or depository institution holding companies, access to the discount window, or the provision of financial services to banking organizations or to any department, agency or instrumentality of the United States;

Q. Actions by the Board of Governors of the Federal Reserve System or any federal reserve bank to effect monetary or exchange rate policy;

R. Actions that implement a foreign affairs function of the United States;

S. Actions (or portions thereof) associated with transfers of land, facilities, title, and real properties through an enforceable contract or lease agreement where the delivery of the deed is required to occur promptly after a specific, reasonable condition is met, such as promptly after the land is certified as meeting the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and where the federal agency does not retain continuing authority to control emissions associated with the lands, facilities, title, or real properties;

T. Transfers of real property, including land, facilities, and related personal property from a federal entity to another federal entity and assignments of real property, including land, facilities, and related personal property from a federal entity to another federal entity for subsequent deeding to eligible applicants; and

U. Actions by the Department of the Treasury to effect fiscal policy and to exercise the borrowing authority of the United States;

3. Actions where the emissions are not reasonably foreseeable, such as the following:

A. Initial Outer Continental Shelf lease sales which are made on a broad scale and are followed by exploration and development plans on a project level; and

B. Electric power marketing activities that involve the acquisition, sale and transmission of electric energy; and

4. Individual actions which implement a decision to conduct or carry out a program that has been found to conform to the applicable implementation plan, such as prescribed burning actions which are consistent with a land management plan that has been found to conform to the applicable implementation plan.

(D) Notwithstanding the other requirements of this rule, a conformity determination is not required for the following federal actions (or portion thereof):

1. The portion of an action that includes major new or modified stationary sources that require a permit under the new source review (NSR) program (section 173 of the CAA) or the prevention of significant deterioration (PSD) program (Title I, part C of the CAA);

2. Actions in response to emergencies or natural disasters such as hurricanes, earthquakes, etc., which are commenced on the order of hours or days after the emergency or disaster and, if applicable, which meet the requirements of subsection (3)(E) of this rule;

3. Research, investigations, studies, demonstrations, or training other than those exempted under paragraph (3)(C)2, of this rule, where no environmental detriment is incurred or the particular action furthers air quality research, as determined by the department;

4. Alteration and additions of existing structures as specifically required by new or existing applicable environmental legislation or environmental regulations (for example, hush houses for aircraft engines and scrubbers for air emissions); and

5. Direct emissions from remedial and removal actions carried out under the CERCLA and associated regulations to the extent such emissions either comply with the substantive requirements of the PSD/NSR permitting program or are exempted from other environmental regulation under the provisions of CERCLA and applicable regulations issued under CERCLA.

(E) Federal actions which are part of a continuing response to an emergency or disaster under paragraph (3)(D)2. of this rule and which are to be taken more than six (6) months after the commencement of the response to the emergency or disaster under paragraph (3)(D)2. of this rule are exempt from the requirements of this rule only if--

1. The federal agency taking the actions makes a written determination that, for a specified period not to exceed an additional six (6) months, it is impractical to prepare the conformity analyses which would otherwise be required and the actions cannot be delayed due to overriding concerns for public health and welfare, national security interests and foreign policy commitments; or

2. For actions which are to be taken after those actions covered by paragraph (3)(E)1. of this rule, the federal agency makes a new determination as provided in paragraph (3)(E)1. of this rule.

(F) Notwithstanding other requirements of this rule, individual actions or classes of actions specified by individual federal agencies that have met the criteria set forth in either paragraph (3)(G)1. or 2. and the procedures set forth in subsection (3)(H) of this rule are presumed to conform, except as provided in subsection (3)(J) of this rule.

(G) The federal agency must meet the criteria for establishing activities that are presumed to conform by fulfilling the requirements set forth in either paragraph (3)(G)1. or 2. of this rule.

1. The federal agency must clearly demonstrate using methods consistent with this rule that the total of direct and indirect emissions from the type of activities which would be presumed to conform would not--

A. Cause or contribute to any new violation of any standard in any area;

B. Interfere with provisions in the applicable implementation plan for maintenance of any standard;

C. Increase the frequency or severity of any existing violation of any standard in any area; or

D. Delay timely attainment of any standard or any required interim emission reductions or other milestones in any area including, where applicable, emission levels specified in the applicable implementation plan for purposes of—

(I) A demonstration of reasonable further progress;

(II) A demonstration of attainment; or

(III) A maintenance plan; or

2. The federal agency must provide documentation that the total of direct and indirect emissions from such future actions would be below the emission rates for a conformity determination that are established in subsection (3)(B) of this rule, based, for example, on similar actions taken over recent years.

(H) In addition to meeting the criteria for establishing exemptions set forth in paragraph (3)(G)1. or 2. of this rule, the following procedures must also be complied with to presume that activities will conform:

1. The federal agency must identify through publication in the Federal Register its list of proposed activities that are presumed to conform and the analysis, assumptions, emissions factors, and criteria used as the basis for the presumptions;

2. The federal agency must notify the appropriate EPA regional office(s), state and local air quality agencies and, where applicable, the agency designated under section 174 of the CAA and the MPO and provide at least thirty (30) days for the public to comment on the list of proposed activities presumed to conform;

3. The federal agency must document its response to all the comments received and make the comments, response, and final list of activities available to the public upon request; and

4. The federal agency must publish the final list of such activities in the *Federal Register*.

(I) Notwithstanding the other requirements of this rule, when the total of direct and indirect emissions of any pollutant from a federal action does not equal or exceed the rates specified in subsection (3)(B) of this rule, but represents ten percent (10%) or more of a nonattainment or maintenance area's total emissions of that pollutant, the action is defined as a regionally significant action and the requirements of sections (1) and (5) (10) of this rule shall apply for the federal action.

(J) Where an action presumed to be ***de minimis*** under paragraph (3)(C)1. or 2. of this rule or otherwise presumed to conform under subsection (3)(F) of this rule is a regionally significant action or where an action otherwise presumed to conform under subsection (3)(F) of this rule does not in fact meet one (1) of the criteria in paragraph (3)(G)1. of this rule, that action shall not be considered ***de minimis*** or presumed to conform and the requirements of sections (1) and (5) (10) of this rule shall apply for the federal action.

(K) The provisions of this rule shall apply in all nonattainment and maintenance areas.

(L) Any measures used to affect or determine applicability of this rule, as determined under this section, must result in projects that are in fact ***de minimis***, must result in such ***de minimis*** levels prior to the time the applicability determination is made, and must be state or federally enforceable. Any measures that are intended to reduce air quality impacts for this purpose must be identified (including the identification and quantification of all emission reductions claimed) and the process for implementation (including any necessary funding of such measures and tracking of such emission reductions) and enforcement of such measures must be described, including an implementation schedule containing explicit timelines for implementation. Prior to a determination of applicability, the federal agency making the determination must obtain written commitments from the appropriate persons or agencies to implement any measures which are identified as conditions for making such determinations. Such written commitment shall describe such mitigation measures and the nature of the commitment, in a manner consistent with the previous sentence. After this rule is approved by EPA as a revision to the applicable implementation plan, enforceability through the applicable implementation plan of any measures necessary for a determination of applicability will apply to all persons who agree to reduce direct and indirect emissions associated with a federal action for a conformity applicability determination.

(4) Conformity Analysis. Any federal department, agency, or instrumentality of the federal government taking an action subject to 40 CFR part 51 subpart W and this rule must make its own conformity determination consistent with the requirements of this rule. In making its conformity determination, a federal agency must consider comments from any interested parties. Where multiple federal agencies have jurisdiction for various aspects of a project, a federal agency may choose to adopt the analysis of another federal agency (to the extent the proposed action and impacts analyzed are the same as the project for which a conformity determination is required) or develop its own analysis in order to make its conformity determination.

(5) Reporting Requirements.

(A) A federal agency making a conformity determination under section (8) must provide to the appropriate EPA regional office(s), state and local air quality agencies and, where applicable, affected federal land managers, the agency designated under section 174 of the CAA and the MPO a thirty (30)-day notice which describes the proposed action and the federal agency's draft conformity determination on the action.

(B) A federal agency must notify the appropriate EPA regional office(s), state and local air quality agencies and, where applicable, affected federal land managers, the agency designated under section 174 of the CAA and the MPO within thirty (30) days after making a final conformity determination under section (8).

(6) Public Participation and Consultation.

(A) Upon request by any person regarding a specific federal action, a federal agency must make available for review its draft conformity determination under section (8) with supporting materials which describe the analytical methods, assumptions, and conclusions relied upon in making the applicability analysis and draft conformity determination.

(B) A federal agency must make public its draft conformity determination under section (8) by placing a notice by prominent advertisement in a daily newspaper of general circulation in the areas affected by the action and by providing thirty (30) days for written public comment prior to taking any formal action on the draft determination. This comment period may be concurrent with any other public involvement, such as occurs in the NEPA process.

(C) A federal agency must document its response to all the comments received on its draft conformity determination under section (8) and make the comments and responses available, upon request by any person regarding a specific federal action, within thirty (30) days of the final conformity determination.

(D) A federal agency must make public its final conformity determination under section (8) for a federal action by placing a notice by prominent advertisement in a daily newspaper of general circulation in the areas affected by the action within thirty (30) days of the final conformity determination.

(7) Frequency of Conformity Determinations.

(A) The conformity status of a federal action automatically lapses five (5) years from the date a final conformity determination is reported under section (5), unless the federal action has been completed or a continuous program has been commenced to implement that federal action within a reasonable time.

(B) Ongoing federal activities at a given site showing continuous progress are not new actions and do not require periodic redeterminations so long as the emissions associated with such activities are within the scope of the final conformity determination reported under section (5).

(C) If, after the conformity determination is made, the federal action is changed so that there is an increase in the total of direct and indirect emissions above the levels in subsection (3)(B), a new conformity determination is required.

(8) Criteria for Determining Conformity of General Federal Actions.

(A) An action required under section (3) to have a conformity determination for a specific pollutant, will be determined to conform to the applicable implementation plan if, for each pollutant that exceeds the rates in subsection (3)(B), or otherwise requires a conformity determination due to the total of direct and indirect emissions from the action, the action meets the requirements of subsection (8)(C) of this rule, and meets any of the following requirements:

1. For any criteria pollutant, the total of direct and indirect emissions from the action are specifically identified and accounted for in the applicable implementation plan's attainment or maintenance demonstration;

2. For ozone or nitrogen dioxide, the total of direct and indirect emissions from the action are fully offset within the same nonattainment or maintenance area through a revision to the applicable implementation plan or a measure similarly enforceable under state and federal law that effects emission reductions so that there is no net increase in emissions of that pollutant;

3. For any criteria pollutant, except ozone and nitrogen dioxide, the total of direct and indirect emissions from the action meet the requirements—

A. Specified in subsection (8)(B) of this rule, based on areawide air quality modeling analysis and local air quality modeling analysis; or

B. Specified in paragraph (8)(A)5. of this rule and, for local air quality modeling analysis, the requirement of subsection (8)(B) of this rule;

4. For CO or PM_{10}—

A. Where the department determines (in accordance with sections (5) and (6) and consistent with the applicable implementation plan) that an areawide air quality modeling analysis is not needed, the total of direct and indirect emissions from the action meet the requirements specified in subsection (8)(B) of this rule, based on local air quality modeling analysis; or

B. Where the department determines (in accordance with sections (5) and (6) and consistent with the applicable implementation plan) that an areawide air quality modeling analysis is appropriate and that a local air quality modeling analysis is not needed, the total of direct and indirect emissions from the action meet the requirements specified in subsection (8)(B) of this rule, based on areawide modeling, or meet the requirements of paragraph (8)(A)5. of this rule; or

5. For ozone or nitrogen dioxide, and for purposes of subparagraphs (8)(A)3.B. and (8)(A)4.B. of this rule, each portion of the action or the action as a whole meets any of the following requirements:

A. Where EPA has approved a revision to an area's attainment or maintenance demonstration after 1990 and the state makes a determination as provided in part (I) or where the state makes a commitment as provided in part (II). Any such determination or commitment shall be made in compliance with sections (5) and (6).

(I) The total of direct and indirect emissions from the action (or portion thereof) is determined and documented by the department to result in a level of emissions which, together with all other emissions in the nonattainment (or maintenance) area, would not exceed the emissions budgets specified in the applicable implementation plan.

(II) The total of direct and indirect emissions from the action (or portion thereof) is determined by the department to result in a level of emissions which, together with all other emissions in the nonattainment (or maintenance) area, would exceed an emissions budget specified in the applicable implementation plan and the department makes a written commitment to EPA which includes the following:

(a) A specific schedule for adoption and submittal of a revision to the applicable implementation plan which would achieve the needed emission reductions prior to the time emissions from the federal action would occur;

(b) Identification of specific measures for incorporation into the applicable implementation plan which would result in a level of emissions which, together with all other emissions in the nonattainment or maintenance area, would not exceed any emissions budget specified in the applicable implementation plan;

(c) A demonstration that all existing applicable implementation plan requirements are being implemented in the area for the pollutants affected by the federal action, and that local authority to implement additional requirements has been fully pursued;

(d) A determination that the responsible federal agencies have required all reasonable mitigation measures associated with their action; and

(e) Written documentation including all air quality analyses supporting the conformity determination.

(III) Where a federal agency made a conformity determination based on a state commitment under part (8)(A)5.A.(II) of this rule, such a state commitment is automatically deemed a call for an implementation plan revision by EPA under section 110(k)(5) of the CAA, effective on the date of the federal conformity determination and requiring response within eighteen (18) months or any shorter time within which the state commits to revise the applicable implementation plan;

B. The action (or portion thereof), as determined by the MPO, is specifically included in a current transportation plan and transportation improvement program which have been found to conform to the applicable implementation plan under 10 CSR 10-2.390 or 10 CSR 10-5.480;

C. The action (or portion thereof) fully offsets its emissions within the same nonattainment or maintenance area through a revision to the applicable implementation plan or an equally enforceable measure that effects emission reductions equal to or greater than the total of direct and indirect emissions from the action so that there is no net increase in emissions of that pollutant;

D. Where EPA has not approved a revision to the relevant implementation plan attainment or maintenance demonstration since 1990, the total of direct and indirect emissions from the action for the future years (described in subsection (9)(D) of this rule) do not increase emissions with respect to the baseline emissions, and--

(I) The baseline emissions reflect the historical activity levels that occurred in the geographic area affected by the proposed federal action during-—

(a) Calendar year 1990;

(b) The calendar year that is the basis for the classification (or, where the classification is based on multiple years, the year that is most representative in terms of the level of activity), if a classification is promulgated in 40 CFR part 81; or

(c) The year of the baseline inventory in the PM_{10} applicable implementation plan; and

(II) The baseline emissions are the total of direct and indirect emissions calculated for the future years (described in subsection (9)(D) of this rule) using the historic activity levels (described in part (8)(A)5.D.(I) of this rule) and appropriate emission factors for the future years; or

E. Where the action involves regional water or wastewater projects, such projects are sized to meet only the needs of population projections that are in the applicable implementation plan, based on assumptions regarding per capita use that are developed or approved in accordance with subsection (9)(A).

(B) The areawide and local air quality modeling analyses must--

1. Meet the requirements in section (9); and

2. Show that the action does not--

A. Cause or contribute to any new violation of any standard in any area; or

B. Increase the frequency or severity of any existing violation of any standard in any area.

(C) Notwithstanding any other requirements of this section, an action subject to this rule may not be determined to conform to the applicable implementation plan unless the total of direct and indirect emissions from the action is in compliance or consistent with all relevant requirements and milestones contained in the applicable implementation plan, such as elements identified as part of the reasonable further progress schedules, assumptions specified in the attainment or maintenance demonstration, prohibitions, numerical emission limits, and work practice requirements, and such action is otherwise in compliance with all relevant requirements of the applicable implementation plan.

(D) Any analyses required under this section must be completed, and any mitigation requirements necessary for a finding of conformity must be identified in compliance with section (10), before the determination of conformity is made.

(9) Procedures for Conformity Determinations of General Federal Actions.

(A) The analyses required under this rule must be based on the latest planning assumptions.

1. All planning assumptions (including, but not limited to, per capita water and sewer use, vehicle miles traveled per capita or per household, trip generation per household, vehicle occupancy, household size, vehicle fleet mix, vehicle ownership, wood stoves per household, and the geographic distribution of population growth) must be derived from the estimates of current and future population, employment, travel, and congestion most recently developed by the MPO. The conformity determination must also be based on the latest assumptions about current and future background concentrations and other federal actions.

2. Any revisions to these estimates used as part of the conformity determination, including projected shifts in geographic location or level of population, employment, travel, and congestion, must be approved by the MPO or other agency authorized to make such estimates for the area.

(B) The analyses required under this rule must be based on the latest and most accurate emission estimation techniques available as described below, unless such techniques are inappropriate. If such techniques are inappropriate and written approval of the EPA regional administrator is obtained for any modification or substitution, they may be modified or another technique substituted on a case-by-case basis or, where appropriate, on a generic basis for a specific federal agency program.

1. For motor vehicle emissions, the most current version of the motor vehicle emissions model specified by EPA for use in the preparation or revision of implementation plans in the state or area must be used for the conformity analysis as specified below:

A. The EPA must publish in the *Federal Register* a notice of availability of any new motor vehicle emissions model; and

B. A grace period of three (3) months shall apply during which the motor vehicle emissions model previously specified by EPA as the most current version may be used. Conformity analyses for which the analysis was begun during the grace period or no more than three (3) years before the *Federal Register* notice of availability of the latest emission model may continue to use the previous version of the model specified by EPA.

2. For nonmotor vehicle sources, including stationary and area source emissions, the latest emission factors specified by EPA in the "Compilation of Air Pollutant Emission Factors (AP-42)" must be used for the conformity analysis unless more accurate emission data are available, such as actual stack test data from stationary sources which are part of the conformity analysis.

(C) The air quality modeling analyses required under this rule must be based on the applicable air quality models, databases, and other requirements specified in the most recent version of the "Guideline on Air Quality Models (Revised)" (1986), including supplements (EPA publication no. 450/2-78-027R), unless--

1. The guideline techniques are inappropriate, in which case the model may be modified or another model substituted on a case-by-case basis or, where appropriate, on a generic basis for a specific federal agency program; and

2. Written approval of the EPA regional administrator is obtained for any modification or substitution.

(D) The analyses required under this rule must be based on the total of direct and indirect emissions from the action and must reflect emission scenarios that are expected to occur under each of the following cases:

1. The CAA mandated attainment year or, if applicable, the farthest year for which emissions are projected in the maintenance plan;

2. The year during which the total of direct and indirect emissions from the action for each pollutant analyzed is expected to be the greatest on an annual basis; and

3. Any year for which the applicable implementation plan specifies an emissions budget.

(10) Mitigation of Air Quality Impacts.

(A) Any measures that are intended to mitigate air quality impacts must be identified (including the identification and quantification of all emission reductions claimed) and the process for implementation (including any necessary funding of such measures and tracking of such emission reductions) and enforcement of such measures must be described, including an implementation schedule containing explicit timelines for implementation.

(B) Prior to determining that a federal action is in conformity, the federal agency making the conformity determination must obtain written commitments from the appropriate persons or agencies to implement any mitigation measures which are identified as conditions for making conformity determinations. Such written commitment shall describe such mitigation measures and the nature of the commitment, in a manner consistent with subsection (10)(A) of this rule.

(C) Persons or agencies voluntarily committing to mitigation measures to facilitate positive conformity determinations must comply with the obligations of such commitments.

(D) In instances where the federal agency is licensing, permitting or otherwise approving the action of another governmental or private entity, approval by the federal agency must be conditioned on the other entity meeting the mitigation measures set forth in the conformity determination, as provided in subsection (10)(A) of this rule.

(E) When necessary because of changed circumstances, mitigation measures may be modified so long as the new mitigation measures continue to support the conformity determination in accordance with sections (8) and (9) and this section. Any proposed change in the mitigation measures is subject to the reporting requirements of section (5) and the public participation requirements of section (6).

(F) Written commitments to mitigation measures must be obtained prior to a positive conformity determination and such commitments must be fulfilled.

(G) After this rule is approved by EPA as an implementation plan revision, any agreements, including mitigation measures, necessary for a conformity determination will be both state and federally enforceable. Enforceability through the applicable implementation plan will apply to all persons who agree to mitigate direct and indirect emissions associated with a federal action for a conformity determination.

(11) Savings Provision. The federal conformity rules under 40 CFR part 51 subpart W, in addition to any existing applicable state requirements, establish the conformity criteria and procedures necessary to meet the requirements of Clean Air Act section 176(c) until such time as this rule is approved by EPA as an implementation plan revision. Following EPA approval of this rule as a revision to the applicable implementation plan (or a portion thereof), the approved (or approved portion of the) state criteria and procedures will govern conformity determinations and the federal conformity regulations contained in 40 CFR part 93 will apply only for the portion, if any, of the state's conformity provisions that is not approved by EPA. In addition, any previously applicable implementation plan requirements relating to conformity remain enforceable until the state revises its applicable implementation plan to specifically remove them and that revision is approved by EPA.

AUTHORITY: section 643.050, RSMo 1994. Original rule filed Oct. 4, 1994, effective May 28, 1995. Amended: Filed Jan. 30, 1996, effective Sept. 30, 1996.*
**Original authority 1965, amended 1972, 1992, 1993, 1995.*

10 CSR 10-6.362 Clean Air Interstate Rule Annual NO_x Trading Program

PURPOSE: This rule adopts the U.S. Environmental Protection Agency's (EPA) regional trading program for nitrogen oxides, which was developed to meet the requirements of the Clean Air Interstate Rule. The Clean Air Interstate Rule was published on May 12, 2005. The evidence supporting the need for this proposed rulemaking, per section 536.016, RSMo, is the U.S. Environmental Protection Agency's Clean Air Interstate Rule published on May 12, 2005.

PUBLISHER'S NOTE: The secretary of state has determined that the publication of the entire text of the material which is incorporated by reference as a portion of this rule would be unduly cumbersome or expensive. This material as incorporated by reference in this rule shall be maintained by the agency at its headquarters and shall be made available to the public for inspection and copying at no more than the actual cost of reproduction. This note applies only to the reference material. The entire text of the rule is printed here.

(1) Applicability.

(A) Except as provided in subsection (1)(B) of this rule—

1. The following units in this state shall be Clean Air Interstate Rule (CAIR) nitrogen oxides (NO_x) units, and any source that includes one (1) or more such units shall be a CAIR NO_x source, subject to the requirements of this rule: any stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the later of November 15, 1990 or the startup of the unit's combustion chamber, a generator with nameplate capacity of more than twenty-five (25) megawatts electric (MWe) producing electricity for sale.

2. If a stationary boiler or stationary combustion turbine that, under paragraph (1)(A)1. of this rule, is not a CAIR NO_x unit begins to combust fossil fuel or to serve a generator with nameplate capacity of more than twenty-five (25) MWe producing electricity for sale, the unit shall become a CAIR NO_x unit as provided in paragraph (1)(A)1. of this rule on the first date on which it both combusts fossil fuel and serves such generator.

(B) The units in the state that meet the requirements set forth in subparagraph (1)(B)1.A., (1)(B)2.A., or (1)(B)2.B. of this rule shall not be CAIR NO_x units—

1. Cogenerator exemption.

A. Any unit that is a CAIR NO_x unit under paragraph (1)(A)1. or 2. of this rule—

(I) Qualifying as a cogeneration unit during the twelve (12)-month period starting on the date the unit first produces electricity and continuing to qualify as a cogeneration unit; and

(II) Not serving at any time, since the later of November 15, 1990 or the startup of the unit's combustion chamber, a generator with nameplate capacity of more than twenty-five (25) MWe supplying in any calendar year more than one-third of the unit's potential electric output capacity or two hundred nineteen thousand (219,000) megawatt hours (MWh), whichever is greater, to any utility power distribution system for sale.

B. If a unit qualifies as a cogeneration unit during the twelve (12)-month period starting on the date the unit first produces electricity and meets the requirements of subparagraph (1)(B)1.A. of this rule for at least one (1) calendar year, but subsequently no longer meets all such requirements, the unit shall become a CAIR NO_x unit starting on the earlier of January 1 after the first calendar year during which the unit first no longer qualifies as a cogeneration unit or January 1 after the first calendar year during which the unit no longer meets the requirements of part (1)(B)1.A.(II) of this rule.

2. Solid waste incinerator exemption.

A. Any unit that is a CAIR NO_x unit under paragraph (1)(A)1. or 2. of this rule commencing operation before January 1, 1985—

(I) Qualifying as a solid waste incineration unit; and

(II) With an average annual fuel consumption of non-fossil fuel for 1985–1987 exceeding eighty percent (80%) (on a British thermal unit (Btu) basis) and an average annual fuel consumption of non-fossil fuel for any three (3) consecutive calendar years after 1990 exceeding eighty percent (80%) (on a Btu basis).

B. Any unit that is a CAIR NO_x unit under paragraph (1)(A)1. or 2. of this rule commencing operation on or after January 1, 1985—

(I) Qualifying as a solid waste incineration unit; and

(II) With an average annual fuel consumption of non-fossil fuel for the first three (3) calendar years of operation exceeding eighty percent (80%) (on a Btu basis) and an average annual fuel consumption of non-fossil fuel for any three (3) consecutive calendar years after 1990 exceeding eighty percent (80%) (on a Btu basis).

C. If a unit qualifies as a solid waste incineration unit and meets the requirements of subparagraph (1)(B)2.A. or B. of this rule for at least three (3) consecutive calendar years, but subsequently no longer meets all such requirements, the unit shall become a CAIR NO_x unit starting on the earlier of January 1 after the first calendar year during which the unit first no longer qualifies as a solid waste incineration unit or January 1 after the first three (3) consecutive calendar years after 1990 for which the unit has an average annual fuel consumption of fossil fuel of twenty percent (20%) or more.

(C) Retired Unit Exemption. Unless otherwise noted in this section of the rule, all of the sections of 40 CFR 96.105 promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(2) Definitions.

(A) Definitions for key words and phrases used in this rule may be found in sections 40 CFR 96.102 and 96.103 of 40 CFR 96 subpart AA promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(B) Definitions of certain terms specified in this rule, other than those defined in this rule section, may be found in 10 CSR 10-6.020.

(3) General Provisions.

(A) Unless otherwise noted in this section of the rule, 40 CFR 96.106, 96.107, and 96.108 as well as all of the sections of 40 CFR 96 subparts BB, CC (excluding any reference to 40 CFR 96 subpart EE), DD, FF, GG, and II promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(B) NO_x Allowances.

1. Timing requirements for CAIR NO_x allowance allocations.

A. By October 31, 2006, the permitting authority will submit to the administrator the CAIR NO_x allowance allocations, in a format prescribed by the administrator, for the calendar years in 2009, 2010, 2011, 2012, 2013, and 2014 consistent with the allocations listed in Table I of this rule.

B. By October 31, 2006, the permitting authority will submit to the administrator the CAIR NO_x allowance allocations, in a format prescribed by the administrator, for the calendar year beginning 2015 and extending through ten (10) calendar years consistent with the allocations listed in Table I of this rule.

C. By October 31, 2015 and October 31 of every tenth year following, the permitting authority will submit to the administrator the CAIR NO_x allowance allocations, in a format prescribed by the administrator, for the calendar year ten (10) years in the future and extending through ten (10) calendar years consistent with the allocations listed in Table I of this rule.

2. NO_x allowance allocations.

A. The state trading program NO_x budget allocated by the director under subparagraphs (3)(B)2.B. and (3)(B)2.C. of this rule for a calendar year will equal fifty-nine thousand eight hundred seventy-one (59,871) tons for 2009–2014 and forty-nine thousand eight hundred ninety-two (49,892) tons for 2015 and beyond.

B. The following NO_x budget units shall be allocated NO_x allowances for each calendar year in accordance with Table I of paragraph (3)(B)2.B. of this rule.

_Table I

Facility ID	Facility Name	Unit ID	Portion Statewide Pool	NO_x Allocation 2009–2014	NO_x Allocation 2015 and Beyond

C. Any unit subject to section (1) of this rule other than those listed in Table I of this subsection will not be allocated NO_x budget allowances under this rule.

D. *Reserved.*

E. Any person seeking set-aside allowances for energy efficiency and renewable generation projects shall meet the requirements of subparagraph (3)(B)2.E. of this rule.

(I) The purpose for establishing this set-aside is to allocate allowances to serve as incentives for saving or generating electricity through the implementation of energy efficiency and renewable generation projects as defined in this section.

(a) Each energy efficiency and renewable generation set-aside shall contain the number of NO_x allowances as provided in Table I of this subsection.

(b) Awards of allowances will be available only to eligible energy efficiency or renewable generation projects that—

I. Commence operation after September 1, 2005;

II. Reduce electricity use, generate electricity from renewable resources or provide combined heat and power benefits during the twelve (12)-month energy efficiency/renewable energy project period of January 1, 2008 through December 31, 2008 or subsequent twelve (12)-month energy efficiency/renewable energy project periods; and

III. In an application submitted by March 1 of each year, include adequate documentation of these energy savings, renewable energy generation or combined heat and power benefits.

(c) Projects will be awarded allowances for the control period following the twelve (12)-month energy efficiency/
renewable energy project period during which the qualifying project activities took place. For example, sponsors of project activities that take place during the twelve (12)-month energy efficiency/renewable energy project period of January 1, 2008 through December 31, 2008 will receive allowances for the 2009 control period.

(d) Eligible projects located in Missouri may qualify for awards from the set-aside for up to seven (7) consecutive control periods. Eligible projects located outside Missouri may qualify for awards for up to five (5) consecutive control periods.

(e) Department actions on applications for awards from the set-aside. The department shall act upon applications as follows:

I. By May 31 of the control period for which NO_x allowances are requested, the department shall take the following actions:

a. For each application, the department shall determine whether the project is eligible and the application is complete and shall notify the applicant of its determination; and

b. For the eligible and complete applications, the department shall calculate the total number of allowances which the projects are qualified to receive, not to exceed the total number of allowances allocated to the set-aside as provided in Table I of this subsection, and shall award said allowances to eligible energy efficiency or renewable generation projects.

II. If the number of allowances awarded is fewer than allowances allocated to the set-aside as provided in Table I of this subsection, the department shall transfer surplus allowances to the accounts of the electric utilities listed in Table I of this subsection on a pro rata basis in the same proportion as allocations to NO_x budget units set forth in Table I of this subsection.

III. If the number of allowances claimed for award is more than allowances allocated to the set-aside as provided in Table I of this subsection, the department shall allocate awards to sponsors of eligible projects as follows:

a. Up to the first one hundred fifty (150) allowances in the set-aside shall be awarded for eligible projects located in Missouri, as follows. Up to the first sixty (60) allowances shall be awarded for eligible energy efficiency projects in the order that the projects first achieved eligible status. The remaining allowances shall be awarded for eligible projects located in Missouri in the order the projects first achieved eligible status, regardless of the type of project; and

b. The remaining allowances in the set-aside shall be awarded for eligible projects on a pro rata basis in proportion to total remaining claims for awards, regardless of project location.

(II) Project eligibility. Allocations from the energy efficiency and renewable generation set-aside may be requested by any entity, including an electric utility listed in Table I of this subsection or its affiliate, that implements and demonstrates eligible projects as defined in this subparagraph.

(a) Eligibility requirements. The department shall establish requirements for project eligibility and shall determine which projects are eligible to receive awards from the set-aside.

(b) Only the following shall be eligible for awards from the set-aside:

I. Energy efficiency projects resulting in reduced or more efficient electricity use through the voluntary installation, replacement, or modification of equipment, fixtures, or materials in a building or facility.

a. Energy efficiency projects may be directed toward or located within buildings or facilities owned, leased, operated or controlled by an electric utility listed in Table I of this subsection or its affiliate. Eligibility requirements for these projects shall be the same as for any other energy efficiency project.

b. Energy efficiency projects may include demand-side programs that result in reduced or more efficient electricity use;

II. Renewable generation projects, includes electric generation from wind, photovoltaic systems, biogas and hydropower projects. Renewable generation projects do not include nuclear power projects. Eligible biogas

projects include projects to generate electricity from methane gas captured from sanitary landfills, wastewater treatment plants, sewage treatment plants or agricultural livestock waste treatment systems. Eligible hydropower projects are restricted to systems—

a. That are certified by the Low Impact Hydropower Institute;

b. That employ a head of ten feet (10') or less; or

c. Employing a head greater than ten feet (10') that make use of a dam that existed prior to the effective date of this rule;

III. Renewable biomass generation projects include projects in which one (1) or more biomass fuels is fired separately or co-fired with one (1) or more fossil fuels to generate electricity. Biomass includes wood and wood waste, energy crops such as switchgrass and agricultural wastes such as crop and animal waste. Electric generation from combustion of municipal solid waste is not included; and

IV. Combined heat and power (CHP) projects that use integrated technologies, including cogeneration, which convert fuel to electric, thermal, and mechanical energy for on-site or local use. In the case of electricity generation, combined heat and power can include export of power to the local electric utility transmission grid. The thermal energy from combined heat and power systems can be created and used in the form of steam, hot or chilled water for process, space heating or cooling, or other applications. To be eligible, the combined heat and power installation must meet or exceed technology-specific efficiency thresholds that will be established by the department.

(c) Additional eligibility requirements shall include the following:

I. Project information must be submitted on forms provided by the department. After the effective date of this rule, any revision to the department-supplied forms will be presented to the regulated community for a forty-five (45)-day comment period;

II. Only projects that are not required by federal government regulation and that are not and will not be used to generate compliance or permitting credits otherwise in the state implementation plan (SIP) are eligible to receive allowances from the set-aside;

III. Only electricity generation or savings that are not the basis for an award of CAIR annual NO_x allowance from a set-aside in another state's CAIR annual NO_x rule can be the basis for a claim from the Missouri set-aside;

IV. Only projects that equal at least one (1) ton of NO_x emissions, using conventional arithmetic rounding, are eligible to receive allowances from the set-aside. Multiple projects may be aggregated into a single allowance allocation request to equal one (1) or more tons of NO_x emissions;

V. Only projects that commence operation after September 1, 2005, are eligible to receive allowances from the set-aside;

VI. Sponsors must establish a compliance account or general account in EPA's NO_x Allowance Tracking System (NATS). The application for an award from the set-aside must be submitted to the department by the CAIR authorized account representative or alternate CAIR authorized account representative for the compliance account or general account; and

VII. Location of eligible projects.

a. To be eligible, an energy efficiency project or combined heat and power project must be located within Missouri.

b. To be eligible, a renewable generation project or biomass generation project may be located within or outside of Missouri and must meet the following criteria:

(i) The number of allowances awarded to a renewable generation project or biomass generation project located within or outside of Missouri shall be calculated based on the amount of power the facility delivers to Missouri end-use customers. The sponsor must certify and demonstrate the amount of power from the renewable generation project or biomass generation project that is delivered to Missouri end-use customers; and

(ii) If the renewable generation project or biomass generation project is located outside of Missouri, the project must be sponsored by a Missouri electric generation and transmission cooperative, a Missouri electric distribution utility or the affiliate of a Missouri electric distribution utility. For the purpose of this rule, "affiliate" shall be defined as in 4 CSR 240-20.010.

(d) Pre-application project review. Sponsors of new energy efficiency/renewable energy projects must submit a request for pre-application project review by March 31 of the year prior to the control period for which set-aside awards will be claimed. For example, a project sponsor intending to apply for an award of 2009 control period allowances must request a pre-application project review by March 31, 2008, and may request the review at any time prior to that date. Pre-application project reviews will cover eligibility requirements and proposed measurement and verification procedures. The request for pre-application project review must be submitted on forms provided by the department. After the effective date of this rule, any revision to the department-supplied forms will be presented to the regulated community for a forty-five (45)-day comment period;

(e) Eligibility for any project may be claimed by only one (1) entity. The department shall determine procedures to be followed if multiple claims of eligibility for the same project are received.

(III) Applications and calculations of awards. To qualify for an award of allowances from the set-aside an applicant must meet the following requirements:

(a) The project must be eligible as provided in part (3)(B)2.E.(II) of this rule;

(b) By March 1 following the twelve (12)-month energy efficiency/renewable energy project period during which the eligible project activities occurred, the department must receive a complete application that meets the following requirements:

I. The application shall be prepared on forms provided by the department and must be submitted by the project's CAIR authorized account representative or alternate CAIR authorized account representative. After the effective date of this rule, any revision to the department-supplied forms will be presented to the regulated community for a forty-five (45)-day comment period;

II. The applicant must demonstrate electricity savings or renewable generation and calculate the NO_x allowance award requested using methods that adhere to measurement and verification standards approved by the department. The department shall have the right to require verification of data and calculations that are presented in an application as a condition for awarding allowances to the applicant. Verification may include site visits by agents of the department; and

III. If the applicant intends to reapply in subsequent years, the application must indicate the stream of benefits that is expected in subsequent years;

(c) The department shall determine methods for calculating awards of allowances based upon the following principles:

I. Allowances awarded to end-use electrical energy efficiency projects shall be calculated as the number of MWh of electricity saved during a twelve (12)-month energy efficiency/renewable energy project period multiplied by an emissions factor of 1.5 pounds of NO_x per MWh appropriately converted and rounded to tons using conventional arithmetic rounding. The department shall provide a factor to adjust the calculation of electricity saved to account for transmission and distribution line losses;

II. Allowances awarded to renewable generation projects from wind, photovoltaic systems, biogas and hydropower projects shall be calculated as the number of MWh of electricity generated during a twelve (12)-month energy efficiency/renewable energy project period multiplied by an emissions factor of 1.5 pounds of NO_x per MWh appropriately converted and rounded to tons using conventional arithmetic rounding;

III. Allowances awarded to renewable biomass generation projects shall be calculated based on net NO_x emission reductions, appropriately converted and rounded to tons using conventional arithmetic rounding where—

a. Net NO_x emissions shall be calculated as the number of MWh of electricity generated during a twelve (12)-month energy efficiency/renewable energy project period multiplied by an emissions factor of 1.5 pounds of NO_x per MWh, minus the tons of NO_x emitted by the renewable generating project during the twelve (12)-month energy efficiency/renewable energy project period; and

b. When biomass is co-fired with other fuels, its share of electric generation and NO_x emissions shall be calculated based on its share of the total heat content of all fuels used in the co-firing process; and

IV. Allowances awarded to combined heat and power (CHP) projects shall be calculated based on the difference between actual NO_x emissions from the CHP system and the NO_x emissions that would be emitted by an equivalent business-as-usual (BAU) system. An equivalent BAU system consists of a conventional power plant that produces electricity plus a conventional industrial boiler that produces useful heat (heat used for space, water or industrial process heat). The department shall provide efficiency and NO_x emission rates to be used in calculating NO_x emissions from the equivalent BAU system. In addition, to qualify for an award, a CHP system shall be required to achieve an efficiency threshold. The threshold shall be set by the department and the efficiency of the CHP system shall be calculated based on a method provided by the department; and

(d) The sponsor of a project located in Missouri that receives an award from the set-aside may reapply for set-aside awards for up to an additional six (6) consecutive control periods by meeting the following requirements. The sponsor of a project located outside of Missouri that receives an award from the set-aside may reapply for set-aside awards for up to an additional four (4) consecutive control periods by meeting the following requirements:

I. Reapplication must be received by March 1 following the last day of the twelve (12)-month energy efficiency/
renewable energy project period during which the energy efficiency and renewable electric generation activities took place; and

II. The reapplication must be prepared on forms provided by the department and must be submitted by the project's CAIR authorized account representative or alternate CAIR authorized account representative. After the effective date of this rule, any revision to the department-supplied forms will be presented to the regulated community for a forty-five (45)-day comment period;

3. Compliance supplement pool.

A. For any CAIR NO_x unit in the state that achieves NO_x emission reductions in 2007 and 2008 that are not necessary to comply with any state or federal emissions limitation applicable during such years, the CAIR designated representative of the unit may request early reduction credits, and allocation of CAIR NO_x allowance**s** from the compliance supplement pool in accordance with the following:

(I) The owners and operators of such CAIR NO_x unit shall monitor and report the NO_x emissions rate and the heat input of the unit in accordance with section (4) of this rule in each calendar year for which early reduction credit is requested;

(II) The CAIR designated representative of such CAIR NO_x unit shall submit to the permitting authority by May 1, 2009 a request, in a format specified by the permitting authority, for allocation of an amount of CAIR NO_x allowances from the compliance supplement pool not exceeding the sum of the amounts (in tons) of the unit's NO_x

emission reductions in 2007 and 2008 that are not necessary to comply with any state or federal emissions limitation applicable during such years, determined in accordance with section (4) of this rule; and

(III) For units subject to the Acid Rain Program that do not have an applicable NO_x emission limit, the Acid Rain Program NO_x emission rate limit that would have applied had the unit been limited by Acid Rain Program NO_x requirements or state emission rate limit shall be utilized to determine the number of potential CAIR NO_x allowances those units may receive.

B. For any CAIR NO_x unit in the state whose compliance with CAIR NO_x emissions limitation for the calendar year 2009 would create an undue risk to the reliability of electricity supply during such calendar year, the CAIR designated representative of the unit may request the allocation of CAIR NO_x allowances from the compliance supplement pool in accordance with the following:

(I) The CAIR designated representative of such CAIR NO_x unit shall submit to the permitting authority by May 1, 2009 a request, in a format specified by the permitting authority, for allocation of an amount of CAIR NO_x allowances from the compliance supplement pool not exceeding the minimum amount of CAIR NO_x allowances necessary to remove such undue risk to the reliability of electricity supply; and

(II) In the request under paragraph (3)(B)3. of this rule, the CAIR designated representative of such CAIR NO_x unit shall demonstrate that, in the absence of allocation to the unit of the amount of CAIR NO_x allowances requested, the unit's compliance with CAIR NO_x emissions limitation for the calendar year 2009 would create an undue risk to the reliability of electricity supply during such calendar year. This demonstration must include a showing that it would not be feasible for the owners and operators of the unit to:

(a) Obtain a sufficient amount of electricity from other electricity generation facilities, during the installation of control technology at the unit for compliance with the CAIR NO_x emissions limitation, to prevent such undue risk; or

(b) Obtain under subparagraphs (3)(B)3.A. and C. of this rule, or otherwise obtain, a sufficient amount of CAIR NO_x allowances to prevent such undue risk.

C. The permitting authority will review each request under subparagraphs (3)(B)3.A. and B. of this rule submitted by May 1, 2009 and will allocate CAIR NO_x allowances for the calendar year 2009 to CAIR NO_x units in the state and covered by such request as follows:

(I) Upon receipt of each such request, the permitting authority will make any necessary adjustments to the request to ensure that the amount of the CAIR NO_x allowances requested meets the requirements of subparagraph (3)(B)3.A. or B. of this rule;

(II) If the total amount of CAIR NO_x allowances in all requests (as adjusted under part (3)(B)3.C.(I) of this rule) is not more than nine thousand forty-four (9,044), the permitting authority will allocate to each CAIR NO_x unit covered by such requests the amount of CAIR NO_x allowances requested (as adjusted under part (3)(B)3.C.(I) of this rule); and

(III) If the total amount of CAIR NO_x allowances in all requests (as adjusted under part (3)(B)3.C.(I) of this rule) is more than nine thousand forty-four (9,044), the permitting authority will allocate CAIR NO_x allowances to each CAIR NO_x unit covered by such requests as follows:

(a) The compliance supplement pool shall be divided into two (2) pools of three thousand fifteen (3,015) allowances and six thousand twenty-nine (6,029) allowances each;

(b) Units located in Buchanan, Jackson or Jasper County that combust at least one hundred thousand (100,000) passenger tire equivalents in each of 2007 and 2008 shall be eligible to request CAIR NO_x allowances from the smaller pool;

(c) CAIR NO_x allowances from the smaller pool shall be allocated according to the following formula:

Unit's allocation = Unit's adjusted allocation × (3,015/Total adjusted allocations for eligible units)

Where:
"Unit's allocation" is the number of CAIR NO_x allowances allocated to the unit from the state's compliance supplement pool.
"Unit's adjusted allocation" is the amount of CAIR NO_x allowances requested for the unit under subparagraphs (3)(B)3.A. and B. of this rule, as adjusted under part (3)(B)3.C.(I) of this rule.
"Total adjusted allocations for eligible units" is the sum of the amounts of allocations requested under subparagraphs (3)(B)3.A. and B. of this rule, as adjusted under paragraph (3)(B)1. of this rule by the units identified in subpart (3)(B)3.C.(III)(b) of this rule.

(d) Units that receive CAIR NO_x allowances from the smaller portion of the compliance supplement pool shall not be eligible to receive CAIR NO_x allowances from the remaining portion of the compliance supplement pool; and

(e) Any CAIR NO_x allowances not allocated under subpart (3)(C)3.C. (III)(c) shall be added to the pool of six thousand twenty-nine (6,029) allowances and allocated according to the following formula:

Unit's allocation = Unit's adjusted allocation × ((6,029 + Remainder from first allocation)/Total adjusted allocations for eligible units)

Where:

“Unit’s allocation” is the number of CAIR NO_x allowances allocated to the unit from the state’s compliance supplement pool.
“Unit’s adjusted allocation” is the amount of CAIR NO_x allowances requested for the unit under subparagraphs (3)(B)3.A. and B. of this rule, as adjusted under part (3)(B)3.C.(I) of this rule.
“Remainder from first allocation” is the amount of CAIR NO_x allowances from the smaller pool not allocated under subparagraph (3)(C)3.C.
“Total adjusted allocations for eligible units” is the sum of the amounts of allocations requested for all units under subparagraphs (3)(B)3.A. and B. of this rule, as adjusted under part (3)(B)3.C.(I) of this rule by units that were not allocated CAIR NO_x allowances under subparagraph (3)(C)3.C. of this rule; and

4. By November 30, 2009, the permitting authority will determine, and submit to the administrator, the allocations under subparagraphs (3)(B)3.B. and (3)(B)3.C. of this rule; and

5. By January 1, 2010, the administrator will record the allocations under subparagraphs (3)(B)3.B. and (3)(B)3.C. of this rule.

(4) Reporting and Record Keeping. Unless otherwise noted in this section of the rule, all of the sections of 40 CFR 96 subpart HH promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(5) Test Methods. *(Not Applicable)*

AUTHORITY: section 643.050, RSMo 2000. Original rule filed Oct. 2, 2006, effective May 30, 2007.*

10 CSR 10-6.364 Clean Air Interstate Rule Seasonal NO_x Trading Program

PURPOSE: This rule adopts the U.S. Environmental Protection Agency's (EPA) regional trading program for nitrogen oxides, which was developed to meet the requirements of the Clean Air Interstate Rule. The evidence supporting the need for this proposed rulemaking, per section 536.016, RSMo, is the U.S. Environmental Protection Agency's Clean Air Interstate Rule published on May 12, 2005.

PUBLISHER'S NOTE: The secretary of state has determined that the publication of the entire text of the material which is incorporated by reference as a portion of this rule would be unduly cumbersome or expensive. This material as incorporated by reference in this rule shall be maintained by the agency at its headquarters and shall be made available to the public for inspection and copying at no more than the actual cost of reproduction. This note applies only to the reference material. The entire text of the rule is printed here.

(1) Applicability.

(A) Except as provided in subsection (1)(B) of this rule—

1. The following units in this state shall be Clean Air Interstate Rule (CAIR) nitrogen oxides (NO_x) Ozone Season units, and any source that includes one or more such units shall be a CAIR NO_x Ozone Season source, subject to the requirements of this rule: any stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the later of November 15, 1990 or the startup of the unit's combustion chamber, a generator with nameplate capacity of more than twenty-five (25) megawatts electric (MWe) producing electricity for sale; and

2. If a stationary boiler or stationary combustion turbine that, under paragraph (1)(A)1. of this rule, is not a CAIR NO_x Ozone Season unit begins to combust fossil fuel or to serve a generator with nameplate capacity of more than twenty-five (25) MWe producing electricity for sale, the unit shall become a CAIR NO_x Ozone Season unit as provided in paragraph (1)(A)1. of this rule on the first date on which it both combusts fossil fuel and serves such generator; or

3. Units in Bollinger, Butler, Cape Girardeau, Carter, Clark, Crawford, Dent, Dunklin, Franklin, Gasconade, Iron, Jefferson, Lewis, Lincoln, Madison, Marion, Mississippi, Montgomery, New Madrid, Oregon, Pemiscot, Perry, Pike, Ralls, Reynolds, Ripley, St. Charles, St. Francois, St. Louis, Ste. Genevieve, Scott, Shannon, Stoddard, Warren, Washington and Wayne counties and the City of St. Louis which are not CAIR NO_x Ozone Season units under paragraphs (1)(A)1., (1)(A)2. and (1)(B) shall be Clean Air Interstate Rule (CAIR) nitrogen oxides (NO_x) Ozone Season units, and any source that includes one (1) or more such units shall be a CAIR NO_x Ozone Season source if**—**

A. Electric generating units that serve a generator with a nameplate capacity greater than twenty-five megawatts (25 MW) and—

(I) For non-cogeneration units—

(a) Commenced operation before January 1, 1997, and served a generator producing electricity for sale under a firm contract to the electric grid during 1995 or 1996; or

(b) Commenced operation in 1997 or 1998 and served a generator producing electricity for sale under a firm contract to the electric grid during 1997 or 1998; or

(c) Commenced operation on or after January 1, 1999, and served or serves at any time a generator producing electricity for sale; and

(II) For cogeneration units—

(a) Commenced operation before January 1, 1997, and failed to qualify as an unaffected unit under 40 CFR 72.6(b)(4) for 1995 or 1996 under the Acid Rain Program; or

(b) Commenced operation in 1997 or 1998 and failed to qualify as an unaffected unit under 40 CFR 72.6(b)(4) for 1997 or 1998 under the Acid Rain Program; or

(c) Commenced operation on or after January 1, 1999, and failed or fails to qualify as an unaffected unit under 40 CFR 72.6(b)(4) for any year under the Acid Rain Program; and

B. Non-electric generating boilers, combined cycle systems, and combustion turbines that have a maximum design heat input greater than two hundred fifty (250) million British thermal units per hour (mmBtu/hr) and—

(I) For non-cogeneration units—

(a) Commenced operations before January 1, 1997, and did not serve a generator producing electricity for sale under a firm contract to the electric grid during 1995 or 1996; or

(b) Commenced operations in 1997 or 1998 and did not serve a generator producing electricity for sale under a firm contract to the electric grid during 1997 or 1998; or

(c) Commenced operation on or after January 1, 1999, and:

I. At no time served or serves a generator producing electricity for sale; or

II. At any time served or serves a generator with a nameplate capacity of twenty-five (25) MW or less producing electricity for sale, and with the potential to use no more than fifty percent (50%) of the potential electrical output capacity of the unit; and

(II) For cogeneration units—

(a) Commenced operation before January 1, 1997, and qualified as an unaffected unit under 40 CFR 72.6(b)(4) for 1995 or 1996 under the Acid Rain Program; or

(b) Commenced operation in 1997 or 1998 and qualified as an unaffected unit under 40 CFR 72.6(b)(4) for 1997 or 1998 under the Acid Rain Program; or

(c) Commenced operation on or after January 1, 1999, and qualified or qualifies as an unaffected unit under 40 CFR 72.6(b)(4) for each year under the Acid Rain Program.

(III) Exemptions. The director shall provide the administrator written notice of the issuance of any permit under section (3) of this rule and, upon request, a copy of the permit. Notwithstanding paragraph (1)(A)3. of this rule, a unit shall not be a CAIR NO_x Ozone Season unit if the unit has a federally enforceable permit that:

(a) Restricts the unit to burning only natural gas or fuel oil;

(b) Restricts the unit's operating hours to the number calculated by dividing twenty-five (25) tons of potential mass emissions by the unit's maximum potential hourly NO_x mass emissions;

(c) Requires that the unit's maximum potential NO_x mass emissions be calculated by multiplying the unit's maximum rated hourly heat input by the highest default NO_x emission rate applicable to the unit under 40 CFR 75.19(c), Table LM-2;

(d) Requires that the owner or operator of the unit shall retain at the source that includes the unit, for five (5) years, records demonstrating that the operating hours restriction, the fuel use restriction, and the other requirements of the permit related to these restrictions were met; and

(e) Requires that the owner or operator of the unit shall report the unit's hours of operation (treating any partial hour of operation as a whole hour of operation) during each control period to the director by November 1 of each year for which the unit is subject to the federally enforceable permit.

(IV) A CAIR NO_x Ozone Season unit may not qualify for an exemption unless the emissions after the exemption do not exceed the lesser of twenty-five (25) tons or the amount of allocations allocated to them. The owner or operator of a CAIR NO_x Ozone Season unit that is allocated CAIR NO_x Ozone Season allowances under section (3) of this rule, which requests an exemption under part (1)(A)3.B.III. of this rule, will surrender to the administrator the CAIR NO_x Ozone Season allowances for the control period after qualifying and every year after for which the exemption remains in place.

(V) Loss of exemption. If, for any control period, the unit does not comply with the fuel use restriction under subpart (1)(A)3.B.(III)(a) of this rule or the operating hours restriction subpart (1)(A)3.B.(III)(b) and subpart (1)(A)3.B.(III)(c) of this rule, or the fuel use or the operating hour restrictions are removed from the unit's federally enforceable permit or otherwise becomes no longer applicable, the unit shall be a NO_x budget unit, subject to the requirements of this rule. Such unit shall be treated as commencing operation and, for a unit under paragraph (1)(A)3. of this rule, commencing commercial operation on September 30 of the control period for which the fuel use restriction or the operating hours restriction is no longer applicable or during which the unit does not comply with the fuel use restriction or the operating hours restriction.

(B) The units in the state that meet the requirements set forth in subparagraph (1)(B)1.A., (1)(B)2.A., or (1)(B)2.B. of this rule shall not be CAIR NO_x Ozone Season units—

1. Cogenerator exemption.

A. Any unit that is a CAIR Ozone Season NO_x unit under paragraph (1)(A)1. or 2. of this rule—

(I) Qualifying as a cogeneration unit during the twelve (12)-month period starting on the date the unit first produces electricity and continuing to qualify as a cogeneration unit; and

(II) Not serving at any time, since the later of November 15, 1990 or the startup of the unit's combustion chamber, a generator with nameplate capacity of more than twenty-five (25) MWe supplying in any calendar year more than one-third of the unit's potential electric output capacity or two hundred nineteen thousand (219,000) megawatt hours (MWh), whichever is greater, to any utility power distribution system for sale.

B. If a unit qualifies as a cogeneration unit during the twelve (12)-month period starting on the date the unit first produces electricity and meets the requirements of subparagraph (1)(B)1.A. of this rule for at least one (1) calendar year, but subsequently no longer meets all such requirements, the unit shall become a CAIR Ozone Season NO_x unit starting on the earlier of January 1 after the first calendar year during which the unit first no longer qualifies as a cogeneration unit or January 1 after the first calendar year during which the unit no longer meets the requirements of part (1)(B)1.A.(I) of this rule.

2. Solid waste incinerator exemption.

A. Any unit that is a CAIR NO_x Ozone Season unit under paragraph (1)(A)1. or 2. of this rule commencing operation before January 1, 1985—

(I) Qualifying as a solid waste incineration unit; and

(II) With an average annual fuel consumption of non-fossil fuel for 1985–1987 exceeding eighty percent (80%)(on a Btu basis) and an average annual fuel consumption of non-fossil fuel for any three (3) consecutive calendar years after 1990 exceeding eighty percent (80%)(on a Btu basis).

B. Any unit that is a CAIR NO_x Ozone Season unit under paragraph (1)(A)1. or 2. of this rule commencing operation on or after January 1, 1985—

(I) Qualifying as a solid waste incineration unit; and

(II) With an average annual fuel consumption of non-fossil fuel for the first three (3) calendar years of operation exceeding eighty percent (80%)(on a Btu basis) and an average annual fuel consumption of non-fossil fuel for any three (3) consecutive calendar years after 1990 exceeding eighty percent (80%)(on a Btu basis).

C. If a unit qualifies as a solid waste incineration unit and meets the requirements of subparagraph (1)(B)2.A. or B. of this rule for at least three (3) consecutive calendar years, but subsequently no longer meets all such requirements, the unit shall become a CAIR NO_x Ozone Season unit starting on the earlier of January 1 after the first calendar year during which the unit first no longer qualifies as a solid waste incineration unit or January 1 after the first three (3)

consecutive calendar years after 1990 for which the unit has an average annual fuel consumption of fossil fuel of twenty percent (20%) or more.

(C) Retired Unit Exemption. Unless otherwise noted in this section of the rule, all of the sections of 40 CFR 96.305 promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(2) Definitions.

(A) Definitions for key words and phrases used in this rule may be found in sections 40 CFR 96.302 and 96.303 of 40 CFR 96 subpart AAAA promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(B) Definitions for key words and phrases used in paragraph (1)(A)3. of this rule may be found in sections 40 CFR 97.2 subpart A promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(C) Cogenerator—(for the purposes of paragraph (1)(A).3. of this rule) A cogeneration facility which:

1. For a unit that commenced construction on or prior to November 15, 1990, was constructed for the purpose of supplying equal to or less than one-third its potential electrical output capacity or equal to or less than two hundred nineteen thousand (219,000) MWe-hrs actual electric output on an annual basis to any utility power distribution system for sale (on a gross basis). If the purpose of construction is not known, the administrator will presume that actual operation from 1985 through 1987 is consistent with such purpose. However, if in any three (3) calendar year period after November 15, 1990, such unit sells to a utility power distribution system an annual average of more than one-third of its potential electrical output capacity and more than two hundred nineteen thousand (219,000) MWe-hrs actual electric output (on a gross basis), that unit shall be an affected unit, subject to the requirements of the Acid Rain Program; or

2. For units which commenced construction after November 15, 1990, supplies equal to or less than one-third its potential electrical output capacity or equal to or less than two hundred nineteen thousand (219,000) MWe-hrs actual electric output on an annual basis to any utility power distribution system for sale (on a gross basis). However, if in any three (3) calendar year period after November 15, 1990, such unit sells to a utility power distribution system an annual average of more than one-third of its potential electrical output capacity and more than two hundred nineteen thousand (219,000) MWe-hrs actual electric output (on a gross basis), that unit shall be an affected unit, subject to the requirements of the Acid Rain Program.

(D) Definitions of certain terms specified in this rule, other than those defined in this rule section, may be found in 10 CSR 10-6.020.

(3) General Provisions.

(A) Unless otherwise noted in this section, 40 CFR 96.306, 96.307, and 96.308 as well as all of the sections of 40 CFR 96 subparts BBBB, CCCC, DDDD, FFFF, GGGG, and IIII promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(B) CAIR NO_x Ozone Season Allowances.

1. Timing requirements for CAIR NO_x Ozone Season Allowance allocations.

A. By October 31, 2006, the permitting authority will submit to the administrator the CAIR NO_x Ozone Season Allowance allocations, in a format prescribed by the administrator, for the control periods in 2009, 2010, 2011, 2012, 2013, and 2014 consistent with the allocations established in Table I and Table II of this subsection.

B. By October 31, 2006, the permitting authority will submit to the administrator the CAIR NO_x Ozone Season Allowance allocations, in a format prescribed by the administrator, for the control period beginning 2015 and extending through ten (10) control periods consistent with the allocations established in Table I and Table II of this subsection.

C. By October 31, 2015 and October 31 of every tenth year following, the permitting authority will submit to the administrator CAIR NO_x Ozone Season Allowance allocations, in a format prescribed by the administrator, for the control period ten (10) years in the future and extending through ten (10) control periods consistent with Table I and Table II of this subsection.

2. CAIR NO_x Ozone Season Allowance allocations.

A. The state trading program NO_x budget allocated by the director under subparagraphs (3)(B)2.B. and (3)(B)2.C. of this rule for a control period will equal twenty-six thousand seven hundred thirty-seven (26,737) tons for 2009-2014 and twenty-two thousand two hundred ninety (22,290) tons for 2015 and beyond.

B. The following CAIR NO_x ozone season units shall be allocated NO_x allowances for each control period in accordance with Table I of subparagraph (3)(B)2.B. of this rule._

Table I

Facility ID	Facility Name	Unit ID	Portion Statewide Pool	NO_x Allocation 2009–2014	NO_x Allocation 2015 and beyond

C. The following existing non-electric generating unit (EGU) boilers shall be allocated NOx allowances for each control period in accordance with Table II of subparagraph (3)(E)2.C of this rule.

Table II

Non-EGUs Boilers Per Ozone Season	**Unit**	**NO_x Allocation per Unit Tons**
Anheuser Busch	6	14
Trigen Ashley Street Station Boiler	5	9
Trigen Ashley Street Station Boiler	6	36

D. Any unit subject to subsection (1)(B) of this rule, other than those listed in Tables I and II of this subsection, will not be allocated CAIR NO_x Ozone Season Allowances under this rule.

(4) Reporting and Record Keeping. Unless otherwise noted in this section, all of the sections of 40 CFR 96 subpart HHHH promulaged as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(5) Test Methods. *(Not Applicable)*

AUTHORITY: section 643.050, RSMo 2000. Original rule filed Oct. 2, 2006, effective May 30, 2007.

10 CSR 10-6.366 Clean Air Interstate Rule SO_2 Trading Program

PURPOSE: This rule adopts the U.S. Environmental Protection Agency's (EPA) regional trading program for sulfur dioxide, which was developed to meet the requirements of the Clean Air Interstate Rule. The evidence supporting the need for this proposed rulemaking, per section 536.016, RSMo, is the U.S. Environmental Protection Agency's Clean Air Interstate Rule published on May 12, 2005.

PUBLISHER'S NOTE: The secretary of state has determined that the publication of the entire text of the material which is incorporated by reference as a portion of this rule would be unduly cumbersome or expensive. This material as incorporated by reference in this rule shall be maintained by the agency at its headquarters and shall be made available to the public for inspection and copying at no more than the actual cost of reproduction. This note applies only to the reference material. The entire text of the rule is printed here.

(1) Applicability.

(A) Except as provided in subsection (1)(B) of this rule:

1. The following units in this state shall be Clean Air Interstate Rule (CAIR) sulfur dioxide (SO_2) units, and any source that includes one or more such units shall be a CAIR SO_2 source, subject to the requirements of this rule: any stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the later of November 15, 1990 or the startup of the unit's combustion chamber, a generator with nameplate capacity of more than twenty-five (25) megawatts electric (MWe) producing electricity for sale.

2. If a stationary boiler or stationary combustion turbine that, under paragraph (1)(A)1. of this rule, is not a CAIR SO_2 unit begins to combust fossil fuel or to serve a generator with nameplate capacity of more than twenty-five (25) MWe producing electricity for sale, the unit shall become a CAIR SO_2 unit as provided in paragraph (1)(A)1. of this rule on the first date on which it both combusts fossil fuel and serves such generator.

(B) The units in the state that meet the requirements set forth in subparagraph (1)(B)1.A., (1)(B)2.A., or (1)(B)2.B. of this rule shall not be CAIR SO_2 units:

1. Cogenerator exemption.

A. Any unit that is a CAIR SO_2 unit under paragraph (1)(A)1. or 2. of this rule—

(I) Qualifying as a cogeneration unit during the twelve (12)-month period starting on the date the unit first produces electricity and continuing to qualify as a cogeneration unit; and

(II) Not serving at any time, since the later of November 15, 1990 or the startup of the unit's combustion chamber, a generator with nameplate capacity of more than twenty-five (25) MWe supplying in any calendar year more than one-third of the unit's potential electric output capacity or two hundred nineteen thousand (219,000) megawatt hours (MWh), whichever is greater, to any utility power distribution system for sale.

B. If a unit qualifies as a cogeneration unit during the twelve (12)-month period starting on the date the unit first produces electricity and meets the requirements of subparagraph (1)(B)1.A. of this rule for at least one (1) calendar year, but subsequently no longer meets all such requirements, the unit shall become a CAIR SO_2 unit starting on the earlier of January 1 after the first calendar year during which the unit first no longer qualifies as a cogeneration unit or January 1 after the first calendar year during which the unit no longer meets the requirements of part (1)(B)1.A.(II) of this rule.

2. Solid waste incinerator exemption.

A. Any unit that is a CAIR SO_2 unit under paragraph (1)(A)1. or 2. of this rule commencing operation before January 1, 1985—

(I) Qualifying as a solid waste incineration unit; and

(II) With an average annual fuel consumption of non-fossil fuel for 1985–1987 exceeding eighty percent (80%) (on a British thermal unit (Btu) basis) and an average annual fuel consumption of non-fossil fuel for any three (3) consecutive calendar years after 1990 exceeding eighty percent (80%) (on a Btu basis).

B. Any unit that is a CAIR SO_2 unit under paragraph (1)(A)1. or 2. of this rule commencing operation on or after January 1, 1985—

(I) Qualifying as a solid waste incineration unit; and

(II) With an average annual fuel consumption of non-fossil fuel for the first three (3) calendar years of operation exceeding eighty percent (80%) (on a Btu basis) and an average annual fuel consumption of non-fossil fuel for any three (3) consecutive calendar years after 1990 exceeding eighty percent (80%) (on a Btu basis).

C. If a unit qualifies as a solid waste incineration unit and meets the requirements of subparagraph (1)(B)2.A. or B. of this rule for at least three (3) consecutive calendar years, but subsequently no longer meets all such requirements, the unit shall become a CAIR SO_2 unit starting on the earlier of January 1 after the first calendar year during which the unit first no longer qualifies as a solid waste incineration unit or January 1 after the first three (3) consecutive calendar years after 1990 for which the unit has an average annual fuel consumption of fossil fuel of twenty percent (20%) or more.

(C) Retired Unit Exemption. Unless otherwise noted in this section of the rule, all of the sections of 40 CFR 96.205 promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(2) Definitions.

(A) Definitions for key words and phrases used in this rule may be found in sections 40 CFR 96.202 and 96.203 of 40 CFR 96 subpart AAA promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(B) Definitions of certain terms specified in this rule, other than those defined in this rule section, may be found in 10 CSR 10-6.020.

(3) General Provisions. Unless otherwise noted in this section, 40 CFR 96.206, 96.207, and 96.208 as well as all of the sections of 40 CFR 96 subparts BBB, CCC, DDD, FFF, GGG, and III promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(4) Reporting and Record Keeping. Unless otherwise noted in this section, all of the sections of 40 CFR 96 subpart HHH promulgated as of April 28, 2006 are hereby incorporated by reference in this rule, as published by the Office of the Federal Register, U.S. National Archives and Records, 700 Pennsylvania Avenue NW, Washington, D.C. 20408. This rule does not incorporate any subsequent amendments or additions.

(5) Test Methods. *(Not Applicable)*

AUTHORITY: section 643.050, RSMo 2000. Original rule filed Oct. 2, 2006, effective May 30, 2007.

**Original authority: 643.050, RSMo 1965, amended 1972, 1992, 1993, 1995.*

10 CSR 10-6.350 Emission Limitations and Emissions Trading of Oxides of Nitrogen

PURPOSE: The purpose of this rule is to reduce the emissions of nitrogen oxides (NO_x) and establish a NO_x emissions trading program for the state of Missouri. The reductions in NO_x emissions will reduce the transport of ozone and its precursors within the state of Missouri and to other states as required under the Clean Air Act.

(1) Applicability.

(A) This rule applies to any fossil fuel-fired electric generating unit that serves a generator with a nameplate capacity of greater than twenty-five megawatts (25 MW).

(B) Exemptions.

1. Any unit under subsection (1)(A) of this rule which demonstrates, using the emission estimation methods outlined in paragraph (5)(E)1. of this rule, that the unit's mass NO_x emissions are twenty-five (25) tons or less during the control period is exempt from the requirements of this rule.

2. The provisions of section (3) of this rule shall not apply to any emergency standby generators, internal combustion engines and peaking combustion turbine units demonstrated to operate less than four hundred (400) hours per control period averaged over the three (3) most recent years of operation, which have installed and maintained in proper operation a nonresettable engine hour meter.

(C) Loss of Exemption. If the exemption limit in paragraph (1)(B)1. or (1)(B)2. of this rule is exceeded, the exemption shall not apply and the owner or operator must notify the staff director or designee within thirty (30) days. If the owner or operator can demonstrate to the staff director or designee that the exemption limit was exceeded due to emergency operations or uncontrollable circumstances, the exemption in paragraph (1)(B)1. or (1)(B)2. of this rule shall apply.

(D) Compliance with this rule shall not relieve any owner or operator of the responsibility to comply fully with applicable provisions of the Air Conservation Law and rules or any other requirements under local, state or federal law. Specifically, compliance with this rule shall not violate the permit conditions previously established under 10 CSR 10-6.060 or 10 CSR 10-6.065.

(E) Affected sources in the counties of Bollinger, Butler, Cape Girardeau, Carter, Clark, Crawford, Dent, Dunklin, Franklin, Gasconade, Iron, Jefferson, Lewis, Lincoln, Madison, Marion, Mississippi, Montgomery, New Madrid, Oregon, Pemiscot, Perry, Pike, Ralls, Reynolds, Ripley, St. Charles, St. Francois, St. Louis, Ste. Genevieve, Scott, Shannon, Stoddard, Warren, Washington and Wayne counties and the City of St. Louis may demonstrate compliance with the provisions of this rule using compliance with 10 CSR 10-6.360, provided that the emission rate of each unit does not exceed 0.25 or 0.18 pound per million British thermal units (mmBtu), whichever is applicable.

(F) The requirements of sections (3), (4), and (5) of this rule will not apply to the control period beginning in 2009 and any control period thereafter.

(2) Definitions.

(A) Definitions of certain terms in this rule, other than those specified in this rule section, may be found in 10 CSR 10-6.020.

(B) Account certificate of representation—The completed and signed submission for certifying the designation of a NO_x authorized account representative for an affected unit or a group of identified affected units who is authorized to represent the owners or operators of such unit or units and of the affected units at such source or sources with regard to matters under the NO_x trading program.

(C) Account number—The identification number given to each NO_x trading program account.

(D) Automated data acquisition and handling system—That component of the Continuous Emissions Monitoring System, or other emissions monitoring system approved for use by the department, designed to interpret and convert individual output signals from pollutant concentration monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required in this rule.

(E) Average emission rate—The simple average of the hourly NO_x emission rate as recorded by monitoring systems approved in section (5) of this rule.

(F) Boiler—An enclosed fossil or other fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

(G) Combined cycle system—A system comprised of one or more combustion turbines, heat recovery steam generators, and steam turbines configured to improve overall efficiency of electricity generation or steam production.

(H) Combustion turbine—An enclosed fossil or other fuel-fired device that is comprised of a compressor, a combustor, and a turbine, and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine.

(I) Common stack—A single flue through which emissions from two or more NO_x units are exhausted.

(J) Compliance account—A NO_x allow-ance tracking system account, established for an affected unit, in which the NO_x allowance allocations for the unit are initially recorded and in which are held NO_x allowances available for use by the unit for a control period for the purpose of meeting the unit's NO_x emission limitation.

(K) Continuous emissions monitoring system (CEMS)—The equipment required by this rule to sample, analyze, measure, and provide, by readings taken at least once every fifteen (15) minutes of the measured parameters, a permanent record of NO_x emissions, expressed in tons per hour for NO_x.

(L) Control period—The period beginning May 1 of a calendar year and ending on September 30 of the same calendar year.

(M) Cyclone EGU—An electric generating unit (EGU) with a fossil fuel-fired boiler consisting of one or more horizontal cylindrical barrels that utilize tangentially applied air to produce a swirling combustion pattern of coal and air.

(N) Early reduction credit (ERC)—NO_x emission reductions in the years 2000, 2001, 2002 and 2003 that are below the limits specified in subsection (3)(A) of this rule. ERCs will only be available for use during the years of 2004 and 2005. When calculating ERCs or performing calculations involving ERCs, ERCs shall always be rounded down to the nearest ton.

(O) Electric generating unit (EGU)—Any fossil fuel-fired boiler or turbine that serves an electrical generator with the potential to use more than fifty percent (50%) of the usable energy from the boiler or turbine to generate electricity.

(P) Emergency standby generator—A generator operated only during times of loss of primary power at the facility that is beyond the control of the owner or operator of the facility or during routine maintenance.

(Q) Fossil fuel—Natural gas, petroleum, coal, or any form of solid, liquid or gaseous fuel derived from such material.

(R) Fossil fuel-fired—With regard to a unit, the combustion of fossil fuel, alone or in combination with any other fuel, where fossil fuel is projected to comprise more than fifty percent (50%) of the annual heat input.

(S) Generator—A device that produces electricity.

(T) Heat input—The product (expressed as million British thermal units per hour) of the gross calorific value of the fuel (expressed as British thermal units per pound) and the fuel feed rate into a combustion device (expressed as pounds per hour), as measured, recorded and reported to the department by the NO_x authorized account representative and as determined by the director in accordance with this rule and does not include the heat derived from preheated combustion air, recirculated flue gases, or exhaust from other sources.

(U) Nameplate capacity—The maximum electrical generating output (expressed as megawatt) that a generator can sustain over a specified period of time when not restricted by seasonal or other deratings, as listed in the National Allowance Data Base (NADB) under the data field "NAMECAP" if the generator is listed in the NADB or as measured in accordance with the United States Department of Energy standards. For generators not listed in the NADB, the nameplate capacity shall be used.

(V) NO_x allowance—An authorization by the department under the NO_x trading program to emit one (1) ton of NO_x during the control period of the specified year or of any year thereafter.

(W) NO_x allowance tracking system—The system by which the director records allocations, deductions and transfers of NO_x allowances under the NO_x trading program.

(X) NO_x allowance transfer deadline—Close of business on December 31 following the control period or, if December 31 is not a business day, close of business on the first business day thereafter and is the deadline by which NO_x allowances may be submitted for recording in an affected unit's compliance account, or the overdraft account of the installation where the unit is located.

(Y) NO_x authorized account representative—The person who is authorized by the owners or operators of the unit to represent and legally bind each owner and operator in matters pertaining to the NO_x trading program.

(Z) NO_x emissions limitation—For an affected unit, the tonnage equivalent of the NO_x emissions rate available for compliance deduction for the unit and for a control period adjusted by any deductions of such NO_x allowances to account for actual utilization for the control period or to an account for excess emissions for a prior control period or to account for withdrawal from the NO_x trading program or for a change in regulatory status for an affected unit.

(AA) NO_x emission rate—The amount of NO_x emitted by a combustion unit in pounds per million British thermal units of heat input as recorded by monitoring devices approved in section (5) of this rule.

(BB) NO_x opt-in unit—An EGU whose owner or operator has requested to become an affected unit under the NO_x trading program and has been approved by the department.

(CC) NO_x unit—Any fossil fuel-fired stationary boiler, combustion turbine, internal combustion engine or combined cycle system.

(DD) Opt-in—To voluntarily become an affected unit under the NO_x trading program.

(EE) Overdraft account—The NO_x allowance tracking system account established by the director for each NO_x authorized account representative.

(FF) Passenger tire equivalent (PTE)—The weight of waste tires or parts of waste tires equivalent to the average weight of one (1) passenger tire. The average weight of one (1) passenger tire is equal to twenty (20) pounds.

(GG) Peaking combustion unit—A combustion turbine normally reserved for operation during the hours of highest daily, weekly, or seasonal loads.

(HH) Serial number—When referring to NO_x allowances, the unique identification number assigned to each NO_x allowance.

(II) Tire-derived fuel—The end product of a process that converts whole scrap tires into a specific chipped form capable of being used as fuel.

(JJ) Unit load—The total output of a unit in any control period produced by combusting a given heat input of fuel expressed in terms of the total electrical generation (expressed as megawatt) produced by the unit including generation for use within the plant, and/or in the case of a unit that uses heat input for purposes other than electrical generation, the total steam flow (lb/hr) produced by the unit, including steam for use by the unit.

(KK) Unit operating day—A calendar day in which a unit combusts any fuel.

(LL) Unit operating hour or hour of unit operation—Any hour or fraction of an hour during which a unit combusts fuel.

(MM) Utilization—The heat input (ex-pressed as million British thermal units per hour) for a unit.

(3) General Provisions.

(A) NO_x Emissions Limitations. Beginning May 1, 2004, the following NO_x emission rates shall apply:

1. EGUs located in the counties of Bollinger, Butler, Cape Girardeau, Carter, Clark, Crawford, Dent, Dunklin, Gasconade, Iron, Lewis, Lincoln, Madison, Marion, Mississippi, Montgomery, New Madrid, Oregon, Pemiscot, Perry, Phelps, Pike, Ralls, Reynolds, Ripley, St. Charles, St. Francois, Ste. Genevieve, Scott, Shannon, Stoddard, Warren, Washington and Wayne, shall limit emissions of NO_x to the more stringent of a rate of 0.25 lbs NO_x/million British thermal units per hour (mmBtu) of heat input during the control period or any applicable permitted NO_x limitation under 10 CSR 10-6.060.

2. EGUs located in the City of St. Louis and the counties of Franklin, Jefferson and St. Louis shall limit emissions of NO_x to the more stringent rate of 0.18 lbs NO_x/mmBtu of heat input during the control period, or any applicable permitted NO_x limitation under 10 CSR 10-6.060. For the purpose of calculating ERCs under subparagraph (3)(B)5.C. of this rule, the regulated NO_x emission rate (NO_xER_r) for units located in these areas shall be 0.25 lbs NO_x/mmBtu.

3. EGUs located in the counties of Buchanan, Jackson, Jasper, or Randolph shall limit emissions of NO_x to the more stringent rate of any applicable permitted NO_x limitation under 10 CSR 10-6.060 or the less stringent of:

A. 0.35 lbs NO_x/mmBtu of heat input during the control period; or

B. 0.68 lbs NO_x/mmBtu of heat input during the control period, provided that the unit is a cyclone EGU and burns tire-derived fuel in a quantity of at least one hundred thousand (100,000) PTEs per year. For installations with multiple cyclone EGUs, compliance with the one hundred thousand (100,000) PTE burned per year may also be based on the average number of PTEs burned per cyclone EGU.

4. EGUs located in any county not identified in paragraph (3)(A)1., (3)(A)2., or (3)(A)3. of this rule shall limit emissions of NO_x to the more stringent of a rate of 0.35 lbs NO_x/mmBtu of heat input during the control period or any applicable permitted NO_x limitation under 10 CSR 10-6.060.

5. In lieu of complying with the applicable emission limitations in paragraph (3)(A)1. through (3)(A)4. of this rule, any affected unit may comply through the NO_x emissions trading program under subsection (3)(B) of this rule.

(B) NO_x Emissions Trading Program.

1. NO_x authorized account representative. The NO_x authorized account representative shall have the responsibilities and meet the requirements identified in this subsection.

A. Each affected unit shall have only one NO_x authorized account representative with respect to all matters under the NO_x trading program. Each affected unit may have only one (1) alternate NO_x authorized account representative who may act on behalf of the NO_x authorized account representative.

B. A NO_x authorized account representative may be responsible for multiple units at an installation or within a system of installations with the same owner.

C. The department will act on a valid submission made on behalf of owners or operators of an affected unit only if the submission has been made, signed and certified by the NO_x authorized account representative or the alternate NO_x authorized account representative.

D. Each unit must submit an account certificate of representation no later than January 1, 2004 or December 31 of the year in which the rule becomes applicable for units installed after January 1, 2004.

2. NO_x allowance tracking system.

A. NO_x allowance tracking system accounts. The department will establish one (1) compliance account for each NO_x unit and one (1) overdraft account for each NO_x authorized account representative with one (1) or more NO_x units. Allocations of NO_x allowances pursuant to paragraphs (3)(B)3. or (3)(B)10. of this rule and deductions or transfers of NO_x allowances pursuant to paragraphs (3)(B)3., (3)(B)7., (3)(B)9., or (3)(B)10. of this rule will be recorded in the compliance accounts or overdraft accounts.

B. Establishment of accounts.

(I) Compliance accounts and overdraft accounts. Upon receipt of a complete account certificate of representation, the department will establish—

(a) A compliance account for each affected NO_x unit for which the account certificate of representation was submitted; and

(b) An overdraft account for each NO_x authorized account representative for which the account certificate of representation was submitted.

(II) Account identification. The department will assign a unique identifying number to each compliance account and each overdraft account.

C. Recording of NO_x allowance allocations.

(I) The department will record the NO_x allowances for the 2004 control period in the NO_x units' compliance accounts.

(II) Serial numbers for allocated NO_x allowances. The department will assign each NO_x allowance a unique identification number that will include digits identifying the year for which the NO_x allowance is allocated.

3. NO_x allowances.

A. Projected NO_x allowances.

(I) By March 1, 2004, the NO_x authorized account representative for each affected unit shall submit to the department a report containing the following:

(a) The projected control period NO_x emission rate for each affected unit;

(b) The average of the three (3) most recent control period heat inputs, unless those three (3) periods are not representative of normal operation; and

(c) A plan identifying the methodology for compliance with subsection (3)(A) of this rule.

(II) The department will review each report and make any amendments within fifteen (15) working days.

(III) The department will develop a summary of projected NO_x allowances on a unit by unit and statewide basis for distribution on or before May 1 of each year using Equation 1 of this rule.

Equation 1:

$$\frac{HIp \times ERp}{2000} = NOxALp$$

where:

HI_p =the projected control period heat input for each NO_x unit;

ER_p =the projected control period emission rate for each NO_x unit; and

NO_xAL_p =the projected NO_x allowance for each NO_x unit rounded down to the nearest ton (in tons).

B. Control period NO_x allowances.

(I) By October 31 following each control period, each NO_x authorized account representative shall submit to the department the actual total control period heat input and actual average emission rate in a compliance report consistent with requirements of section (4) of this rule for each affected NO_x unit.

(II) By November 15 following each control period, the department will issue a notice to each NO_x authorized account representative of the actual NO_x allowances recorded in the unit compliance account for each affected NO_x unit using Equation 2 of this rule.

Equation 2:

$$\frac{HIa \times Err}{2000} = NOxALa$$

where:

HI_a =the actual control period heat input for each NO_x unit;

ER_r =the allowable control period emission rate for each NO_x unit as determined in paragraphs (3)(A)1. through (3)(A)4. of this rule; and

NO_xAL_a =the actual NO_x allowance for each unit for the control period rounded down to the nearest ton (in tons).

4. Compliance. By the end of the NO_x allowance transfer deadline, each NO_x unit shall have sufficient NO_x allowances in their compliance account to allow for the deductions in subparagraph (3)(B)4.B. of this rule.

A. NO_x allowance transfer deadline. The NO_x allowances are available to be deducted for compliance with a unit's NO_x emissions limitation for a control period in a given year only if the NO_x allowances—

(I) Were allocated for a control period in a prior year or the same year; and

(II) Are held in the unit's compliance account or the unit's overdraft account as of the NO_x allowance transfer deadline for that control period.

B. Deductions for compliance.

(I) The director will deduct NO_x allowances to cover the unit's NO_x emissions for the control period—

(a) From the compliance account; and

(b) Only if no more NO_x allowances available under subparagraph (3)(B)4.A. of this rule remain in the compliance account, from the overdraft account. In deducting allowances for units from the overdraft account, the director will begin with the unit having the compliance account with the lowest NO_x Allowance Tracking System account number and end with the unit having the compliance account with the highest NO_x Allowance Tracking System account number.

(II) The director will deduct NO_x allowances until the number of NO_x allowances deducted for the control period equals the number of tons of NO_x emissions, determined in accordance with part (3)(B)4.B.(III) of this rule, from the unit for the control period for which compliance is being determined; or until no more NO_x allowances available under subparagraph (3)(B)4.A. of this rule remain in the respective account.

(III) For a NO_x unit that is allocated NO_x allowances under part (3)(B)3.B.(II) of this rule for a control period, the department will deduct NO_x allowances under subparagraph (3)(B)4.B. or (3)(B)4.E. of this rule to account for the actual utilization of the unit during the control period. The department will calculate the number of NO_x allowances to be deducted to account for the unit's actual utilization using Equation 3 of this rule.

Equation 3:

$$\Sigma HI_a \times ER_a = NO_xAL_d$$

where:

HI_a =the actual control period heat input for each NO_x unit;

ER_a =the actual control period emission rate for each NO_x unit; and

NO_xAL_d =the number of NO_x allowances that will be deducted from each NO_x unit's compliance account (rounded down to the nearest allowance).

C. Identification of NO_x allowances by serial number.

(I) The NO_x authorized account representative may identify by serial number the NO_x allowances to be deducted from the unit's compliance account under subparagraph (3)(B)4.B., (3)(B)4.D., or (3)(B)4.E. of this rule. Such identification will be made in the compliance certification report submitted in accordance with paragraph (4)(A)1. of this rule.

(II) The staff director will deduct NO_x allowances for a control period from the compliance account, in the absence of an identification or in the case of a partial identification of NO_x allowances by serial number under part (3)(B)4.C.(I) of this rule, or the overdraft account in the following order:

(a) Those NO_x allowances that were allocated for the control period to the unit under part (3)(B)3.B.(II) of this rule;

(b) Those NO_x allowances that were allocated for the control period to any unit and transferred and recorded in the account pursuant to paragraphs (3)(B)7. and (3)(B)8. of this rule, in order of their date of recording;

(c) Those NO_x allowances that were allocated for a prior control period to the unit under part (3)(B)3.B.(II) of this rule; and

(d) Those NO_x allowances that were allocated for a prior control period to any unit and transferred and recorded in the account pursuant to paragraphs (3)(B)7. and (3)(B)8. of this rule, in order of their date of recording.

D. Deductions for units sharing a common stack. In the case of units sharing a common stack and having emissions that are not separately monitored or apportioned in accordance with section (4) of this rule—

(I) The NO_x authorized account representative of the units shall identify the percentage of NO_x allowances to be deducted from each such unit's compliance account to cover the unit's share of NO_x emissions from the common stack for a control period. Such identification shall be made in the compliance certification report submitted in accordance with paragraph (4)(A)1. of this rule.

(II) Notwithstanding part (3)(B)4.B.(II) of this rule, the director will deduct NO_x allowances for each unit until the number of NO_x allowances deducted equals the unit's identified percentage (under part (3)(B)4.D.(I) of this rule) of the number of tons of NO_x emissions, as determined in accordance with section (4) of this rule, from the common stack for the control period for which compliance is being determined or, if no percentage is identified, an equal percentage for each unit, plus the number of allowances required for deduction to account for actual utilization under subparagraph (4)(A)1.G. of this rule for the control period.

E. The director will record in the appropriate compliance account or overdraft account all deductions from such an account pursuant to subparagraphs (3)(B)4.B. and (3)(B)4.D. of this rule.

5. Banking.

A. NO_x allowances may be banked for future use or transfer into a compliance account or an overdraft account, as follows:

(I) Any NO_x allowance that is held in a compliance account or an overdraft account, will remain in such account until the NO_x allowance is deducted or transferred under paragraphs (3)(B)4., (3)(B)5., (3)(B)6., or (3)(B)7. of this rule.

(II) The director will designate, as a banked NO_x allowance, any NO_x allowance that remains in a compliance account or an overdraft account after the director has made all deductions for a given control period from the compliance account or overdraft account pursuant to paragraph (3)(B)4. of this rule.

B. Each year, starting in 2005, after the director has completed the designation of banked NO_x allowances under part (3)(B)5.A.(II) of this rule and before May 1 of the year, the department will determine the extent to which banked NO_x allowances may be used for compliance in the control period for the current year, as follows:

(I) The director will determine the total number of banked NO_x allowances held in compliance accounts or overdraft accounts.

(II) If the total number of banked NO_x allowances determined, under part (3)(B)5.B.(I) of this rule, to be held in compliance accounts or overdraft accounts is less than or equal to ten percent (10%) of the sum of the NO_x trading program allocations for the previous control period, any banked NO_x allowance may be deducted for compliance in accordance with paragraph (3)(B)4. of this rule.

(III) If the total number of banked NO_x allowances determined, under part (3)(B)5.B.(I) of this rule, and held in compliance accounts or overdraft accounts exceeds ten percent (10%) of the sum of the state trading program allocations for the previous control period, any banked allowance may be deducted for compliance in accordance with paragraph (3)(B)4. of this rule, except as follows:

(a) The director will determine the adjustment factor using Equation 4 of this rule.

Equation 4:

$$AF = \frac{0.1 \times \sum NO_xAL_a}{\sum NO_xAL_b}$$

where:

AF =the adjustment factor;
$\sum NO_xAL_a$ =the sum of the statewide NO_x allowance allocated for the previous control period; and
$\sum NO_xAL_b$ =the sum of the banked NO_x allowances as determined under part (3)(B)5.B.(I) of this rule on January 1 of the current year;

(b) The director will determine the number of banked NO_x allowances in the account that may be deducted for compliance in accordance with paragraph (3)(B)4. of this rule using Equation 5 of this rule. Any banked NO_x allowances in excess of the product of Equation 5 may be deducted for compliance in accordance with paragraph (3)(B)4. of this rule, except that, if such NO_x allowances are used to make a deduction, two (2) such NO_x allowances must be deducted for each deduction of one (1) NO_x allowance required under paragraph (3)(B)4. of this rule.

Equation 5:

$$AF \times NO_xAL_b$$

where
AF =the adjustment factor calculated in Equation 4; and
NO_xAL_b =the number of NO_x allowances in a NO_x unit's account;

(IV) Geographic flow control.

(a) Banked NO_x allowances made available for use in parts (3)(B)5.B.(II) and (3)(B)5.B.(III) of this rule may be traded on a one to one (1:1) basis unless otherwise specified in subparts (3)(B)5.B.(IV)(b) and (3)(B)5.B.(IV)(c) of this rule.

(b) Banked NO_x allowances made available for use in parts (3)(B)5.B.(II) and (3)(B)5.B.(III) of this rule may be traded from the control region for which paragraphs (3)(A)3. and (3)(A)4. of this rule are applicable to the control region for which paragraph (3)(A)1. of this rule is applicable on a one and one-half to one (1.5:1) basis.

(c) Banked NO_x allowances made available for use in part (3)(B)5.B.(II) and (3)(B)5.B.(III) of this rule may be traded from the control region for which paragraphs (3)(A)1., (3)(A)3. and (3)(A)4. of this rule are applicable to the control region for which paragraph (3)(A)2. of this rule is applicable on a one and one-half to one (1.5:1) basis.

C. Early reductions. For any affected NO_x unit that reduces its NO_x emission rate in the 2000, 2001, 2002 or 2003 control period, the owner or operator of the unit may request early reduction credits, and the department will allocate ERCs by January 31 of each year to the unit in accordance with the following requirements.

(I) Each NO_x unit for which the owner or operator requests any ERCs under part (3)(B)5.C.(IV) of this rule shall monitor NO_x emissions in accordance with section (4) of this rule for each control period for which such ERCs are requested. The unit's monitoring system availability shall be not less than ninety percent (90%) during the control period, and the unit must not have been found to be in violation of any applicable state or federal emissions or emissions-related requirements.

(II) NO_x emission rate and heat input under parts (3)(B)5.C.(III) through (3)(B)5.C.(V) of this rule shall be determined in accordance with section (4) of this rule.

(III) Each NO_x unit for which the owner or operator requests any ERCs under part (3)(B)5.C.(IV) of this rule shall reduce its NO_x emission rate, for each control period for which ERCs are requested, to less than the applicable requirement of subsection (3)(A) of this rule.

(IV) The NO_x authorized account representative of a NO_x unit that meets the requirements of parts (3)(B)5.C.(I) and (3)(B)5.C.(III) of this rule may submit to the department a request for ERCs for the unit based on NO_x emission rate reductions made by the unit in the control period for 2000, 2001, 2002 or 2003 in accordance with part (3)(B)5.C.(III) of this rule.

(a) In the ERC request, the NO_x authorized account representative may request ERCs for such control period using Equation 6 of this rule.

Equation 6:

$$ERC = HI_a \times (NO_xER_r - NO_xER_a) \div 2000$$

where:

ERC =the ERCs accrued rounded down to the nearest ton of NO_x;

HI_a =the actual control period heat input for each NO_x unit;

NO_xER_r =the regulated NO_x emission rate as identified in paragraphs (3)(A)1. through (3)(A)4. of this rule; and

NO_xER_a =the actual control period emission rate for each NO_x unit.

(b) The ERC request must be submitted, in a format specified by the department, by October 31 of the year in which the NO_x emission rate reductions are made.

(V) The department will allocate NO_x allowances no later than January 31 to NO_x units meeting the requirements of parts (3)(B)5.C.(I) and (3)(B)5.C.(III) of this rule and covered by early reduction requests meeting the requirements of subpart (3)(B)5.C.(IV)(b) of this rule.

(VI) NO_x allowances recorded under part (3)(B)5.C.(V) of this rule may be deducted for compliance under paragraph (3)(B)3. of this rule for the control periods in 2004 or 2005. Notwithstanding subparagraph (3)(B)5.A. of this rule, the director will deduct as retired any NO_x allowance that is recorded under part (3)(B)5.C.(V) of this rule and is not deducted for compliance in accordance with paragraph (3)(B)3. of this rule for the control period in 2004 or 2005.

(VII) NO_x allowances recorded under part (3)(B)5.C.(V) of this rule are not treated as banked allowances in 2005 for the purposes of subparagraphs (3)(B)5.A. and (3)(B)5.B. of this rule.

(VIII) Compliance set-aside account.

(a) The department will establish a compliance set-aside account, which will contain fifty percent (50%) of the ERCs, rounded down to the nearest ton, that are issued in accordance with part (3)(B)5.C.(II) of this rule.

(b) Fifty percent (50%) of the ERCs, rounded down to the nearest ton, in the compliance set-aside account will be sold to the NO_x authorized account representatives that apply for the ERCs and can demonstrate that the ERCs will be used for compliance by a unit that is in a research, development or trial stage for new air pollution control technology. If less than fifty percent (50%) of the ERCs are needed for these units, the remainder will be sold in accordance with subpart (3)(B)5.C.(VIII)(c) of this rule.

(c) The remaining ERCs in the compliance set-aside account will be sold in the order of request.

(d) NO_x authorized account representatives must request all of the ERCs needed from the compliance set-aside account for the 2004 and 2005 control periods by February 28, 2004. The request for ERCs shall include the following information:

I. The owner and operator;

II. The NO_x authorized account representative;

III. The NO_x unit identification number and name;

IV. The number of ERCs being requested; and

V. The overdraft or compliance account number.

(e) The department shall set the market rate for ERCs by February 1, 2004. Market rate shall not be set at a value below five hundred dollars ($500) per ERC nor in excess of one thousand dollars ($1,000) per ERC, and shall be established based on the following in the order listed:

I. The average rate of exchange of NO_x credits and ERCs in the Missouri NO_x Emissions Trading Program; and

II. The most recent control cost data available.

(f) The department shall notify the successful purchasers of ERCs by April 1, 2004 and payment shall be made by the purchaser to the sellers by April 15, 2004 for ERCs purchased. Once payment has been received by the sellers, they shall notify the department and the appropriate ERCs shall be transferred to the appropriate account by May 1, 2004.

(g) The ERCs will be sold from the compliance set-aside account on a percentage basis. Each purchaser will purchase a portion of each seller's ERCs.

(h) Once the appropriate ERCs are transferred to the purchaser's account, the ERCs are non-transferrable.

(i) Any ERC allowances remaining in the compliance set-aside account after May 1, 2004, will be returned to the unit that generated the ERCs by May 15, 2004.

(IX) All ERCs will be retired on January 31, 2006.

6. Account error. The director may correct any error in any NO_x Allowance Tracking System account. Within ten (10) business days of making such correction, the director will notify the NO_x authorized account representative for the account. The NO_x authorized account representative will then have ten (10) business days to appeal the correction if they feel the correction was made in error.

7. NO_x allowance transfers. The NO_x authorized account representatives seeking the recording of a NO_x allowance transfer shall submit the transfer request to the director. To be considered correctly submitted, the NO_x allowance transfer shall include the following elements in a format specified by the director:

A. The numbers identifying both the transferor and transferee accounts;

B. A specification by serial number of each NO_x allowance to be transferred; and

C. The printed name and signature of the NO_x authorized account representative of the transferor account and the date signed.

8. Department recording.

A. Within five (5) business days of receiving a NO_x allowance transfer, except as provided in subparagraph (3)(B)9.B. of this rule, the department will record a NO_x allowance transfer by moving each NO_x allowance from the transferor account to the transferee account as specified by the request, provided that—

(I) The transfer is correctly submitted under paragraph (3)(B)8. of this rule;

(II) The transferor account includes each NO_x allowance identified by serial number in the transfer; and

(III) The transfer meets all other requirements of this paragraph.

B. A NO_x allowance transfer that is submitted for recording following the NO_x allowance transfer deadline and that includes any NO_x allowances allocated for a control period prior to or the same as the control period to which the NO_x allowance transfer deadline applies will not be recorded until after completion of the process of recording of NO_x allowance allocations of this rule.

C. Where a NO_x allowance transfer submitted for recording fails to meet the requirements of subparagraph (3)(B)7. of this rule, the department will not record such transfer.

9. Notification.

A. Notification of recording. Within five (5) business days of recording of a NO_x allowance transfer under paragraph (3)(B)8. of this rule, the department will notify each NO_x authorized account representative of the transfer in writing.

B. Notification of nonrecording. Within ten (10) business days of receipt of a NO_x allowance transfer that fails to meet the requirements of paragraph (3)(B)7. of this rule, the department will notify in writing the NO_x authorized account representatives of both accounts subject to the transfer of—

(I) A decision not to record the transfer; and

(II) The reasons for such nonrecording.

10. Individual EGU opt-ins. An EGU that is not an affected unit under subsection (1)(A) of this rule that vents all of its emissions to a stack may qualify to become a NO_x opt-in unit under this paragraph of this rule. A NO_x opt-in unit will not be allowed to participate in the NO_x trading program without prior approval.

A. A NO_x opt-in unit shall have a NO_x authorized account representative.

B. Request for initial NO_x opt-in. In order to request to opt-in to the trading program, the NO_x authorized account representative of the unit must submit to the department at any time the following:

(I) The projected NO_x emission rate for each affected unit;

(II) The average of the three (3) most recent years heat input on a monthly basis over the control period for each affected unit; and

(III) A plan detailing the methodology for compliance with paragraph (3)(B)10. of this rule.

C. The department will review the request and respond within ninety (90) days of the date of receipt of the request.

D. Request for opting-in to the NO_x trading program must be received by the department no later than February 1 of the same year as the control period that the NO_x opt-in unit requests to begin participation in the NO_x trading program.

E. The NO_x opt-in units shall establish a baseline heat input and a baseline NO_x emissions rate under the requirements of subsection (5)(G) of this rule. After calculating the baseline heat input and the baseline NO_x emissions rate for the NO_x opt-in unit, the department will notify the NO_x authorized account representative of the unit of the resulting baseline.

F. The established baseline shall be the regulated NO_x emission rate for the opt-in unit. The NO_x opt-in unit shall meet the same schedule as all NO_x units with respect to all deadlines and schedules. The allowances issued to the opt-in unit under this paragraph shall be calculated using Equation 7 of this rule.

Equation 7:

$$\frac{HIopt \times ERopt}{2000} = NOxALopt$$

where:

HI_{opt} =the actual control period heat input for the NO_x opt-in unit;

ER_{opt} =the baseline emission rate for the NO_x opt-in unit as determined under subsection (5)(F) of this rule; and

NO_xAL_{opt} =the actual NO_x allowances for the opt-in unit for the control period (in tons).

G. If at any time before the approval of a NO_x opt-in unit, the department determines that the unit does not qualify as a NO_x opt-in unit under this paragraph, the department will issue a denial of the NO_x opt-in request for the unit.

H. Withdrawal of NO_x opt-in request. A NO_x authorized account representative of a unit may withdraw its request to opt-in at any time prior to the approval for the NO_x opt-in unit. Once the request for a NO_x opt-in unit is withdrawn, a NO_x authorized account representative seeking to reapply must submit a new request for a NO_x opt-in unit under this subsection.

I. Effective date. The effective date of the initial NO_x opt-in shall be May 1 of the first control period starting after the approval of the NO_x opt-in unit by the department. The unit shall be a NO_x opt-in unit and an affected NO_x unit as of the effective date of the approval and be subject to the requirements of this rule.

J. Change in regulatory status. When a NO_x opt-in unit becomes an affected unit, the NO_x authorized account representative shall notify the department in writing of such change in the NO_x opt-in unit's regulatory status within thirty (30) days of such change.

K. Withdrawal from NO_x trading program. A NO_x opt-in unit may withdraw from the NO_x trading program if it meets the following requirements:

(I) To withdraw from the NO_x trading program, the NO_x authorized account representative of a NO_x opt-in unit shall submit to the department a request to withdraw effective as of a specified date prior to May 1 or after September 30. The submission shall be made no later than ninety (90) days prior to the requested effective date of withdrawal.

(II) Before a NO_x opt-in unit may withdraw from the NO_x trading program, the following conditions must be met.

(a) For the control period immediately before the withdrawal is to be effective, the NO_x authorized account representative must submit or must have submitted to the department an annual compliance certification report.

(b) If the NO_x opt-in unit has excess emissions for the control period immediately before the withdrawal is to be effective, the department will deduct from the NO_x opt-in unit's compliance account, or the overdraft account of the affected unit where the affected unit is located, the full amount required for the control period.

(III) A NO_x opt-in unit that withdraws from the NO_x trading program shall comply with all requirements under the NO_x trading program concerning all years for which such NO_x opt-in unit was a NO_x opt-in unit, even if such requirements must be complied with after the withdrawal takes effect.

(IV) Notification procedures shall be as follows:

(a) After the requirements for withdrawal under this paragraph have been met, the department will issue a notification to the NO_x authorized account representative of the NO_x opt-in unit of the acceptance of the withdrawal of the NO_x opt-in unit as of a specified effective date that is after such requirements have been met and that is prior to May 1 or after September 30.

(b) If the requirements for withdrawal under this paragraph have not been met, the department will issue a notification to the NO_x authorized account representative of the NO_x opt-in unit that the NO_x opt-in unit's request to withdraw is denied. If the NO_x opt-in unit's request to withdraw is denied, the NO_x opt-in unit shall remain subject to the requirements for a NO_x opt-in unit.

(V) A NO_x opt-in unit shall continue to be a NO_x opt-in unit until the effective date of the withdrawal.

(VI) Once a NO_x opt-in unit withdraws from the NO_x trading program, the NO_x authorized account representative may not submit another application for the NO_x opt-in unit prior to the date that is four (4) years after the date on which the withdrawal became effective.

11. Output based emissions trading of NO_x. *(Reserved)*

(4) Reporting and Record Keeping.

(A) Reporting.

1. A compliance certification report for each affected unit subject to section (3) of this rule shall be submitted to the department by October 31 following each control period. The report shall include:

A. The owner and operator;

B. The NO_x authorized account representative;

C. NO_x unit name, compliance and overdraft account numbers;

D. NO_x emission rate limitation (lb/mmBtu);

E. Actual NO_x emission rate (lb/mmBtu) for the control period;

F. Actual heat input (mmBtu) for the control period. The unit's total heat input for the control period in each year will be determined in accordance with section (5) of this rule; and

G. Actual NO_x mass emissions (tons) for the control period.

2. Reporting shall be based on the test methods identified in section (5) of this rule. Any unit with valid continuous emission montoring system (CEMS) data for the control period must use that data to determine compliance with the provisions of this rule. The owner or operator for each affected unit which performs non-CEMS testing to demonstrate compliance of a unit subject to section (3) of this rule shall submit:

A. A control period report identifying monthly fuel usage and monthly total heat input by December 31 of the same year as the control period; and

B. A written report of all stack tests completed after controls are effective to the department within sixty (60) days after completion of sample and data collection.

(B) Record Keeping.

1. Each owner or operator of an affected unit subject to section (3) of this rule shall maintain records of the following:

A. Total fuel consumed during the control period;

B. The total heat input for each emissions unit during the control period;

C. Reports of all stack testing conducted to meet the requirements of this rule;

D. All other data collected by a CEMS necessary to convert the monitoring data to the units of the applicable emission limitation;

E. All performance evaluations conducted in the past year;

F. All monitoring device calibration checks;

G. All monitoring system, monitoring device and performance testing measurements;

H. Records of adjustments and maintenance performed on monitoring systems and devices; and

I. A log identifying each period during which the CEMS or alternate procedure was inoperative, except for zero and span checks, and the nature of the repairs and adjustments performed to make the system operative.

2. All records must be kept on-site for a period of five (5) years and made available to the department upon request.

3. Each owner or operator of any gas- or oil-fired unit that qualifies for the low-emitter exemption in paragraph (1)(B)1. of this rule or the low hours of operation exemption in paragraph (1)(B)2. of this rule, shall maintain records of the total operating hours during which fuel is consumed for each emission unit during the control period. In the event that another record keeping schedule has been previously approved for the EGU and is included as an operating permit condition, the EGU may use that schedule to comply with this requirement.

(5) Test Methods and Monitoring. For units subject to this rule, the following requirements shall apply:

(A) Compliance shall be measured during the control period;

(B) All valid data shall be used for calculating NO_x emissions rates;

(C) Coal-Fired Units. Any coal-affected unit subject to this rule shall install, certify, operate, maintain, and quality assure a NO_x and diluent CEMS pursuant to the requirements in 40 CFR part 75;

(D) Non-Exempt Peaking Units. Any gas- or oil-fired peaking unit that is subject to the emission limitation or trading aspects of this rule shall:

1. Install, certify, operate, maintain, and quality assure a NO_x and diluent CEMS; or

2. Install, certify, operate, and quality assure fuel-metering equipment pursuant to 40 CFR part 75, Appendix D and shall establish a NO_x-to-load curve pursuant to 40 CFR part 75, Appendix E;

(E) Exempt Units.

1. The following hierarchy of methods may be used to determine if a unit qualifies for the low-emitter exemption in paragraph (1)(B)1. of this rule. If data is not available for an emission estimation method or an emission estimation method is impractical for a source, then the subsequent emission estimation method should be used in its place:

A. CEMS as specified in 10 CSR 10-6.110;

B. Stack tests as specified in 10 CSR 10-6.110;

C. Material/mass balance;

D. AP-42 (Environmental Protection Agency (EPA) Compilation of Emission Factors) or FIRE (Factor Information and Retrieval System) (as updated);

E. Other EPA documents as specified in 10 CSR 10-6.110;

F. Sound engineering calculations; or

G. Facilities shall obtain department pre-approval of emission estimation methods other than those listed in subparagraphs (5)(E)1.A. through (5)(E)1.F. of this rule before using such method to estimate emissions. In the event that such method has previously been approved for the EGU and included as an operating permit condition, the EGU may use that method to comply with this requirement.

2. Any gas- or oil-fired unit that qualifies for the low-emitter exemption in paragraph (1)(B)1. or the low hours of operation exemption in paragraph (1)(B)2. shall install and operate a non-resettable hour meter or determine the hours of operation for each emission unit during the control period. In the event that another monitoring method has previously been approved for the EGU and included as an operating permit condition, the EGU may use that method to comply with this requirement.

(F) Opt-In Units. Any unit that opts into the trading program, pursuant to paragraph (3)(B)10., shall be monitored consistent with the provisions of subsections (5)(D) and (5)(E) above. For the purpose of establishing the baseline allowance allocation, an opt-in unit shall install, certify, operate, maintain, and quality assure the monitoring device(s) and collect data for at least one (1) control season prior to submission of an opt-in application.

AUTHORITY: section 643.050, RSMo 2000. Original rule filed Feb. 15, 2000, effective Sept. 30, 2000. Amended: Filed Dec. 4, 2002, effective Aug. 30, 2003. Amended: Filed Oct. 2, 2006, effective May 30, 2007.*

*Original authority: 203.050, RSMo 1965, amended 1972, transferred to 643.050, RSMo 1986, amended 1992, 1993, 1995.

10 CSR 10-6.360 Control of NO_x Emissions From Electric Generating Units and Non-Electric Generating Boilers

PURPOSE: This rule reduces emissions of oxides of nitrogen (NO_x) to ensure compliance with the federal NO_x control plan to reduce the transport of air pollutants. The rule establishes an emission budget for large electric generating units and non-electric generating boilers. The evidence supporting the need for this proposed rulemaking, per section 536.016, RSMo, is the U.S. Environmental Protection Agency NO_x State Implementation Plan (SIP) Call dated April 21, 2004.

(1) Applicability.

(A) This rulemaking shall apply throughout Bollinger, Butler, Cape Girardeau, Carter, Clark, Crawford, Dent, Dunklin, Franklin, Gasconade, Iron, Jefferson, Lewis, Lincoln, Madison, Marion, Mississippi, Montgomery, New Madrid, Oregon, Pemiscot, Perry, Pike, Ralls, Reynolds, Ripley, St. Charles, St. Francois, St. Louis, Ste. Genevieve, Scott, Shannon, Stoddard, Warren, Washington and Wayne counties and the City of St. Louis.

(B) The following units shall be NO_x budget units, and any source that includes one (1) or more such units shall be a NO_x budget source, subject to the requirements of this rule:

1. Electric generating units that serve a generator with a nameplate capacity greater than twenty-five megawatts (25 MW) and—

A. For non-cogeneration units—

(I) Commenced operation before January 1, 1997, and served a generator producing electricity for sale under a firm contract to the electric grid during 1995 or 1996; or

(II) Commenced operation in 1997 or 1998 and served a generator producing electricity for sale under a firm contract to the electric grid during 1997 or 1998; or

(III) Commenced operation on or after January 1, 1999, and served or serves at any time a generator producing electricity for sale; and

B. For cogeneration units—

(I) Commenced operation before January 1, 1997, and failed to qualify as an unaffected unit under 40 CFR 72.6(b)(4) for 1995 or 1996 under the Acid Rain Program; or

(II) Commenced operation in 1997 or 1998 and failed to qualify as an unaffected unit under 40 CFR 72.6(b)(4) for 1997 or 1998 under the Acid Rain Program; or

(III) Commenced operation on or after January 1, 1999, and failed or fails to qualify as an unaffected unit under 40 CFR 72.6(b)(4) for any year under the Acid Rain Program; and

2. Non-electric generating boilers, combined cycle systems, and combustion turbines that have a maximum design heat input greater than two hundred fifty (250) million British thermal units per hour (mmBtu/hr) and—

A. For non-cogeneration units—

(I) Commenced operations before January 1, 1997, and did not serve a generator producing electricity for sale under a firm contract to the electric grid during 1995 or 1996; or

(II) Commenced operations in 1997 or 1998 and did not serve a generator producing electricity for sale under a firm contract to the electric grid during 1997 or 1998; or

(III) Commenced operation on or after January 1, 1999, and:

(a) At no time served or serves a generator producing electricity for sale; or

(b) At any time served or serves a generator with a nameplate capacity of twenty-five (25) MW or less producing electricity for sale, and with the potential to use no more than fifty percent (50%) of the potential electrical output capacity of the unit; and

B. For cogeneration units—

(I) Commenced operation before January 1, 1997, and qualified as an unaffected unit under 40 CFR 72.6(b)(4) for 1995 or 1996 under the Acid Rain Program; or

(II) Commenced operation in 1997 or 1998 and qualified as an unaffected unit under 40 CFR 72.6(b)(4) for 1997 or 1998 under the Acid Rain Program; or

(III) Commenced operation on or after January 1, 1999, and qualified or qualifies as an unaffected unit under 40 CFR 72.6(b)(4) for each year under the Acid Rain Program.

(C) Exemptions. The director shall provide the administrator written notice of the issuance of any permit under subsection (3)(C) of this rule and, upon request, a copy of the permit. Notwithstanding subsection (1)(A) of this rule, a unit shall not be a NO_x budget unit if the unit has a federally enforceable permit that:

1. Restricts the unit to burning only natural gas or fuel oil;

2. Restricts the unit's operating hours to the number calculated by dividing twenty-five (25) tons of potential mass emissions by the unit's maximum potential hourly NO_x mass emissions;

3. Requires that the unit's maximum potential NO_x mass emissions be calculated by multiplying the unit's maximum rated hourly heat input by the highest default NO_x emission rate applicable to the unit under 40 CFR 75.19(c), Table LM-2;

4. Requires that the owner or operator of the unit shall retain at the source that includes the unit, for five (5) years, records demonstrating that the operating hours restriction, the fuel use restriction, and the other requirements of the permit related to these restrictions were met; and

5. Requires that the owner or operator of the unit shall report the unit's hours of operation (treating any partial hour of operation as a whole hour of operation) during each control period to the director by November 1 of each year for which the unit is subject to the federally enforceable permit.

(D) Loss of Exemption. If, for any control period, the unit does not comply with the fuel use restriction under paragraph (1)(C)1. of this rule or the operating hours restriction under paragraphs (1)(C)2. and 3. of this rule, or the fuel use or the operating hour restrictions are removed from the unit's federally enforceable permit or otherwise becomes no longer applicable, the unit shall be a NO_x budget unit, subject to the requirements of this rule. Such unit shall be treated as commencing operation and, for a unit under paragraph (1)(B)1. of this rule, commencing commercial operation on September 30 of the control period for which the fuel use restriction or the operating hours restriction is no longer applicable or during which the unit does not comply with the fuel use restriction or the operating hours restriction.

(E) Retired Unit Exemption. This subsection applies to any NO_x budget unit that is permanently retired.

1. Standard provisions.

A. Any NO_x budget unit that is permanently retired shall be exempt from the NO_x budget trading program, except for the provision of subsection (1)(E), sections (1) and (2), subsections (3)(E), (3)(F) and (3)(G) of this rule.

B. The exemption under subparagraph (1)(E)1.A. of this rule shall become effective the day on which the unit is permanently retired. Within thirty (30) days of permanent retirement, the NO_x authorized account representative shall submit a statement to the director. A copy of the statement shall be submitted to the administrator. The statement shall state that the unit is permanently retired and will comply with the requirements of paragraph (1)(E)2. of this rule.

C. After receipt of the notice under subparagraph (1)(E)1.B. of this rule, the director will amend any permit covering the source at which the unit is located to add the provisions and requirements of the exemption under subparagraph (1)(E)1.A. and paragraph (1)(E)2. of this rule.

2. Special provisions.

A. A unit exempt under this subsection shall not emit any nitrogen oxides, starting on the date that the exemption takes effect.

B. The owners and operators and, to the extent applicable, the NO_x authorized account representative of a unit exempt under this section shall comply with the requirements of the NO_x budget trading program concerning all periods for which the exemption is not in effect, even if such requirements arise, or must be complied with, after the exemption takes effect.

C. *Reserved*

D. For a period of five (5) years from the date the records are created, the owners and operators of a unit exempt under this section shall retain, at the source that includes the unit, records demonstrating that the unit is permanently retired. The five (5)-year period for keeping records may be extended for cause, at any time prior to the end of the period, in writing by the director or the administrator. The owners and operators bear the burden of proof that the unit is permanently retired.

E. A unit exempt under subsection (1)(E) of this rule and located at a source that is required, except for this exemption, would be required to have a Title V or a non-Title V operating permit, shall not resume operation unless the NO_x authorized account representative of the source submits a complete NO_x budget permit application for the unit not less than eighteen (18) months prior to the later of May 1, 2007 or the date on which the unit is to first resume operation.

3. Loss of exemption. For the purpose of applying monitoring requirements under section (4) of this rule, a unit that loses its exemption under subsection (1)(E) of this rule shall be treated as a unit that commences operation or commercial operation on the first date on which the unit resumes operation. On the earlier of the following dates, a unit exempt under subsection (1)(E) of this rule shall lose its exemption:

A. The date on which the NO_x authorized account representative submits a NO_x budget permit application under subparagraph (1)(E)2.E. of this rule; or

B. The date on which the NO_x authorized account representative is required under subparagraph (1)(E)2.E. of this rule to submit a NO_x budget permit application.

(F) Compliance with this rule shall not relieve any owner or operator of the responsibility to comply fully with applicable provisions of the Air Conservation Law and rules or any other requirements under local, state or federal law. Specifically, compliance with this rule shall not violate the permit conditions previously established under 10 CSR 10-6.060 or 10 CSR 10-6.065.

(G) Computation of Time.

1. Unless otherwise stated, any time period scheduled under the NO_x budget trading program to begin on the occurrence of an act or event, shall begin on the day the act or event occurs.

2. Unless otherwise stated, any time period scheduled under the NO_x budget trading program to begin before the occurrence of an act or event, shall be computed so that the period ends the day before the act or event occurs.

3. Unless otherwise stated, if the final day of any time period under the NO_x budget trading program falls on a weekend or a state or federal holiday, the time period shall be extended to the next business day.

(H) The requirements of sections (3), (4) and (5) of this rule will not apply to the control period beginning in 2009 and any control period therafter.

(2) Definitions.

(A) Account certificate of representation—The completed and signed submission required by subsection (3)(B) of this rule for certifying the designation of a NO_x authorized account representative for a NO_x budget source or a group of identified NO_x budget sources who is authorized to represent the owners and operators of such source or sources and of the NO_x budget units at such source or sources with regard to matters under the NO_x budget trading program.

(B) Account number—The identification number given by the administrator to each NO_x allowance tracking system account.

(C) Acid rain emissions limitation—As defined in 40 CFR 72.2, a limitation on emissions of sulfur dioxide or nitrogen oxides under the Acid Rain Program under Title IV of the Clean Air Act.

(D) Administrator—The administrator of the United States Environmental Protection Agency or the administrator's duly authorized representative.

(E) Affiliate—Any person including an individual, corporation, service company, corporate subsidiary, firm, partnership, incorporated or unincorporated association, political subdivision including a public utility district, city, town, county, or a combination of political subdivisions, which directly or indirectly, through one (1) or more intermediaries, controls, is controlled by, or is under common control with the regulated electrical corporation.

(F) Allocate or allocation—The determination by the director or the administrator of the number of NO_x allowances to be initially credited to a NO_x budget unit or an allocation set-aside.

(G) Automated data acquisition and handling system (DAHS)—That component of the continuous emissions monitoring system (CEMS), or other emissions monitoring system approved for use under section (4) of this rule, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required in this rule.

(H) Boiler—An enclosed fossil or other fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

(I) CAA—The Clean Air Act, 42 U.S.C. 7401, as amended by Pub. L. No. 101-595 (November 15, 1990).

(J) Combined cycle system—A system comprised of one (1) or more combustion turbines, heat recovery steam generators, and steam turbines configured to improve overall efficiency of electricity generation or steam production.

(K) Combustion turbine—An enclosed fossil or other fuel-fired device that is comprised of a compressor, a combustor, and a turbine, and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine.

(L) Commence commercial operation—With regard to a unit that serves a generator, to have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation. Except as provided in subsection (1)(E) of this rule, for a unit that is a NO_x budget unit under section (1) of this rule on the date the unit commences commercial operation, such date shall remain the unit's date of commencement of commercial operation even if the unit is subsequently modified, reconstructed, or repowered. Except as provided in subsections (1)(E) or (3)(H) of this rule, for a unit that is not a NO_x budget unit under section (1) of this rule on the date the unit commences commercial operation, the date the unit becomes a NO_x budget unit under section (1) of this rule shall be the unit's date of commencement of commercial operation.

(M) Commence operation—To have begun any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber. Except as provided in subsection (1)(E) of this rule, for a unit that is a NO_x budget unit under section (1) of this rule on the date of commencement of operation, such date shall remain the unit's date of commencement of operation even if the unit is subsequently modified, reconstructed, or repowered. Except as provided in subsection (1)(E) of this rule or subsection (3)(H) of this rule, for a unit that is not a NO_x budget unit under section (1) of this rule on the date of commencement of operation, the date the unit becomes a NO_x budget unit under section (1) of this rule shall be the unit's date of commencement of operation.

(N) Common stack—A single flue through which emissions from two (2) or more units are exhausted.

(O) Compliance account—NO_x allowance tracking system account, established by the administrator for a NO_x budget unit under subsection (3)(F) of this rule, in which the NO_x allowance allocations for the unit are initially recorded and in which are held NO_x allowances available for use by the unit for a control period for the purpose of meeting the unit's NO_x emissions limitation.

(P) Compliance certification—A submission to the director or the administrator, that is required under subsection (3)(D) of this rule to report a NO_x budget source's or a NO_x budget unit's compliance or noncompliance with this part and that is signed by the NO_x authorized account representative in accordance with subsection (3)(B) of this rule.

(Q) Continuous emissions monitoring system (CEMS)—The equipment required under section (4) of this rule to sample, analyze, measure, and provide, by readings taken at least once every fifteen (15) minutes of the measured parameters, a permanent record of nitrogen oxides emissions, expressed in tons per hour for nitrogen oxides. The following systems are component parts included, consistent with 40 CFR 75, in a continuous emissions monitoring system:

1. Flow monitor;
2. Nitrogen oxides pollutant concentration monitors;
3. Diluent gas monitor (oxygen or carbon dioxide) when such monitoring is required by section (4) of this rule;
4. A continuous moisture monitor when such monitoring is required by section (4) of this rule; and
5. An automated data acquisition and handling system.

(R) Control period—The period beginning May 1 of a calendar year and ending on September 30 of the same calendar year.

(S) Emissions—Air pollutants exhausted from a unit or source into the atmosphere, as measured, recorded, and reported to the administrator by the NO_x authorized account representative and as determined by the administrator in accordance with section (4) of this rule.

(T) Energy Information Administration—The Energy Information Administration of the United States Department of Energy.

(U) Fossil fuel—Natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

(V) Fossil fuel-fired—With regard to a unit, the combustion of fossil fuel, alone or in combination with any other fuel, where fossil fuel—

1. Actually combusted comprises more than fifty percent (50%) of the annual heat input on a Btu basis during any year starting in 1995 or, if a unit had no heat input starting in 1995, during the last year of operation of the unit prior to 1995; or

2. Is projected to comprise more than fifty percent (50%) of the annual heat input on a Btu basis during any year; provided that the unit shall be "fossil fuel-fired" as of the date, during such year, on which the unit begins combusting fossil fuel.

(W) General account—A NO_x allowance tracking system account, established under subsection (3)(F) of this rule, that is not a compliance account or an overdraft account.

(X) Generator—A device that produces electricity.

(Y) Heat input—The product (in mmBtu/time) of the gross calorific value of the fuel (in Btu/lb) and the fuel feed rate into a combustion device (in mass of fuel/time), as measured, recorded, and reported to the administrator by the NO_x authorized account representative and as determined by the administrator in accordance with section (4) of this rule, and does not include the heat derived from preheated combustion air, recirculated flue gases, or exhaust from other sources.

(Z) Life-of-the-unit, firm power contractual arrangement—A unit participation power sales agreement under which a utility or industrial customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity and associated energy from any specified unit and pays its proportional amount of such unit's total costs, pursuant to a contract—

1. For the life of the unit;

2. For a cumulative term of no less than thirty (30) years, including contracts that permit an election for early termination; or

3. For a period equal to or greater than twenty-five (25) years or seventy percent (70%) of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period.

(AA) Maximum design heat input—The ability of a unit to combust a stated maximum amount of fuel per hour on a steady state basis, as determined by the physical design and physical characteristics of the unit.

(BB) Maximum potential hourly heat input—An hourly heat input used for reporting purposes when a unit lacks certified monitors to report heat input. If the unit intends to use Appendix D of 40 CFR 75 to report heat input, this value should be calculated, in accordance with 40 CFR 75, using the maximum fuel flow rate and the maximum gross calorific value. If the unit intends to use a flow monitor and a diluent gas monitor, this value should be reported, in accordance with 40 CFR 75, using the maximum potential flow rate and either the maximum carbon dioxide concentration (in percent CO_2) or the minimum oxygen concentration (in percent O_2).

(CC) Maximum potential NO_x emission rate—The NO_x emission rate of nitrogen oxides (in lb/mmBtu) calculated in accordance with section 3 of Appendix F of 40 CFR 75, using the maximum potential nitrogen oxides concentration as defined in section 2 of Appendix A of 40 CFR 75, and either the maximum oxygen concentration (in percent O_2) or the minimum carbon dioxide concentration (in percent CO_2), under all operating conditions of the unit except for unit start-up, shutdown, and upsets.

(DD) Maximum rated hourly heat input—A unit-specific maximum hourly heat input (mmBtu) which is the higher of the manufacturer's maximum rated hourly heat input or the highest observed hourly heat input.

(EE) Monitoring system—Any monitoring system that meets the requirements of section (4) of this rule, including a continuous emissions monitoring system, an excepted monitoring system, or an alternative monitoring system.

(FF) Nameplate capacity—The maximum electrical generating output (in MW) that a generator can sustain over a specified period of time when not restricted by seasonal or other deratings as measured in accordance with the United States Department of Energy standards.

(GG) Non-Title V permit—A federally enforceable permit administered by the director pursuant to the CAA and regulatory authority under the CAA, other than Title V of the CAA and 40 CFR 70 or 40 CFR 71.

(HH) NO_x allowance—An authorization by the department or the administrator under the NO_x budget trading program to emit up to one (1) ton of nitrogen oxides during the control period of the specified year or of any year thereafter.

(II) NO_x allowance deduction or deduct NO_x allowances—The permanent withdrawal of NO_x allowances by the administrator from a NO_x allowance tracking system compliance account or overdraft account to account for the number of tons of emissions from a NO_x budget unit for a control period, determined in accordance with section (4) of this rule, or for any other NO_x allowance surrender obligation under this part.

(JJ) NO_x allowances held or hold NO_x allowances—The NO_x allowances recorded by the administrator, or submitted to the administrator for recordation, in accordance with subsections (3)(F) and (G) of this rule, in a NO_x allowance tracking system account.

(KK) NO_x allowance tracking system—The system by which the administrator records allocations, deductions, and transfers of NO_x allowances under the NO_x budget trading program.

(LL) NO_x allowance tracking system account—An account in the NO_x allowance tracking system established by the administrator for purposes of recording the allocation, holding, transferring, or deducting of NO_x allowances.

(MM) NO_x allowance transfer deadline—Midnight of November 30 or, if November 30 is not a business day, midnight of the first business day thereafter and is the deadline by which NO_x allowances may be submitted for recordation in a NO_x budget unit's compliance account, or the overdraft account of the source where the unit is located, in order to meet the unit's NO_x budget emissions limitation for the control period immediately preceding such deadline.

(NN) NO_x authorized account representative—For a NO_x budget source or NO_x budget unit at the source, the natural person who is authorized by the owners and operators of the source and all NO_x budget units at the source, in accordance with subsection (3)(B) of this rule, to represent and legally bind each owner and operator in matters pertaining to the NO_x budget trading program or, for a general account, the natural person who is authorized, in accordance with subsection (3)(F) of this rule, to transfer or otherwise dispose of NO_x allowances held in the general account.

(OO) NO_x budget emissions limitation—For a NO_x budget unit, the tonnage equivalent of the NO_x allowances available for compliance deduction for the unit and for a control period under subparagraph (3)(F)5.A. or B. of this rule for the control period or to account for excess emissions for a prior control period under subparagraph (3)(F)5.D. of this rule or to account for withdrawal from the NO_x budget program.

(PP) NO_x budget permit—The legally binding and federally enforceable written document, or portion of such document, issued by the director, including any permit revisions, specifying the NO_x budget trading program requirements applicable to a NO_x budget source, to each NO_x budget unit at the NO_x budget source, and to the owners and operators and the NO_x authorized account representative of the NO_x budget source and each NO_x budget unit.

(QQ) NO_x budget source—A source that includes one (1) or more NO_x budget units.

(RR) NO_x budget trading program—A multi-state nitrogen oxides air pollution control and emission reduction program established in accordance with this rule and pursuant to 40 CFR 51.121, as a means of mitigating the interstate transport of ozone and nitrogen oxides, an ozone precursor.

(SS) NO_x budget unit—A unit that is subject to the NO_x budget trading program emissions limitation under section (1) or paragraph (3)(H)1. of this rule.

(TT) Operating—With regard to a unit under part (3)(C)3.D.(II) and paragraph (3)(H)1. of this rule, having documented heat input for more than eight hundred seventy-six (876) hours in the six (6) months immediately preceding the submission of an application for an initial NO_x budget permit under subparagraph (3)(H)4.A. of this rule.

(UU) Operator—Any person who operates, controls, or supervises a NO_x budget unit, or a NO_x budget source and shall include, but not be limited to, any holding company, utility system, or plant manager of such a unit or source.

(VV) Overdraft account—The NO_x allowance tracking system account, established by the administrator under subsection (3)(F) of this rule, for each NO_x budget source where there are two (2) or more NO_x budget units.

(WW) Owner—Any of the following persons:

1. Any holder of any portion of the legal or equitable title in a NO_x budget unit;
2. Any holder of a leasehold interest in a NO_x budget unit;
3. Any purchaser of power from a NO_x budget unit under a life-of-the-unit, firm power contractual arrangement. However, unless expressly provided for in a leasehold agreement, owner shall not include a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based, either directly or indirectly, upon the revenues or income from the NO_x budget unit; or
4. With respect to any general account, any person who has an ownership interest with respect to the NO_x allowances held in the general account and who is subject to the binding agreement for the NO_x authorized account representative to represent that person's ownership interest with respect to NO_x allowances.

(XX) Receive or receipt of—When referring to the director or the administrator, to come into possession of a document, information, or correspondence (whether sent in writing or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the director or the administrator in the regular course of business.

(YY) Recordation, record, or recorded—With regard to NO_x allowances, the movement of NO_x allowances by the administrator from one (1) NO_x allowance tracking system account to another, for purposes of allocation, transfer, or deduction.

(ZZ) Reference method—Any direct test method of sampling and analyzing for an air pollutant as specified in Appendix A of 40 CFR 60.

(AAA) Serial number—When referring to NO_x allowances, the unique identification number assigned to each NO_x allowance by the administrator, under subparagraph (3)(F)4.C. of this rule.

(BBB) Source—Any governmental, institutional, commercial, or industrial structure, installation, plant, building, or facility that emits or has the potential to emit any regulated air pollutant under the CAA. For purposes of section 502(c) of the CAA, a "source," including a "source" with multiple units, shall be considered a single "facility."

(CCC) State—One (1) of the forty-eight (48) contiguous states and the District of Columbia specified in 40 CFR 51.121, or any non-federal authority in or including such states or the District of Columbia (including local agencies, and statewide agencies) or any eligible Indian tribe in an area of such state or the District of Columbia, that adopts a NO_x budget trading program pursuant to 40 CFR 51.121. To the extent a state incorporates by reference the provisions of this part, the term "state" shall mean the incorporating state. The term "state" shall have its conventional meaning where such meaning is clear from the context.

(DDD) State trading program NO_x budget—The total number of tons apportioned to all NO_x budget units in a given state, in accordance with the NO_x budget trading program, for use in a given control period.

(EEE) Submit or serve—To send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation—

1. In person;

2. By United States Postal Service; or

3. By other means of dispatch or transmission and delivery. Compliance with any "submission," "service," or "mailing" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

(FFF) Title V operating permit—A permit issued under Title V of the CAA and 40 CFR 70 or 40 CFR 71.

(GGG) Title V operating permit regulations—The regulations that the administrator has approved or issued as meeting the requirements of Title V of the CAA and 40 CFR 70 or 40 CFR 71.

(HHH) Ton or tonnage—Any "short ton" (i.e., two thousand (2,000) pounds). For the purpose of determining compliance with the NO_x budget emissions limitation, total tons for a control period shall be calculated as the sum of all recorded hourly emissions (or the tonnage equivalent of the recorded hourly emissions rates) in accordance with section (4) of this rule, with any remaining fraction of a ton equal to or greater than 0.50 ton deemed to equal one (1) ton and any fraction of a ton less than 0.50 ton deemed to equal zero tons.

(III) Unit—a fossil fuel-fired stationary boiler, combustion turbine, or combined cycle system.

(JJJ) Unit load—The total (i.e., gross) output of a unit in any control period (or other specified time period) produced by combusting a given heat input of fuel, expressed in terms of:

1. The total electrical generation (MW) produced by the unit, including generation for use within the plant; or

2. In the case of a unit that uses heat input for purposes other than electrical generation, the total steam pressure (psia) produced by the unit, including steam for use by the unit.

(KKK) Unit operating day—A calendar day in which a unit combusts any fuel.

(LLL) Unit operating hour or hour of unit operation—Any hour or fraction of an hour during which a unit combusts fuel.

(MMM) Utilization—The heat input (expressed in mmBtu/time) for a unit. The unit's total heat input for the control period in each year will be determined in accordance with 40 CFR 75 if the NO_x budget unit was otherwise subject to the requirements of 40 CFR 75 for the year, or will be based on the best available data reported to the administrator for the unit if the unit was not otherwise subject to the requirements of 40 CFR 75 for the year.

(NNN) Definitions of certain terms specified in this rule, other than those defined in this rule section, may be found in 10 CSR 10-6.020.

(3) General Provisions.

(A) Standard Requirements.

1. Permit requirements.

A. The NO_x authorized account representative of each NO_x budget source required to have a federally enforceable permit and each NO_x budget unit required to have a federally enforceable permit at the source shall:

(I) Submit to the director a complete NO_x budget permit application under paragraph (3)(C)3. of this rule in accordance with the deadlines specified in subparagraphs (3)(C)2.B. and C. of this rule; and

(II) Submit in a timely manner any supplemental information that the director determines is necessary in order to review a NO_x budget permit application and issue or deny a NO_x budget permit.

B. The owners and operators of each NO_x budget source required to have a federally enforceable permit and each NO_x budget unit required to have a federally enforceable permit at the source shall have a NO_x budget permit issued by the director and operate the unit in compliance with such NO_x budget permit.

C. The owners and operators of a NO_x budget source that is not otherwise required to have a federally enforceable permit are not required to submit a NO_x budget permit application, and to have a NO_x budget permit, under subsection (3)(C) of this rule for such NO_x budget source.

2. Monitoring requirements.

A. The owners and operators and, to the extent applicable, the NO_x authorized account representative of each NO_x budget source and each NO_x budget unit at the source shall comply with the monitoring requirements of section (4) of this rule.

B. The emissions measurements recorded and reported in accordance with section (4) of this rule shall be used to determine compliance by the unit with the NO_x budget emissions limitation under paragraph (3)(A)3. of this rule.

3. Nitrogen oxides requirements.

A. The owners and operators of each NO_x budget source and each NO_x budget unit at the source shall hold NO_x allowances available for compliance deductions under paragraph (3)(F)5. of this rule, as of the NO_x allowance transfer deadline, in the unit's compliance account and the source's overdraft account in an amount not less than the total emissions for the control period from the unit, as determined in accordance with section (4) of this rule.

B. Each ton of nitrogen oxides emitted in excess of the NO_x budget emissions limitation shall constitute a separate violation of this rule, the CAA, and applicable state law.

C. A NO_x budget unit shall be subject to the requirements under subparagraph (3)(A)3.A. of this rule starting on the later of May 1, 2007 or the date on which the unit commences operation.

D. NO_x allowances shall be held in, deducted from, or transferred among NO_x allowance tracking system accounts in accordance with subsections (3)(E), (F), (G), and (H) of this rule.

E. A NO_x allowance shall not be deducted, in order to comply with the requirements under subparagraph (3)(A)3.A. of this rule, for a control period in a year prior to the year for which the NO_x allowance was allocated.

F. A NO_x allowance allocated by the director or the administrator under the NO_x budget trading program is a limited authorization to emit one (1) ton of nitrogen oxides in accordance with the NO_x budget trading program. No provision of the NO_x budget trading program, the NO_x budget permit application, the NO_x budget permit, or an exemption under subsection (1)(E) of this rule and no provision of law shall be construed to limit the authority of the United States or the state to terminate or limit such authorization.

G. A NO_x allowance allocated by the director or the administrator under the NO_x budget trading program does not constitute a property right.

H. Upon recordation by the administrator under subsections (3)(F), (G), or (H) of this rule, every allocation, transfer, or deduction of a NO_x allowance to or from a NO_x budget unit's compliance account or the overdraft account of the source where the unit is located is deemed to amend automatically, and become a part of, any NO_x budget permit of the NO_x budget unit by operation of law without any further review.

4. Excess emissions requirements. The owners and operators of a NO_x budget unit that has excess emissions in any control period shall:

A. Surrender the NO_x allowances required for deduction under part (3)(F)5.D.(I) of this rule; and

B. Pay any fine, penalty, or assessment or comply with any other remedy imposed under part (3)(F)5.D.(III) of this rule.

5. Record keeping and reporting requirements.

A. Unless otherwise provided, the owners and operators of the NO_x budget source and each NO_x budget unit at the source shall keep on-site at the source each of the following documents for a period of five (5) years from the date the document is created. This period may be extended for cause, at any time prior to the end of five (5) years, in writing by the director or the administrator.

(I) The account certificate of representation for the NO_x authorized account representative for the source and each NO_x budget unit at the source and all documents that demonstrate the truth of the statements in the account certificate of representation, in accordance with paragraph (3)(B)4.; provided that the certificate and documents shall be retained on-site at the source beyond such five (5)-year period until such documents are superseded because of the submission of a new account certificate of representation changing the NO_x authorized account representative.

(II) All emissions monitoring information, in accordance with section (4) of this rule; provided that to the extent that section (4) of this rule provides for a three (3)-year period for record keeping, the three (3)-year period shall apply.

(III) Copies of all reports, compliance certifications, and other submissions and all records made or required under the NO_x budget trading program.

(IV) Copies of all documents used to complete a NO_x budget permit application and any other submission under the NO_x budget trading program or to demonstrate compliance with the requirements of the NO_x budget trading program.

B. The NO_x authorized account representative of a NO_x budget source and each NO_x budget unit at the source shall submit the reports and compliance certifications required under the NO_x budget trading program, including those under subsections (3)(D), (3)(H), or section (4) of this rule.

6. Liability.

A. Any person who knowingly violates any requirement or prohibition of the NO_x budget trading program, a NO_x budget permit, or an exemption under subsection (1)(E) of this rule shall be subject to enforcement pursuant to applicable state or federal law.

B. Any person who knowingly makes a false material statement in any record, submission, or report under the NO_x budget trading program shall be subject to criminal enforcement pursuant to the applicable state or federal law.

C. No permit revision shall excuse any violation of the requirements of the NO_x budget trading program that occurs prior to the date that the revision takes effect.

D. Each NO_x budget source and each NO_x budget unit shall meet the requirements of the NO_x budget trading program.

E. Any provision of the NO_x budget trading program that applies to a NO_x budget source (including a provision applicable to the NO_x authorized account representative of a NO_x budget source) shall also apply to the owners and operators of such source and of the NO_x budget units at the source.

F. Any provision of the NO_x budget trading program that applies to a NO_x budget unit (including a provision applicable to the NO_x authorized account representative of a NO_x budget unit) shall also apply to the owners and operators of such unit. Except with regard to the requirements applicable to units with a common stack under section (4) of this rule, the owners and operators and the NO_x authorized account representative of one NO_x budget unit shall not be liable for any violation by any other NO_x budget unit of which they are not owners or operators or the NO_x authorized account representative and that is located at a source of which they are not owners or operators or the NO_x authorized account representative.

7. Effect on other authorities. No provision of the NO_x budget trading program, a NO_x budget permit application, a NO_x budget permit, or an exemption under subsection (1)(E) of this rule shall be construed as exempting or excluding the owners and operators and, to the extent applicable, the NO_x authorized account representative of a NO_x budget source or NO_x budget unit from compliance with any other provision of the applicable, approved state implementation plan, a federally enforceable permit, or the CAA.

(B) NO_x Authorized Account Representative for NO_x Budget Sources.

1. Responsibilities of the NO_x authorized account representative.

A. Except as provided under paragraph (3)(B)2. of this rule, each NO_x budget source, including all NO_x budget units at the source, shall have one (1) and only one (1) NO_x authorized account representative, with regard to all matters under the NO_x budget trading program concerning the source or any NO_x budget unit at the source.

B. The NO_x authorized account representative of the NO_x budget source shall be selected by an agreement binding on the owners and operators of the source and all NO_x budget units at the source.

C. Upon receipt by the administrator of a complete account certificate of representation under paragraph (3)(B)4. of this rule, the NO_x authorized account representative of the source shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each owner and operator of the NO_x budget source represented and each NO_x budget unit at the source in all matters pertaining to the NO_x budget trading program, not withstanding any agreement between the NO_x authorized account representative and such owners and operators. The owners and operators shall be bound by any decision or order issued to the NO_x authorized account representative by the director, the administrator, or a court regarding the source or unit.

D. No NO_x budget permit shall be issued, and no NO_x allowance tracking system account shall be established for a NO_x budget unit at a source, until the administrator has received a complete account certificate of representation under paragraph (3)(B)4. of this rule for a NO_x authorized account representative of the source and the NO_x budget units at the source.

E. NO_x budget trading program submissions.

(I) Each submission under the NO_x budget trading program shall be submitted, signed, and certified by the NO_x authorized account representative for each NO_x budget source on behalf of which the submission is made. Each such submission shall include the following certification statement by the NO_x authorized account representative: "I am authorized to make this submission on behalf of the owners and operators of the NO_x budget sources or NO_x budget units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(II) The director and the administrator will accept or act on a submission made on behalf of owner or operators of a NO_x budget source or a NO_x budget unit only if the submission has been made, signed, and certified in accordance with part (3)(B)1.E.(I) of this rule.

2. Alternate NO_x authorized account representative.

A. An account certificate of representation may designate one (1) and only one (1) alternate NO_x authorized account representative who may act on behalf of the NO_x authorized account representative. The agreement by which the alternate NO_x authorized account representative is selected shall include a procedure for authorizing the alternate NO_x authorized account representative to act in lieu of the NO_x authorized account representative.

B. Upon receipt by the administrator of a complete account certificate of representation under paragraph (3)(B)4. of this rule, any representation, action, inaction, or submission by the alternate NO_x authorized account representative shall be deemed to be a representation, action, inaction, or submission by the NO_x authorized account representative.

C. Except in paragraphs (3)(B)2. through 4., (3)(F)2. and subparagraph (3)(B)1.A. of this rule, whenever the term "NO_x authorized account representative" is used in this part, the term shall be construed to include the alternate NO_x authorized account representative.

3. Changing the NO_x authorized account representative and the alternate NO_x authorized account representative; changes in the owners and operators.

A. Changing the NO_x authorized account representative. The NO_x authorized account representative may be changed at any time upon receipt by the administrator of a superseding complete account certificate of representation under paragraph (3)(B)4. of this rule. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous NO_x authorized account representative prior to the time and date when the administrator receives the superseding account certificate of representation shall be binding on the new NO_x authorized account representative and the owners and operators of the NO_x budget source and the NO_x budget units at the source.

B. Changing the alternate NO_x authorized account representative. The alternate NO_x authorized account representative may be changed at any time upon receipt by the administrator of a superseding complete account certificate of representation under paragraph (3)(B)4. of this rule. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate NO_x authorized account representative prior to the time and date when the administrator receives the superseding account certificate of representation shall be binding on the new alternate NO_x authorized account representative and the owners and operators of the NO_x budget source and the NO_x budget units at the source.

C. Changes in the owners and operators.

(I) In the event a new owner or operator of a NO_x budget source or a NO_x budget unit is not included in the list of owners and operators submitted in the account certificate of representation, such new owner or operator shall be deemed to be subject to and bound by the account certificate of representation, the representations, actions, inactions, and submissions of the NO_x authorized account representative and any alternate NO_x authorized account representative of the source or unit, and the decisions, orders, actions, and inactions of the director or the administrator, as if the new owner or operator were included in such list.

(II) Within thirty (30) days following any change in the owners or operators of a NO_x budget source or a NO_x budget unit, including the addition of a new owner or operator, the NO_x authorized account representative or alternate NO_x authorized account representative shall submit a revision to the account certificate of representation amending the list of owners and operators to include the change.

4. Account certificate of representation.

A. A complete account certificate of representation for a NO_x authorized account representative or an alternate NO_x authorized account representative shall include the following elements in a format prescribed by the administrator:

(I) Identification of the NO_x budget source and each NO_x budget unit at the source for which the account certificate of representation is submitted.

(II) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the NO_x authorized account representative and any alternate NO_x authorized account representative.

(III) A list of the owners and operators of the NO_x budget source and of each NO_x budget unit at the source.

(IV) The following certification statement by the NO_x authorized account representative and any alternate NO_x authorized account representative: "I certify that I was selected as the NO_x authorized account representative or alternate NO_x authorized account representative, as applicable, by an agreement binding on the owners and operators of the NO_x budget source and each NO_x budget unit at the source. I certify that I have all the necessary authority to carry out my duties and responsibilities under the NO_x budget trading program on behalf of the owners and operators of the NO_x budget source and of each NO_x budget unit at the source and that each such owner and operator shall be fully bound by my representations, actions, inactions, or submissions and by any decision or order issued to me by the director, the administrator, or a court regarding the source or unit."

(V) The signature of the NO_x authorized account representative and any alternate NO_x authorized account representative and the dates signed.

B. Unless otherwise required by the director or the administrator, documents of agreement referred to in the account certificate of representation shall not be submitted to the director or the administrator. Neither the director nor the administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

5. Objections concerning the NO_x authorized account representative.

A. Once a complete account certificate of representation under paragraph (3)(B)4. of this rule has been submitted and received, the director and the administrator will rely on the account certificate of representation unless and until a superseding complete account certificate of representation under paragraph (3)(B)4. of this rule is received by the administrator.

B. Except as provided in subparagraph (3)(B)3.A. or B. of this rule, no objection or other communication submitted to the director or the administrator concerning the authorization, or any representation, action, inaction, or submission of the NO_x authorized account representative shall affect any representation, action, inaction, or submission of the NO_x authorized account representative or the finality of any decision or order by the director or the administrator under the NO_x budget trading program.

C. Neither the director nor the administrator will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any NO_x authorized account representative, including private legal disputes concerning the proceeds of NO_x allowance transfers.

(C) NO_x Budget Permits.

1. General NO_x budget trading program permit requirements.

A. For each NO_x budget source required to have a federally enforceable permit, such permit shall include a NO_x budget permit administered by the director.

(I) For NO_x budget sources required to have a Title V operating permit, the NO_x budget portion of the Title V permit shall be administered in accordance with the director's Title V operating permits regulations promulgated under 40 CFR 70 or 71, except as provided otherwise by subsection (3)(C) or (H) of this rule.

(II) For NO_x budget sources required to have a non-Title V permit, the NO_x budget portion of the non-Title V permit shall be administered in accordance with the director's regulations promulgated to administer non-Title V permits, except as provided otherwise by subsection (3)(C) or (H) of this rule.

B. Each NO_x budget permit (including a draft or proposed NO_x budget permit, if applicable) shall contain all applicable NO_x budget trading program requirements and shall be a complete and segregable portion of the permit under subparagraph (3)(C)1.A. of this rule.

2. Submission of NO_x budget permit applications.

A. The NO_x authorized account representative of any NO_x budget source required to have a federally enforceable permit shall submit to the director a complete NO_x budget permit application under paragraph (3)(C)3. of this rule by the applicable deadline in subparagraph (3)(C)3.B. of this rule.

B. Application time.

(I) For NO_x budget sources required to have a Title V operating permit:

(a) For any source, with one (1) or more NO_x budget units under section (1) of this rule that commence operation before January 1, 2006, the NO_x authorized account representative shall submit a complete NO_x budget permit application under paragraph (3)(C)3. of this rule covering such NO_x budget units to the director at least eighteen (18) months (or such lesser time provided under the director's Title V operating permits regulations for final action on a permit application) before May 1, 2007.

(b) For any source, with any NO_x budget unit under section (1) of this rule that commences operation on or after January 1, 2006, the NO_x authorized account representative shall submit a complete NO_x budget permit application under paragraph (3)(C)3. of this rule covering such NO_x budget unit to the director at least eighteen (18) months (or such lesser time provided under the director's Title V operating permits regulations for final action on a permit application) before the later of May 1, 2007 or the date on which the NO_x budget unit commences operation.

(II) For NO_x budget sources required to have a non-Title V permit:

(a) For any source, with one (1) or more NO_x budget units under section (1) of this rule that commence operation before January 1, 2006, the NO_x authorized account representative shall submit a complete NO_x budget permit application under paragraph (3)(C)3. of this rule covering such NO_x budget units to the director at least eighteen (18) months (or such lesser time provided under the director's non-Title V permits regulations for final action on a permit application) before May 1, 2007.

(b) For any source, with any NO_x budget unit under section (1) of this rule that commences operation on or after January 1, 2006, the NO_x authorized account representative shall submit a complete NO_x budget permit application under paragraph (3)(C)3. of this rule covering such NO_x budget unit to the director at least eighteen (18) months (or such lesser time provided under the director's non-Title V permits regulations for final action on a permit application) before the later of May 1, 2007 or the date on which the NO_x budget unit commences operation.

C. Duty to reapply.

(I) For a NO_x budget source required to have a Title V operating permit, the NO_x authorized account representative shall submit a complete NO_x budget permit application under paragraph (3)(C)3. of this rule for the NO_x budget source covering the NO_x budget units at the source in accordance with the director's Title V operating permits regulations addressing operating permit renewal.

(II) For a NO_x budget source required to have a non-Title V permit, the NO_x authorized account representative shall submit a complete NO_x budget permit application under paragraph (3)(C)3. of this rule for the NO_x budget source covering the NO_x budget units at the source in accordance with the director's non-Title V permits regulations addressing permit renewal.

3. Information requirements for NO_x budget permit applications. A complete NO_x budget permit application shall include the following elements concerning the NO_x budget source for which the application is submitted, in a format prescribed by the director:

A. Identification of the NO_x budget source, including plant name and the Office of Regulatory Information Systems (ORIS) or facility code assigned to the source by the Energy Information Administration, if applicable;

B. Identification of each NO_x budget unit at the NO_x budget source and whether it is a NO_x budget unit under section (1) of this rule or under subsection (3)(H) of this rule; and

C. The standard requirements under subsection (3)(A) of this rule.

4. NO_x budget permit contents.

A. Each NO_x budget permit (including any draft or proposed NO_x budget permit, if applicable) will contain, in a format prescribed by the director, all elements required for a complete NO_x budget permit application under paragraph (3)(C)3. of this rule as approved or adjusted by the director.

B. Each NO_x budget permit is deemed to incorporate automatically the definitions of terms under section (2) of this rule and, upon recordation by the administrator under subsections (3)(F), (G), or (H) of this rule, every allocation, transfer, or deduction of a NO_x allowance to or from the compliance accounts of the NO_x budget units covered by the permit or the overdraft account of the NO_x budget source covered by the permit.

5. Effective date of initial NO_x budget permit. The initial NO_x budget permit covering a NO_x budget unit for which a complete NO_x budget permit application is timely submitted under subparagraph (3)(C)2.B.of this rule shall become effective by the later of:

A. May 1, 2007;

B. May 1 of the year in which the NO_x budget unit commences operation, if the unit commences operation on or before May 1 of that year;

C. The date on which the NO_x budget unit commences operation, if the unit commences operation during a control period; or

D. May 1 of the year following the year in which the NO_x budget unit commences operation, if the unit commences operation on or after October 1 of the year.

6. NO_x budget permit revisions.

A. For a NO_x budget source with a Title V operating permit, except as provided in subparagraph (3)(C)4.B. of this rule, the director will revise the NO_x budget permit, as necessary, in accordance with the director's Title V operating permits regulations addressing permit revisions.

B. For a NO_x budget source with a non-Title V permit, except as provided in subparagraph (3)(C)4.B. of this rule, the director will revise the NO_x budget permit, as necessary, in accordance with the director's non-Title V permits regulations addressing permit revisions.

(D) Compliance Certification.

1. Compliance certification report.

A. For each control period in which one (1) or more NO_x budget units at a source are subject to the NO_x budget emissions limitation, the NO_x authorized account representative of the source shall submit to the director and the administrator by November 30 of that year, a compliance certification report for each source covering all such units.

B. The NO_x authorized account representative shall include in the compliance certification report under subparagraph (3)(D)1.A. of this rule the following elements, in a format prescribed by the administrator, concerning each unit at the source and subject to the NO_x budget emissions limitation for the control period covered by the report:

(I) Identification of each NO_x budget unit;

(II) At the NO_x authorized account representative's option, the serial numbers of the NO_x allowances that are to be deducted from each unit's compliance account under paragraph (3)(F)5. of this rule for the control period;

(III) At the NO_x authorized account representative's option, for units sharing a common stack and having emissions that are not monitored separately or apportioned in accordance with section (4) of this rule, the percentage of NO_x allowances that is to be deducted from each unit's compliance account under subparagraph (3)(F)5.E. of this rule; and

(IV) The compliance certification under subparagraph (3)(D)1.C. of this rule.

C. In the compliance certification report under subparagraph (3)(D)1.A. of this rule, the NO_x authorized account representative shall certify, based on reasonable inquiry of those persons with primary responsibility for operating the source and the NO_x budget units at the source in compliance with the NO_x budget trading program, whether each NO_x budget unit for which the compliance certification is submitted was operated during the calendar year covered by the report in compliance with the requirements of the NO_x budget trading program applicable to the unit, including:

(I) Whether the unit was operated in compliance with the NO_x budget emissions limitation;

(II) Whether the monitoring plan that governs the unit has been maintained to reflect the actual operation and monitoring of the unit, and contains all information necessary to attribute emissions to the unit, in accordance with section (4) of this rule;

(III) Whether all the emissions from the unit, or a group of units (including the unit) using a common stack, were monitored or accounted for through the missing data procedures and reported in the quarterly monitoring reports, including whether conditional data were reported in the quarterly reports in accordance with section (4) of this rule. If conditional data were reported, the owner or operator shall indicate whether the status of all conditional data has been resolved and all necessary quarterly report resubmissions have been made;

(IV) Whether the facts that form the basis for certification under section (4) of this rule of each monitor at the unit or a group of units (including the unit) using a common stack, or for using an excepted monitoring method or alternative monitoring method approved under section (4) of this rule, if any, has changed; and

(V) If a change is required to be reported under part (3)(D)1.C.(IV) of this rule, specify the nature of the change, the reason for the change, when the change occurred, and how the unit's compliance status was determined subsequent to the change, including what method was used to determine emissions when a change mandated the need for monitor recertification.

2. Director's and administrator's action on compliance certifications.

A. The director or the administrator may review and conduct independent audits concerning any compliance certification or any other submission under the NO_x budget trading program and make appropriate adjustments of the information in the compliance certifications or other submissions.

B. The administrator may deduct NO_x allowances from or transfer NO_x allowances to a unit's compliance account or a source's overdraft account based on the information in the compliance certifications or other submissions, as adjusted under subparagraph (3)(D)2.A. of this rule.

(E) NO_x Allowance Allocations.

1. The state trading program NO_x budget allocated by the director under paragraphs (3)(E)2. and (3)(E)3. of this rule for a control period will equal the total number of tons of emissions apportioned to the NO_x budget units in Missouri for the control period, as determined by the applicable, approved state implementation plan.

2. The following NO_x budget units shall be allocated NO_x allowances for each control period in accordance with Table I of paragraph (3)(E)2.

_Table I

NO_x Budget Unit	**Unit**	**Percentage of 1995 Heat Input**	**NO_x Allowances by Unit**
Associated Electric Cooperative—	1	8.49	1126

New Madrid			
Associated Electric Cooperative—New Madrid	2	8.91	1182
Ameren—Howard Bend	1	0.02	3
Ameren—Labadie	1	8.64	1146
Ameren—Labadie	2	9.52	1263
Ameren—Labadie	3	10.92	1449
Ameren—Labadie	4	10.09	1339
Ameren—Meramec	1	0.86	114
Ameren—Meramec	2	0.66	88
Ameren—Meramec	3	1.14	152
Ameren—Meramec	4	2.11	280
Ameren—Meramec	5	0.04	5
Ameren—Rush Island	1	10.59	1405
Ameren—Rush Island	2	10.52	1395
Ameren—Sioux	1	6.10	809
Ameren—Sioux	2	5.47	726
Ameren—Viaduct	1	0.03	4
City of Sikeston	1	5.88	780
Energy efficiency and renewable generation projects set-aside			134

3. The following existing non-EGU boilers shall be allocated NOx allowances for each control period in accordance with Table II of paragraph (3)(E)3.

Table II

Non-EGUs Boilers	**Unit**	**NO_x Limitation per Unit Tons Per Ozone Season**
Anheuser Busch	6	14
Trigen Ashley Street Station Boiler	5	9
Trigen Ashley Street Station Boiler	6	36

4. Any unit subject to subsection (1)(B) other than those listed in Tables I and II of this subsection will not be allocated NO_x budget allowances under this rule.

5. *Reserved*

6. Any person seeking set aside NO_x allowances for energy efficiency and renewable generation projects shall meet the requirements of paragraph (3)(E)6. of this rule.

A. The purpose for establishing these set-asides is to allocate NO_x allowances to serve as incentives for saving or generating electricity through the implementation of energy efficiency and renewable generation projects as defined in this section.

(I) Each energy efficiency and renewable generation set-aside shall contain the number of NO_x allowances as provided in Table I of this subsection.

(II) Awards of NO_x allowances will be available only to eligible energy efficiency or renewable generation projects that—

(a) Commence operation after September 1, 2005;

(b) Reduce electricity use, generate electricity from renewable resources or provide combined heat and power benefits during the period of May 1 through September 30, 2006, or subsequent control periods; and

(c) In an application submitted by November 30 of each year, include adequate documentation of these energy savings, renewable energy generation or combined heat and power benefits.

(III) Projects will be awarded NO_x allowances denominated for the control period following the control period during which the qualifying project activities took place. For example, sponsors of project activities that take place during the 2006 control period will receive NO_x allowances denominated for the 2007 control period.

(IV) Projects may qualify for awards from the set-aside for up to five (5) consecutive control periods.

(V) Department actions on applications for awards from the set-aside. The department shall act upon applications as follows:

(a) By March 1 preceding the control period for which NO_x allowances are requested, the department shall take the following actions:

I. For each application, the department shall determine whether the project is eligible and the application is complete and shall notify the applicant of its determination.

II. For the eligible and complete applications, the department shall calculate the total number of NO_x allowances which the projects are qualified to receive, not to exceed the total number of NO_x allowances allocated to the set-aside as provided in Table I of this subsection, and shall award said NO_x allowances to eligible energy efficiency or renewable generation projects.

(b) If the number of NO_x allowances awarded is fewer than NO_x allowances allocated to the set-aside as provided in Table I of this subsection, the department shall transfer surplus NO_x allowances to the accounts of the electric utilities listed in Table I of this subsection on a pro rata basis in the same proportion as allocations to NO_x budget units set forth in Table I of this subsection.

(c) If the number of NO_x allowances claimed for award is more than NO_x allowances allocated to the set-aside as provided in Table I of this subsection, the department shall determine awards based on each applicant's position in an eligible projects queue that will be established by the department.

B. Project eligibility. Allocations from the energy efficiency and renewable generation set-aside may be requested by any entity, including an electric utility listed in Table I of this subsection or its affiliate, that implements and demonstrates eligible projects as defined in this subparagraph.

(I) Eligibility requirements. The department shall establish requirements for project eligibility and shall determine which projects are eligible to receive awards from the set-aside.

(II) Only the following shall be eligible for awards from the set-aside:

(a) Energy efficiency projects resulting in reduced or more efficient electricity use through the voluntary modification of maintenance and operating procedures in a building or facility or the voluntary installation, replacement, or modification of equipment, fixtures, or materials in a building or facility.

I. Energy efficiency projects may be directed toward or located within buildings or facilities owned, leased, operated or controlled by an electric utility listed in Table I of this subsection or its affiliate. Eligibility requirements for these projects shall be the same as for any other energy efficiency project.

II. Energy efficiency projects may include demand side programs that result in reduced or more efficient electricity use;

(b) Renewable generation projects, including electric generation from wind, photovoltaic systems, biogas, geothermal and hydropower projects. Renewable generation projects do not include nuclear power projects. Eligible biogas projects include projects to generate electricity from methane gas captured from sanitary landfills, wastewater treatment plants, sewage treatment plants or agricultural livestock waste treatment systems. Eligible hydropower projects are restricted to systems—

I. That are certified by the Low Impact Hydropower Institute;

II. That employ a head of ten feet (10') or less; or

III. Employing a head greater than ten feet (10') that make use of a dam that existed prior to the effective date of this rule;

(c) Renewable biomass generation projects including projects in which one (1) or more biomass fuels is fired separately or co-fired with one (1) or more fossil fuels to generate electricity. Biomass includes wood and wood waste, energy crops such as switchgrass and agricultural wastes such as crop and animal waste. Electric generation from combustion of municipal solid waste is not included; and

(d) Combined heat and power projects that use integrated technologies, including cogeneration, which convert fuel to electric, thermal, and mechanical energy for on-site or local use. In the case of electricity generation combined heat and power can include export of power to the local electric utility transmission grid. The thermal energy from combined heat and power systems can be created and used in the form of steam, hot or chilled water for process, space heating or cooling, or other applications. To be eligible, the combined heat and power installation must meet or exceed technology-specific efficiency thresholds that will be established by the department.

(III) Additional eligibility requirements shall include the following:

(a) NO_x authorized account representative must be designated for the project on forms provided by the department;

(b) Only projects that are not required by federal government regulation and that are not and will not be used to generate compliance or permitting credits otherwise in the SIP are eligible to receive NO_x allowances from the set-aside;

(c) Only projects that equal at least one (1) ton of NO_x emissions, using conventional arithmetic rounding, are eligible to receive NO_x allowances from the set-aside. Multiple projects may be aggregated into a single NO_x allowance allocation request to equal one (1) or more tons of NO_x emissions;

(d) Only projects that commence operation after September 1, 2005 are eligible to receive NO_x allowances from the set-aside;

(e) Location of the project:

I. Renewable generation projects and renewable biomass generation projects, as defined in subpart (3)(E)6.B.(II)(C) of this rule located anywhere in the state of Missouri are eligible if the generation facility meets all other eligibility requirements and—

a. The facility is owned, leased, operated or controlled by an electric utility listed in Table I of this subsection or an affiliate and generates electricity that is primarily intended to be marketed or distributed to end users who are included in the utility's native load or who are located in the Missouri SIP region; or

b. The facility supplies power through a power purchase contract to an electric utility listed in Table I of this subsection or an affiliate and the power purchased is primarily intended to be marketed or distributed to end users who are included in the utility's native load or who are located in the Missouri SIP region.

II. Energy efficiency projects and combined heat and power projects, as defined in subpart (3)(E)6.B.(II)(d) of this rule, must be located in the area described in subsection (1)(A) of this rule to be eligible to receive NO_x allowances from the set-aside.

(IV) Pre-application eligibility review. Project sponsors may request a pre-application eligibility review preceding project activities that will serve as the basis for an application for awards from the set-aside. The review will cover eligibility requirements that can be determined prior to receipt of a complete application for awards. The request for early eligibility review must be submitted on forms provided by the department.

(V) Eligibility for any project may be claimed by only one (1) entity. The department shall determine procedures to be followed if multiple claims of eligibility for the same project are received.

C. Applications and calculations of awards. To qualify for an award of NO_x allowances from the set-aside an applicant must meet the following requirements:

(I) The project must be eligible as provided in paragraph (3)(E)6. of this rule;

(II) A complete application must be received by the last business day of November following the period of May 1 through September 30 during which the eligible project activities occurred. The application shall—

(a) Be prepared on forms provided by the department and must be submitted by the project's NO_x authorized account representative;

(b) Be submitted with certification by a professional engineer attesting that information and calculations submitted in the application are complete and accurate.

I. The department shall have the right to require verification of data and calculations that are presented in an application as a condition for awarding NO_x allowances to the applicant; and

II. Verification may include site visits by agents of the department;

(c) Demonstrate electricity savings or renewable generation and calculate the NO_x allowance award requested using methods that adhere to measurement and verification standards approved by the department; and

(d) If the applicant intends to reapply in subsequent years, the application must indicate the stream of benefits that is expected in subsequent years;

(III) The department shall determine methods for calculating awards of NO_x allowances based upon the following principles:

(a) NO_x allowances awarded to end-use electrical energy efficiency projects shall be calculated as the number of megawatt hours (MWh) of electricity saved during a control period multiplied by an emissions factor of 1.5 pounds of NO_x per MWh appropriately converted and rounded to tons using conventional arithmetic rounding. The department shall provide a factor to adjust the calculation of electricity saved to account for transmission and distribution line losses;

(b) NO_x allowances awarded to renewable generation projects from wind, photovoltaic systems, biogas, geothermal and hydropower projects shall be calculated as the number of kilowatt hours of electricity generated during a control period multiplied by an emissions factor of 1.5 pounds of NO_x per MWh appropriately converted and rounded to tons using conventional arithmetic rounding;

(c) NO_x allowances awarded to renewable biomass generation projects shall be calculated based on net NO_x emission reductions, appropriately converted and rounded to tons using conventional arithmetic rounding where—

I. Net NO_x emissions shall be calculated as the number of kilowatt hours of electricity generated during a control period multiplied by an emissions factor of 1.5 pounds of NO_x per MWh, minus the tons of NO_x emitted by the renewable generating project during the control period; and

II. When biomass is co-fired with other fuels, its share of electric generation and NO_x emissions shall be calculated based on its share of the total heat content of all fuels used in the co-firing process; and

(d) The department shall determine methods for calculating NO_x allowances for combined heat and power projects; and

(IV) A project's NO_x authorized account representative may reapply for set-aside awards for up to five (5) consecutive control periods by meeting the following requirements:

(a) Reapplication must be received by the last business day of November following the last day of the control period during which the energy efficiency and renewable electric generation activities took place;

(b) The reapplication must be prepared on forms provided by the department and must be submitted by the project's NO_x authorized account representative; and

(c) The application must be submitted with certification by a professional engineer attesting that information and calculations submitted in the application are complete and accurate.

(F) NO_x Allowance Tracking System.

1. NO_x allowance tracking system accounts.

A. Nature and function of compliance accounts and overdraft accounts. Consistent with subparagraph (3)(F)2.A. of this rule, the administrator will establish one (1) compliance account for each NO_x budget unit and one (1) overdraft account for each source with one (1) or more NO_x budget units. Allocations of NO_x allowances pursuant to subsection (3)(E) or paragraph (3)(H)9. of this rule and deductions or transfers of NO_x allowances pursuant to paragraphs (3)(D)2., (3)(F)5., (3)(F)7., subsection (3)(G), or subsection (3)(H) of this rule will be recorded in the compliance accounts or overdraft accounts in accordance with subsection (3)(F) of this rule.

B. Nature and function of general accounts. Consistent with subparagraph (3)(F)2.B. of this rule, the administrator will establish, upon request, a general account for any person. Transfers of NO_x allowances pursuant to subsection (3)(G) of this rule will be recorded in the general account in accordance with subsection (3)(F) of this rule.

2. Establishment of accounts.

A. Compliance accounts and overdraft accounts. Upon receipt of a complete account certificate of representation under paragraph (3)(B)4. of this rule, the administrator will establish—

(I) A compliance account for each NO_x budget unit for which the account certificate of representation was submitted; and

(II) An overdraft account for each source for which the account certificate of representation was submitted and that has two (2) or more NO_x budget units.

B. General accounts.

(I) Any person may apply to open a general account for the purpose of holding and transferring NO_x allowances. A complete application for a general account shall be submitted to the administrator and shall include the following elements in a format prescribed by the administrator:

(a) Name, mailing address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the NO_x authorized account representative and any alternate NO_x authorized account representative;

(b) At the option of the NO_x authorized account representative, organization name and type of organization;

(c) A list of all persons subject to a binding agreement for the NO_x authorized account representative or any alternate NO_x authorized account representative to represent their ownership interest with respect to the NO_x allowances held in the general account;

(d) The following certification statement by the NO_x authorized account representative and any alternate NO_x authorized account representative: "I certify that I was selected as the NO_x authorized account representative or the alternate NO_x authorized account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to NO_x allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under the NO_x budget trading program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the administrator or a court regarding the general account.";

(e) The signature of the NO_x authorized account representative and any alternate NO_x authorized account representative and the dates signed; and

(f) Unless otherwise required by the director or the administrator, documents of agreement referred to in the account certificate of representation shall not be submitted to the permitting authority or the administrator. Neither the director nor the administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

(II) Upon receipt by the administrator of a complete application for a general account under part (3)(F)2.B.(I) of this rule:

(a) The administrator will establish a general account for the person or persons for whom the application is submitted;

(b) The NO_x authorized account representative and any alternate NO_x authorized account representative for the general account shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to NO_x allowances held in the general account in all matters pertaining to the NO_x budget trading program, notwithstanding any agreement between the NO_x authorized account representative or any alternate NO_x authorized account representative and such person. Any such person shall be bound by any order or decision issued to the NO_x authorized account representative or any alternate NO_x authorized account representative by the administrator or a court regarding the general account;

(c) Each submission concerning the general account shall be submitted, signed, and certified by the NO_x authorized account representative or any alternate NO_x authorized account representative for the persons having an ownership interest with respect to NO_x allowances held in the general account. Each such submission shall include the following certification statement by the NO_x authorized account representative or any alternate NO_x authorized account representative: “I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the NO_x allowances held in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.”; and

(d) The administrator will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with subpart (3)(F)2.B.(II)(c) of this rule.

(III) NO_x authorized account representative for general accounts.

(a) An application for a general account may designate one (1) and only one (1) NO_x authorized account representative and one (1) and only one (1) alternate NO_x authorized account representative who may act on behalf of the NO_x authorized account representative. The agreement by which the alternate NO_x authorized account representative is selected shall include a procedure for authorizing the alternate NO_x authorized account representative to act in lieu of the NO_x authorized account representative.

(b) Upon receipt by the administrator of a complete application for a general account under part (3)(F)2.B.(I) of this rule, any representation, action, inaction, or submission by any alternate NO_x authorized account representative shall be deemed to be a representation, action, inaction, or submission by the NO_x authorized account representative.

(IV) Changes in account representatives for general accounts; changes in owners and operators.

(a) The NO_x authorized account representative for a general account may be changed at any time upon receipt by the administrator of a superseding complete application for a general account under part (3)(F)2.B.(I) of this rule. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous NO_x authorized account representative prior to the time and date when the administrator receives the superseding application for a general account shall be binding on the new NO_x authorized account representative and the persons with an ownership interest with respect to the NO_x allowances in the general account.

(b) The alternate NO_x authorized account representative for a general account may be changed at any time upon receipt by the administrator of a superseding complete application for a general account under part (3)(F)2.B.(I) of this rule. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate NO_x authorized account representative prior to the time and date when the administrator receives the superseding application for a general account shall be binding on the new alternate NO_x authorized account representative and the persons with an ownership interest with respect to the NO_x allowances in the general account.

(c) Changes in the owners and operators.

I. In the event a new person having an ownership interest with respect to NO_x allowances in the general account is not included in the list of such persons in the account certificate of representation, such new person shall be deemed to be subject to and bound by the account certificate of representation, the representation, actions, inactions, and submissions of the NO_x authorized account representative and any alternate NO_x authorized account representative of the source or unit, and the decisions, orders, actions, and inactions of the administrator, as if the new person were included in such list.

II. Within thirty (30) days following any change in the persons having an ownership interest with respect to NO_x allowances in the general account, including the addition of persons, the NO_x authorized account representative or any alternate NO_x authorized account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the NO_x allowances in the general account to include the change.

(V) Objections concerning the NO_x authorized account representative for a general account.

(a) Once a complete application for a general account under part (3)(F)2.B.(I) of this rule has been submitted and received, the administrator will rely on the application unless and until a superseding complete application for a general account under part (3)(F)2.B.(I) of this rule is received by the administrator.

(b) Except as provided in part (3)(F)2.B.(IV) of this rule, no objection or other communication submitted to the administrator concerning the authorization, or any representation, action, inaction, or submission of the NO_x authorized account representative or any alternate NO_x authorized account representative for a general account shall affect any representation, action, inaction, or submission of the NO_x authorized account representative or any alternate NO_x authorized account representative or the finality of any decision or order by the administrator under the NO_x budget trading program.

(c) The administrator will not adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the NO_x authorized account representative or any alternate NO_x authorized account representative for a general account, including private legal disputes concerning the proceeds of NO_x allowance transfers.

C. Account identification. The administrator will assign a unique identifying number to each account established under subparagraphs (3)(F)2.A. or B. of this rule.

3. Responsibilities of NO_x authorized account representative.

A. Following the establishment of a NO_x allowance tracking system account, all submissions to the administrator pertaining to the account, including, but not limited to, submissions concerning the deduction or transfer of NO_x allowances in the account, shall be made only by the NO_x authorized account representative for the account.

B. NO_x authorized account representative identification. The administrator will assign a unique identifying number to each NO_x authorized account representative.

4. Recordation of NO_x allowance allocations.

A. The administrator will record the NO_x allowances for 2007 and 2008 in the NO_x budget units' compliance accounts and the allocation set-asides, as allocated under subsection (3)(E) of this rule.

B. Each year, after the administrator has made all deductions from a NO_x budget unit's compliance account and the overdraft account pursuant to paragraph (3)(F)5. of this rule, the administrator will record NO_x allowances, as allocated to the unit under subsection (3)(E) of this rule or under part (3)(H)9.A.(II) of this rule, in the compliance account for the year after the last year for which NO_x allowances were previously allocated to the compliance account. Each year, the administrator will also record NO_x allowances, as allocated under subsection (3)(E) of this rule, in the allocation set-aside for the year after the last year for which NO_x allowances were previously allocated to an allocation set-aside.

C. Serial numbers for allocated NO_x allowances. When allocating NO_x allowances to and recording them in an account, the administrator will assign each NO_x allowance a unique identification number that will include digits identifying the year for which the NO_x allowance is allocated.

5. Compliance.

A. NO_x allowance transfer deadline. The NO_x allowances are available to be deducted for compliance with a unit's NO_x budget emissions limitation for a control period in a given year only if the NO_x allowances—

(I) Were allocated for a control period in a prior year or the same year; and

(II) Are held in the unit's compliance account, or the overdraft account of the source where the unit is located, as of the NO_x allowance transfer deadline for that control period or are transferred into the compliance account or overdraft account by a NO_x allowance transfer correctly submitted for recordation under paragraph (3)(G)1. of this rule by the NO_x allowance transfer deadline for that control period.

B. Deductions for compliance.

(I) Following the recordation, in accordance with paragraph (3)(G)2. of this rule, of NO_x allowance transfers submitted for recordation in the unit's compliance account or the overdraft account of the source where the unit is located by the NO_x allowance transfer deadline for a control period, the administrator will deduct NO_x allowances available under subparagraph (3)(F)5.A. of this rule to cover the unit's emissions (as determined in accordance with section (4) of this rule) for the control period—

(a) From the compliance account; and

(b) Only if no more NO_x allowances available under subparagraph (3)(F)5.A. of this rule remain in the compliance account, from the overdraft account. In deducting NO_x allowances for units at the source from the overdraft account, the administrator will begin with the unit having the compliance account with the lowest NO_x allowance tracking system account number and end with the unit having the compliance account with the highest NO_x allowance tracking system account number (with account numbers sorted beginning with the left-most character and ending with the right-most character and the letter characters assigned values in alphabetical order and less than all numeric characters).

(II) The administrator will deduct NO_x allowances first under subpart (3)(F)5.B.(I)(a) of this rule and then under subpart (3)(F)5.B.(I)(b) of this rule—

(a) Until the number of NO_x allowances deducted for the control period equals the number of tons of emissions, determined in accordance with section (4) of this rule, from the unit for the control period for which compliance is being determined; or

(b) Until no more NO_x allowances available under subparagraph (3)(F)5.A. of this rule remain in the respective account.

C. Identification of NO_x allowances.

(I) Identification of NO_x allowances by serial number. The NO_x authorized account representative for each compliance account may identify by serial number the NO_x allowances to be deducted from the unit's compliance account under subparagraph (3)(F)5.B., D., or E. of this rule. Such identification shall be made in the compliance certification report submitted in accordance with paragraph (3)(D)1. of this rule.

(II) First-in, first-out. The administrator will deduct NO_x allowances for a control period from the compliance account, in the absence of an identification or in the case of a partial identification of NO_x allowances by serial number under part (3)(F)5.C.(I) of this rule, or the overdraft account on a first-in, first-out (FIFO) accounting basis in the following order:

(a) Those NO_x allowances that were allocated for the control period to the unit under subsection (3)(E) or (H) of this rule;

(b) Those NO_x allowances that were allocated for the control period to any unit and transferred and recorded in the account pursuant to subsection (3)(G) of this rule, in order of their date of recordation; (c) Those NO_x allowances that were allocated for a prior control period to the unit under subsection (3)(E) or (H) of this rule; and

(d) Those NO_x allowances that were allocated for a prior control period to any unit and transferred and recorded in the account pursuant to subsection (3)(G) of this rule, in order of their date of recordation.

D. Deductions for excess emissions.

(I) After making the deductions for compliance under subparagraph (3)(F)5.B. of this rule, the administrator will deduct from the unit's compliance account or the overdraft account of the source where the unit is located a number of NO_x allowances, allocated for a control period after the control period in which the unit has excess emissions, equal to three (3) times the number of the unit's excess emissions.

(II) If the compliance account or overdraft account does not contain sufficient NO_x allowances, the administrator will deduct the required number of NO_x allowances, regardless of the control period for which they were allocated, whenever NO_x allowances are recorded in either account.

(III) Any NO_x allowance deduction required under subparagraph (3)(F)5.D. of this rule shall not affect the liability of the owners and operators of the NO_x budget unit for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violation, as ordered under the CAA or applicable state law. The following guidelines will be followed in assessing fines, penalties or other obligations:

(a) For purposes of determining the number of days of violation, if a NO_x budget unit has excess emissions for a control period, each day in the control period (one hundred fifty-three (153) days) constitutes a day in violation unless the owners and operators of the unit demonstrate that a lesser number of days should be considered; and

(b) Each ton of excess emissions is a separate violation.

E. Deductions for units sharing a common stack. In the case of units sharing a common stack and having emissions that are not separately monitored or apportioned in accordance with section (4) of this rule—

(I) The NO_x authorized account representative of the units may identify the percentage of NO_x allowances to be deducted from each such unit's compliance account to cover the unit's share of emissions from the common stack for a control period. Such identification shall be made in the compliance certification report submitted in accordance with paragraph (3)(D)1. of this rule; and

(II) Notwithstanding subpart (3)(F)5.B.(II)(a) of this rule, the administrator will deduct NO_x allowances for each such unit until the number of NO_x allowances deducted equals the unit's identified percentage (under part (3)(F)5.E.(I) of this rule) of the number of tons of emissions, as determined in accordance with section (4) of this rule, from the common stack for the control period for which compliance is being determined or, if no percentage is identified, an equal percentage for each such unit.

F. The administrator will record in the appropriate compliance account or overdraft account all deductions from such an account pursuant to subparagraph (3)(F)5.B., D., or E. of this rule.

6. Banking.

A. NO_x allowances may be banked for future use or transfer in a compliance account, an overdraft account, or a general account, as follows:

(I) Any NO_x allowance that is held in a compliance account, an overdraft account, or a general account will remain in such account unless and until the NO_x allowance is deducted or transferred under paragraphs (3)(D)2., (3)(F)5., (3)(F)7., subsection (3)(G), or subsection (3)(H) of this rule.

(II) The administrator will designate, as a "banked" NO_x allowance, any NO_x allowance that remains in a compliance account, an overdraft account, or a general account after the administrator has made all deductions for a given control period from the compliance account or overdraft account pursuant to paragraph (3)(F)5. of this rule and that was allocated for that control period or a control period in a prior year.

B. Each year starting in 2008, after the administrator has completed the designation of banked NO_x allowances under part (3)(F)6.A.(II) of this rule and before May 1 of the year, the administrator will determine the extent to which banked NO_x allowances may be used for compliance in the control period for the current year, as follows:

(I) The administrator will determine the total number of banked NO_x allowances held in compliance accounts, overdraft accounts, or general accounts.

(II) If the total number of banked NO_x allowances determined, under part (3)(F)6.B.(I) of this rule, to be held in compliance accounts, overdraft accounts, or general accounts is less than or equal to ten percent (10%) of the sum of the state trading program NO_x budgets for the control period for the states in which NO_x budget units are located, any banked NO_x allowance may be deducted for compliance in accordance with paragraph (3)(F)5. of this rule.

(III) If the total number of banked NO_x allowances determined, under part (3)(F)6.B.(I) of this rule, to be held in compliance accounts, overdraft accounts, or general accounts exceeds ten percent (10%) of the sum of the state trading program NO_x budgets for the control period for the states in which NO_x budget units are located, any banked NO_x allowance may be deducted for compliance in accordance with paragraph (3)(F)5. of this rule, except as follows:

(a) The administrator will determine the following ratio: 0.10 multiplied by the sum of the state trading program NO_x budgets for the control period for the states in which NO_x budget units are located and divided by the total number of banked NO_x allowances determined, under part (3)(F)6.B.(I) of this rule, to be held in compliance accounts, overdraft accounts, or general accounts.

(b) The administrator will multiply the number of banked NO_x allowances in each compliance account or overdraft account. The resulting product is the number of banked NO_x allowances in the account that may be deducted for compliance in accordance with paragraph (3)(F)5. of this rule. Any banked NO_x allowances in excess of the resulting product may be deducted for compliance in accordance with paragraph (3)(F)5. of this rule, except that, if such NO_x allowances are used to make a deduction, two (2) such NO_x allowances must be deducted for each deduction of one (1) NO_x allowance required under paragraph (3)(F)5. of this rule.

C. Any NO_x budget unit may reduce its NO_x emission rate in the 2002 through the 2006 control period, the owner or operator of the unit may request early reduction credits, and the permitting authority may allocate NO_x allowances in 2007 to the unit in accordance with the following requirements:

(I) Each NO_x budget unit for which the owner or operator requests any early reduction credits under part (3)(F)6.C.(IV) of this rule shall monitor emissions in accordance with section (4) of this rule starting prior to the first control period for which ERCs are requested and for each control period for which such early reduction credits are requested. The unit's monitoring system availability shall be not less than ninety percent (90%) during the applicable control period, and the unit must be in compliance with any applicable state or federal emissions or emissions-related requirements;

(II) NO_x emission rate and heat input under part (3)(F)6.C.(III) through (V) of this rule shall be determined in accordance with section (4) of this rule;

(III) Each NO_x budget unit for which the owner or operator requests any early reduction credits under part (3)(F)6.C.(IV) of this rule shall reduce its NO_x emission rate, for each control period for which early reduction credits are requested, to:

(a) Less than 0.25 lb/mmBtu in the years 2002 and 2003;

(b) Less than 0.25 lb/mmBtu in the years 2004 and 2005 for sources located in an area listed in subsection (1)(A) other than the City of St. Louis and the counties of Franklin, Jefferson, and St. Louis; or

(c) Less than 0.18 lb/mmBtu in the years 2004 through 2006 for sources located in the City of St. Louis and the counties of Franklin, Jefferson, and St. Louis.

(d) The calculation of early reduction credits in any year from 2002 through 2006 must be below any applicable limitation, which is more stringent than the requirements of subparts (a) through (c) of this part.

(IV) The NO_x authorized account representative of a NO_x budget unit that meets the requirements of part (3)(F)6.C.(I) and (III) of this rule may submit to the director a request for early reduction credits for the unit based on NO_x emission rate reductions made by the unit in the control period for 2002 or 2006 in accordance with part (3)(F)6.C.(III) of this rule.

(a) In the early reduction credit request, the NO_x authorized account representative may request early reduction credits for such control period in an amount equal to the unit's heat input for such control period multiplied by the difference between the applicable NO_x emission rate in part (3)(F)6.C.(III) of this rule and the unit's NO_x emission rate rounded to the nearest ton.

(b) The early reduction credit request must be submitted, in a format specified by the director, by October 31 of the year in which the NO_x emission rate reductions on which the request is based are made or such later date approved by the permitting authority;

(V) The director will allocate NO_x allowances, to NO_x budget units meeting the requirements of part (3)(F)6.C.(I) and (III) of this rule and covered by early reduction requests meeting the requirements of subpart (3)(F)6.C.(IV)(b) of this rule, in accordance with the following procedures:

(a) Upon receipt of each early reduction credit request, the director will accept the request only if the requirements of parts (3)(F)6.C.(I), (III), and subpart (3)(F)6.C.(IV)(b) of this rule are met and, if the request is accepted, will make any necessary adjustments to the request to ensure that the amount of the early reduction credits requested meets the requirement of parts (3)(F)6.C.(II) and (IV) of this rule;

(b) The director will allocate not more than five thousand six hundred thirty (5,630) ERCs over the period from 2002 through 2006, as follows:

I. The director will allocate not more than one half (1/2) of the total ERCs in the years 2002 and 2003;

II. The director will allocate not more than one half (1/2) of the total ERCs in the years 2004 and 2005; and

III. The director will allocate any remaining allowances during the year 2006;

(c) If the number of ERC allowances requested for a reduction achieved in a given control period from 2002 through 2006 is less than the number of ERCs to be distributed in accordance with the requirements of part (b) of this subparagraph, the director will allocate to each budget EGU one (1) allowance for each accepted ERC requested; and

(d) If the number of ERC allowances requested for a reduction achieved in a given control period from 2002 through 2006 is greater than the number of ERCs to be distributed in accordance with the requirements of part (b) of this subparagraph, the director will allocate to each budget EGU allowances for accepted requests on a pro rata basis;

(VI) The director will submit to the administrator the allocations of NO_x allowances determined under part (3)(F)6.C.(V) of this rule by the dates listed in subparts (a) and (b) of this part. The administrator will record such allocations to the extent that they are consistent with the requirements of parts (3)(F)6.C.(I) through (V) of this rule:

(a) For the years 2002 and 2003, the director will submit NO_x allowances on or before April 1, 2006;

(b) For the years 2004 through 2006, the director will submit NO_x allowances on or before April 1, 2007;

(VII) NO_x allowances recorded under part (3)(F)6.C.(VI) of this rule may be deducted for compliance under paragraph (3)(F)5. of this rule for the control periods in 2007 or 2008. Notwithstanding subparagraph (3)(F)6.A. of this rule, the administrator will deduct as retired any NO_x allowance that is recorded under part (3)(F)6.C.(VI) of this rule and is not deducted for compliance in accordance with paragraph (3)(F)5. of this rule for the control period in 2007 or 2008; and

(VIII) NO_x allowances recorded under part (3)(F)6.C.(VI) of this rule are not treated as banked NO_x allowances in 2007, and are treated as banked allowances in 2008, for the purposes of subparagraphs (3)(A)3., (3)(A)4. and (3)(A)5. of this rule.

7. Account error. The administrator may, at his or her sole discretion and on his or her own motion, correct any error in any NO_x allowance tracking system account. Within ten (10) business days of making such correction, the administrator will notify the NO_x authorized account representative for the account.

8. Closing of general accounts.

A. The NO_x authorized account representative of a general account may instruct the administrator to close the account by submitting a statement requesting deletion of the account from the NO_x allowance tracking system and by correctly submitting for recordation under paragraph (3)(G)1. of this rule a NO_x allowance transfer of all NO_x allowances in the account to one (1) or more other NO_x allowance tracking system accounts.

B. If a general account shows no activity for a period of a year or more and does not contain any NO_x allowances, the administrator may notify the NO_x authorized account representative for the account that the account will be closed and deleted from the NO_x allowance tracking system following twenty (20) business days after the notice is sent. The account will be closed after the twenty (20)-day period unless before the end of the twenty (20)-day period the administrator receives a correctly submitted transfer of NO_x allowances into the account under paragraph (3)(G)1. of this rule or a statement submitted by the NO_x authorized account representative demonstrating to the satisfaction of the administrator good cause as to why the account should not be closed.

(G) NO_x Allowance Transfers.

1. Submission of NO_x allowance transfers. The NO_x authorized account representatives seeking recordation of a NO_x allowance transfer shall submit the transfer to the administrator. To be considered correctly submitted, the NO_x allowance transfer shall include the following elements in a format specified by the administrator:

A. The numbers identifying both the transferor and transferee accounts;

B. A specification by serial number of each NO_x allowance to be transferred; and

C. The printed name and signature of the NO_x authorized account representative of the transferor account and the date signed.

2. EPA recordation.

A. Within five (5) business days of receiving a NO_x allowance transfer, except as provided in subparagraph (3)(G)2.B. of this rule, the administrator will record a NO_x allowance transfer by moving each NO_x allowance from the transferor account to the transferee account as specified by the request, provided that—

(I) The transfer is correctly submitted under paragraph (3)(G)1. of this rule;

(II) The transferor account includes each NO_x allowance identified by serial number in the transfer; and

(III) The transfer meets all other requirements of this rule.

B. A NO_x allowance transfer that is submitted for recordation following the NO_x allowance transfer deadline and that includes any NO_x allowances allocated for a control period prior to or the same as the control period to which the NO_x allowance transfer deadline applies will not be recorded until after completion of the process of recordation of NO_x allowance allocations in subparagraph (3)(F)4.B. of this rule.

C. Where a NO_x allowance transfer submitted for recordation fails to meet the requirements of subparagraph (3)(G)2.A. of this rule, the administrator will not record such transfer.

3. Notification.

A. Notification of recordation. Within five (5) business days of recordation of a NO_x allowance transfer under paragraph (3)(G)2. of this rule, the administrator will notify each party to the transfer. Notice will be given to the NO_x authorized account representatives of both the transferor and transferee accounts.

B. Notification of non-recordation. Within ten (10) business days of receipt of a NO_x allowance transfer that fails to meet the requirements of subparagraph (3)(G)2.A. of this rule, the administrator will notify the NO_x authorized account representatives of both accounts subject to the transfer of—

(I) A decision not to record the transfer; and

(II) The reasons for such non-recordation.

C. Nothing in this section shall preclude the submission of a NO_x allowance transfer for recordation following notification of non-recordation.

(H) *Reserved*

(4) Reporting and Record Keeping.

(A) General Requirements. The owners and operators, and to the extent applicable, the NO_x authorized account representative of a NO_x budget unit, shall comply with the monitoring and reporting requirements as provided in this rule and in subpart H of 40 CFR part 75. For purposes of complying with such requirements, the definitions in section (2) of this rule and in 40 CFR 72.2 shall apply, and the terms "affected unit," "designated representative," and "continuous emission monitoring system" (or "CEMS") in 40 CFR 75 shall be replaced by the terms "NO_x budget unit," "NO_x authorized account representative," and "continuous emission monitoring system" (or "CEMS"), respectively, as defined in section (2) of this rule.

1. Requirements for installation, certification, and data accounting. The owner or operator of each NO_x budget unit must meet the following requirements:

A. Install all monitoring systems required under section (4) for monitoring mass. This includes all systems required to monitor NO_x emission rate, concentration, heat input, and flow, in accordance with 40 CFR 75.72 and 75.76;

B. Install all monitoring systems for monitoring heat input, if required under subsection (4)(G) of this rule for developing NO_x allowance allocations;

C. Successfully complete all certification tests required under subsection (4)(B) of this rule and meet all other provisions of this rule and 40 CFR 75 applicable to the monitoring systems under subparagraphs (4)(A)1.A. and B. of this rule; and

D. Record, and report data from the monitoring systems under subparagraphs (4)(A)1.A. and B. of this rule.

2. Compliance dates. The owner or operator must meet the requirements of subparagraphs (4)(A)1.A. through C. of this rule on or before the following dates and must record and report data on and after the following dates:

A. NO_x budget units for which the owner or operator intends to apply for early reduction credits under subparagraph (3)(F)6.C. of this rule must comply with the requirements of section (4) of this rule by May 1, 2006;

B. Except for NO_x budget units under subparagraphs (4)(A)2.A. of this rule, NO_x budget units under section (1) of this rule that commence operation before January 1, 2006, must comply with the requirements of section (4) of this rule by May 1, 2006;

C. NO_x budget units under section (1) of this rule that commence operation on or after January 1, 2006 and that report on an annual basis under paragraph (4)(E)4. of this rule must comply with the requirements of section (4) of this rule by the later of the following dates:

(I) May 1, 2006; or

(II) The earlier of:

(a) One hundred eighty (180) days after the date on which the unit commences operation; or

(b) For units under paragraph (1)(B)1. of this rule, ninety (90) days after the date on which the unit commences commercial operation;

D. NO_x budget units under section (1) of this rule that commence operation on or after January 1, 2006 and that report on a control season basis under paragraph (4)(E)4. of this rule must comply with the requirements of section (4) of this rule by the later of the following dates:

(I) The earlier of:

(a) One hundred eighty (180) days after the date on which the unit commences operation; or

(b) For units under paragraph (1)(B)1. of this rule, ninety (90) days after the date on which the unit commences commercial operation;

(II) However, if the applicable deadline under part (4)(A)2.D.(I) of this rule does not occur during a control period, May 1, immediately following the date determined in accordance with part (4)(A)2.D.(I) of this rule;

E. For a NO_x budget unit with a new stack or flue for which construction is completed after the applicable deadline under subparagraphs (4)(A)2.A., B., or C. or subsection (3)(H) of this rule:

(I) Ninety (90) days after the date on which emissions first exit to the atmosphere through the new stack or flue;

(II) However, if the unit reports on a control season basis under paragraph (4)(E)4. of this rule and the applicable deadline under part (4)(A)2.E.(I) of this rule does not occur during the control period, May 1 immediately following the applicable deadline in part (4)(A)2.E.(I) of this rule.

3. Reporting data prior to initial certification.

A. The owner or operator of a NO_x budget unit that misses the certification deadline under subparagraph (4)(A)2.A. of this rule is not eligible to apply for early reduction credits. The owner or operator of the unit becomes subject to the certification deadline under subparagraph (4)(A)2.B. of this rule.

B. The owner or operator of a NO_x budget unit under subparagraph (4)(A)2.C. or D. of this rule must determine, record and report mass, heat input (if required for purposes of allocations) and any other values required to determine mass (e.g. NO_x emission rate and heat input or concentration and stack flow) using the provisions of 40 CFR 75.70(g), from the date and hour that the unit starts operating until all required certification tests are successfully completed.

4. Prohibitions.

A. No owner or operator of a NO_x budget unit or a non-NO_x budget unit monitored under 40 CFR 75.72(b)(2)(ii) shall use any alternative monitoring system, alternative reference method, or any other alternative for the required continuous emission monitoring system without having obtained prior written approval in accordance with subsection (4)(F) of this rule.

B. No owner or operator of a NO_x budget unit or a non-NO_x budget unit monitored under 40 CFR 75.72(b)(2)(ii) shall operate the unit so as to discharge, or allow to be discharged, emissions to the atmosphere without accounting for all such emissions in accordance with the applicable provisions of section (4) of this rule and 40 CFR 75 except as provided for in 40 CFR 75.74.

C. No owner or operator of a NO_x budget unit or a non-NO_x budget unit monitored under 40 CFR 75.72(b)(2)(ii) shall disrupt the continuous emission monitoring system, any portion thereof, or any other approved emission monitoring method, and thereby avoid monitoring and recording mass emissions discharged into the atmosphere, except for periods of recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of section (4) of this rule and 40 CFR 75 except as provided for in 40 CFR 75.74.

D. No owner or operator of a NO_x budget unit or a non-NO_x budget unit monitored under 40 CFR 75.72(b)(2)(ii) shall retire or permanently discontinue use of the continuous emission monitoring system, any component thereof, or any other approved emission monitoring system under section (4) of this rule, except under any one (1) of the following circumstances:

(I) During the period that the unit is covered by a retired unit exemption under subsection (1)(E) of this rule that is in effect;

(II) The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of section (4) and 40 CFR 75, by the director for use at that unit that provides emission data for the same pollutant or parameter as the retired or discontinued monitoring system; or

(III) The NO_x authorized account representative submits notification of the date of certification testing of a replacement monitoring system in accordance with subparagraph (4)(B)2.B. of this rule.

(B) Initial Certification and Recertification Procedures.

1. The owner or operator of a NO_x budget unit that is subject to an acid rain emissions limitation shall comply with the initial certification and recertification procedures of 40 CFR 75, except that:

A. If, prior to January 1, 2005, the administrator approved a petition under 40 CFR 75.17(a) or (b) for apportioning the NO_x emission rate measured in a common stack or a petition under 40 CFR 75.66 for an alternative to a requirement in 40 CFR 75.17, the NO_x authorized account representative shall resubmit the petition to the administrator under paragraph (4)(F)1. of this rule to determine if the approval applies under the NO_x budget trading program.

B. For any additional CEMS required under the common stack provisions in 40 CFR 75.72, or for any concentration CEMS used under the provisions of 40 CFR 75.71(a)(2), the owner or operator shall meet the requirements of paragraph (4)(B)2. of this rule.

2. The owner or operator of a NO_x budget unit that is not subject to an acid rain emissions limitation shall comply with the following initial certification and recertification procedures, except that the owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology under 40 CFR 75.19 shall also meet the requirements of paragraph (4)(B)3. of this rule and the owner or operator of a unit that qualifies to use an alternative monitoring system under subpart E of 40 CFR 75 shall also meet the requirements of paragraph (4)(B)4. of this rule. The owner or operator of a NO_x budget unit that is subject to an acid rain emissions limitation, but requires additional CEMS under the common stack provisions in 40 CFR 75.72, or that uses a concentration CEMS under 40 CFR 75.71(a)(2) also shall comply with the following initial certification and recertification procedures.

A. Requirements for initial certification. The owner or operator shall ensure that each monitoring system required by subpart H of 40 CFR 75 (which includes the automated data acquisition and handling system) successfully completes all of the initial certification testing required under 40 CFR 75.20. The owner or operator shall ensure that all applicable certification tests are successfully completed by the deadlines specified in paragraph (4)(A)2. of this rule. In addition, whenever the owner or operator installs a monitoring system in order to meet the requirements of this rule in a location where no such monitoring system was previously installed, initial certification according to 40 CFR 75.20 is required.

B. Requirements for recertification. Whenever the owner or operator makes a replacement, modification, or change in a certified monitoring system that the administrator or the director determines significantly affects the ability of the system to accurately measure or record mass emissions or heat input or to meet the requirements of 40 CFR 75.21 or Appendix B to 40 CFR 75, the owner or operator shall recertify the monitoring system according to 40 CFR 75.20(b). Furthermore, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that the administrator or the director determines to significantly change the flow or concentration profile, the owner or operator shall recertify the continuous emissions monitoring system according to 40 CFR 75.20(b). Examples of changes which require recertification include: replacement of the analyzer, change in location or orientation of the sampling probe or site, or changing of flow rate monitor polynomial coefficients.

C. Certification approval process for initial certifications and recertification.

(I) Notification of certification. The NO_x authorized account representative shall submit to the appropriate EPA regional office and the permitting authority a written notice of the dates of certification in accordance with subsection (4)(D) of this rule.

(II) Certification application. The NO_x authorized account representative shall submit to the director a certification application for each monitoring system required under subpart H of 40 CFR 75. A complete certification application shall include the information specified in subpart H of 40 CFR 75.

(III) Except for units using the low mass emission excepted methodology under 40 CFR 75.19, the provisional certification date for a monitor shall be determined using the procedures set forth in 40 CFR 75.20(a)(3). A provisionally certified monitor may be used under the NO_x budget trading program for a period not to exceed one hundred twenty (120) days after receipt by the director of the complete certification application for the monitoring system or component thereof under part (4)(B)2.C.(II) of this rule. Data measured and recorded by the provisionally certified monitoring system or component thereof, in accordance with the requirements of 40 CFR 75, will be considered valid quality-assured data (retroactive to the date and time of provisional certification), provided that the director does not invalidate the provisional certification by issuing a notice of disapproval within one hundred twenty (120) days of receipt of the complete certification application by the director.

(IV) Certification application formal approval process. The director will issue a written notice of approval or disapproval of the certification application to the owner or operator within one hundred twenty (120) days of receipt of the complete certification application under part (4)(B)2.C.(II) of this rule. In the event the permitting authority does not issue such a notice within such one hundred twenty (120)-day period, each monitoring system which meets the applicable performance requirements of 40 CFR 75 and is included in the certification application will be deemed certified for use under the NO_x budget trading program.
(a) Approval notice. If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of 40 CFR 75, then the director will issue a written notice of approval of the certification application within one hundred twenty (120) days of receipt.

(b) Incomplete application notice. A certification application will be considered complete when all of the applicable information required to be submitted under part (4)(B)2.C.(II) of this rule has been received by the director. If the certification application is not complete, then the director will issue a written notice of incompleteness that sets a reasonable date by which the NO_x authorized account representative must submit the additional information required to complete the certification application. If the NO_x authorized account representative does not comply with the notice of incompleteness by the specified date, then the director may issue a notice of disapproval under subpart (4)(B)2.C.(IV)(c) of this rule.

(c) Disapproval notice. If the certification application shows that any monitoring system or component thereof does not meet the performance requirements of this rule, or if the certification application is incomplete and the requirement for disapproval under subpart (4)(B)2.C.(IV)(b) of this rule has been met, the director will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the director and the data measured and recorded by each uncertified monitoring system or component thereof shall not be considered valid quality-assured data beginning with the date and hour of provisional certification. The owner or operator shall follow the procedures for loss of certification in part (4)(B)2.C.(V) of this rule for each monitoring system or component thereof which is disapproved for initial certification.

(d) Audit decertification. The director may issue a notice of disapproval of the certification status of a monitor in accordance with paragraph (4)(C)2. of this rule.

(V) Procedures for loss of certification. If the permitting authority issues a notice of disapproval of a certification application under subpart (4)(B)2.C.(IV)(c) of this rule or a notice of disapproval of certification status under subpart (4)(B)2.C.(IV)(d) of this rule, then—

(a) The owner or operator shall substitute the following values, for each hour of unit operation during the period of invalid data beginning with the date and hour of provisional certification and continuing until the time, date, and hour specified under 40 CFR 75.20(a)(5)(i):

I. For units using or intending to monitor for NO_x emission rate and heat input or for units using the low mass emission excepted methodology under 40 CFR 75.19, the maximum potential NO_x emission rate and the maximum potential hourly heat input of the unit; and

II. For units intending to monitor for mass emissions using a pollutant concentration monitor and a flow monitor, the maximum potential concentration of and the maximum potential flow rate of the unit under section 2.1 of Appendix A of 40 CFR 75;

(b) The NO_x authorized account representative shall submit a notification of certification retest dates and a new certification application in accordance with parts (4)(B)2.C.(I) and (II) of this rule; and

(c) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the director's notice of disapproval, no later than thirty (30) unit operating days after the date of issuance of the notice of disapproval.

3. Initial certification and recertification procedures for low mass emission units using the excepted methodologies under 40 CFR 75.19. The owner or operator of a gas-fired or oil-fired unit using the low mass emissions excepted methodology under 40 CFR 75.19 shall meet the applicable general operating requirements of 40 CFR 75.10, the applicable requirements of 40 CFR 75.19, and the applicable certification requirements of subsection (4)(B) of this rule, except that the excepted methodology shall be deemed provisionally certified for use under the NO_x budget trading program, as of the following dates:

A. For units that are reporting on an annual basis under paragraph (4)(E)4. of this rule—

(I) For a unit that commenced operation before its compliance deadline under paragraph (4)(B)2. of this rule, from January 1 of the year following submission of the certification application for approval to use the low mass emissions excepted methodology under 40 CFR 75.19 until the completion of the period for the director review; or

(II) For a unit that commenced operation after its compliance deadline under paragraph (4)(B)2. of this rule, the date of submission of the certification application for approval to use the low mass emissions excepted methodology under 40 CFR 75.19 until the completion of the period for director review; or

B. For units that are reporting on a control period basis under part (4)(E)2.C.(II) of this rule:

(I) For a unit that commenced operation before its compliance deadline under paragraph (4)(B)2. of this rule, where the certification application is submitted before May 1, from May 1 of the year of the submission of the certification application for approval to use the low mass emissions excepted methodology under 40 CFR 75.19 until the completion of the period for the director review;

(II) For a unit that commenced operation before its compliance deadline under paragraph (4)(B)2. of this rule, where the certification application is submitted after May 1, from May 1 of the year following submission of the certification application for approval to use the low mass emissions excepted methodology under 40 CFR 75.19 until the completion of the period for the director review; or

(III) For a unit that commences operation after its compliance deadline under paragraph (4)(B)2. of this rule, where the unit commences operation before May 1, from May 1 of the year that the unit commenced operation, until the completion of the period for the director's review; or

(IV) For a unit that has not operated after its compliance deadline under paragraph (4)(B)2. of this rule, where the certification application is submitted after May 1, but before October 1, from the date of submission of a certification application for approval to use the low mass emissions excepted methodology under 40 CFR 75.19 until the completion of the period for the director's review.

4. Certification/recertification procedures for alternative monitoring systems. The NO_x authorized account representative representing the owner or operator of each unit applying to monitor using an alternative monitoring system approved by the administrator and, if applicable, the director under subpart E of 40 CFR 75 shall apply for certification to the permitting authority prior to use of the system under the trading program. The NO_x authorized account representative shall apply for recertification following a replacement, modification or change according to the procedures in paragraph (4)(B)2. of this rule. The owner or operator of an alternative monitoring system shall comply with the notification and application requirements for certification according to the procedures specified in subparagraph (4)(B)2.C. of this rule and 40 CFR 75.20(f).

(C) Out of Control Periods.

1. Whenever any monitoring system fails to meet the quality assurance requirements of Appendix B of 40 CFR 75, data shall be substituted using the applicable procedures in subpart D, Appendix D, or Appendix E of 40 CFR 75.

2. Audit decertification. Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any system or compo-
nent should not have been certified or recertified because it did not meet a particular performance specification or other requirement under subsection (4)(B) of this rule or the applicable provisions of 40 CFR 75, both at the time of the initial certification or recertification application submission and at the time of the audit, the director will issue a notice of disapproval of the certification status of such system or component. For the purposes of this paragraph, an audit shall be either a field audit or an audit of any information submitted to the permitting authority or the administrator. By issuing the notice of disapproval, the director revokes prospectively the certification status of the system or component. The data measured and recorded by the system or component shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests. The owner or operator shall follow the initial certification or recertification procedures in subsection (4)(B) of this rule for each disapproved system.

(D) Notifications. The NO_x authorized account representative for a NO_x budget unit shall submit written notice to the permitting authority and the administrator in accordance with 40 CFR 75.61, except that if the unit is not subject to an acid rain emissions limitation, the notification is only required to be sent to the director.

(E) Record Keeping and Reporting.

1. General provisions.

A. The NO_x authorized account representative shall comply with all record keeping and reporting requirements in this section and with the requirements of subparagraph (3)(B)1.E. of this rule.

B. If the NO_x authorized account representative for a NO_x budget unit subject to an acid rain emission limitation who signed and certified any submission that is made under subpart F or G of 40 CFR 75 and which includes data and information required under section (4) of this rule or subpart H of 40 CFR 75 is not the same person as the designated representative or the alternative designated representative for the unit under 40 CFR 72, the submission must also be signed by the designated representative or the alternative designated representative.

2. Monitoring plans.

A. The owner or operator of a unit subject to an acid rain emissions limitation shall comply with requirements of 40 CFR 75.62, except that the monitoring plan shall also include all of the information required by subpart H of 40 CFR 75.

B. The owner or operator of a unit that is not subject to an acid rain emissions limitation shall comply with requirements of 40 CFR 75.62, except that the monitoring plan is only required to include the information required by subpart H of 40 CFR 75.

3. Certification applications. The NO_x authorized account representative shall submit an application to the permitting authority within forty-five (45) days after completing all initial certification or recertification tests required under subsection (4)(B) of this rule including the information required under subpart H of 40 CFR 75.

4. Quarterly reports. The NO_x authorized account representative shall submit quarterly reports, as follows:

A. If a unit is subject to an acid rain emission limitation or if the owner or operator of the NO_x budget unit chooses to meet the annual reporting requirements of section (4) of this rule, the NO_x authorized account representative shall submit a quarterly report for each calendar quarter beginning with:

(I) For units that elect to comply with the early reduction credit provisions under paragraph (3)(F)6. of this rule, the calendar quarter that includes the date of initial provisional certification under part (4)(B)2.C.(III) of this rule. Data shall be reported from the date and hour corresponding to the date and hour of provisional certification;

(II) For units commencing operation prior to May 1, 2006 that are not required to certify monitors by May 1, 2005 under subparagraph (4)(A)2.A. of this rule, the earlier of the calendar quarter that includes the date of initial provisional certification under part (4)(B)2.C.(III) of this rule or, if the certification tests are not completed by May 1, 2006, the partial calendar quarter from May 1, 2006 through June 30, 2006. Data shall be recorded and reported from the earlier of the date and hour corresponding to the date and hour of provisional certification or the first hour on May 1, 2006; or

(III) For a unit that commences operation after May 1, 2006, the calendar quarter in which the unit commences operation. Data shall be reported from the date and hour corresponding to when the unit commenced operation.

B. If a NO_x budget unit is not subject to an acid rain emission limitation, then the NO_x authorized account representative shall either:

(I) Meet all of the requirements of 40 CFR 75 related to monitoring and reporting mass emissions during the entire year and meet the reporting deadlines specified in subparagraph (4)(E)4.A. of this rule; or

(II) Submit quarterly reports only for the periods from the earlier of May 1 or the date and hour that the owner or operator successfully completes all of the recertification tests required under 40 CFR 75.74(d)(3) through September 30 of each year in accordance with the provisions of 40 CFR 75.74(b). The NO_x authorized account representative shall submit a quarterly report for each calendar quarter, beginning with:

(a) For units that elect to comply with the early reduction credit provisions under paragraph (3)(F)6. of this rule, the calendar quarter that includes the date of initial provisional certification under part (4)(B)2.C.(III) of this rule. Data shall be reported from the date and hour corresponding to the date and hour of provisional certification;

(b) For units commencing operation prior to May 1, 2006 that are not required to certify monitors by May 1, 2005 under subparagraph (4)(A)2.A. of this rule, the earlier of the calendar quarter that includes the date of initial provisional certification under part (4)(B)2.C.(III) of this rule, or if the certification tests are not completed by May 1, 2006, the partial calendar quarter from May 1, 2006 through June 30, 2006. Data shall be reported from the earlier of the date and hour corresponding to the date and hour of provisional certification or the first hour of May 1, 2006;

(c) For units that commence operation after May 1, 2006 during the control period, the calendar quarter in which the unit commences operation. Data shall be reported from the date and hour corresponding to when the unit commenced operation;

(d) For units that commence operation after May 1, 2006 and before May 1 of the year in which the unit commences operation, the earlier of the calendar quarter that includes the date of initial provisional certification under part (4)(B)2.C.(III) of this rule or, if the certification tests are not completed by May 1 of the year in which the unit commences operation, May 1 of the year in which the unit commences operation. Data shall be reported from the earlier of the date and hour corresponding to the date and hour of provisional certification or the first hour of May 1 of the year after the unit commences operation; or

(e) For units that commence operation after May 1, 2006 and after September 30 of the year in which the unit commences operation, the earlier of the calendar quarter that includes the date of initial provisional certification under part (4)(B)2.C.(III) of this rule or, if the certification tests are not completed by May 1 of the year after the unit commences operation, May 1 of the year after the unit commences operation. Data shall be reported from the earlier of the date and hour corresponding to the date and hour of provisional certification or the first hour of May 1 of the year after the unit commences operation.

C. The NO_x authorized account representative shall submit each quarterly report to the administrator within thirty (30) days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in subpart H of 40 CFR 75 and 40 CFR 75.64.

(I) For units subject to an acid rain emissions limitation, quarterly reports shall include all of the data and information required in subpart H of 40 CFR 75 for each NO_x budget unit (or group of units using a common stack) as well as information required in subpart G of 40 CFR 75.

(II) For units not subject to an acid rain emissions limitation, quarterly reports are only required to include all of the data and information required in subpart H of 40 CFR 75 for each NO_x budget unit (or group of units using a common stack).

D. Compliance certification. The NO_x authorized account representative shall submit to the administrator a compliance certification in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:

(I) The monitoring data submitted were recorded in accordance with the applicable requirements of this rule and 40 CFR 75, including the quality assurance procedures and specifications;

(II) For a unit with add-on emission controls and for all hours where data are substituted in accordance with 40 CFR 75.34(a)(1), the add-on emission controls were operating within the range of parameters listed in the monitoring plan and the substitute values do not systematically underestimate emissions; and

(III) For a unit that is reporting on a control period basis under paragraph (4)(E)4. of this rule, the NO_x emission rate and concentration values substituted for missing data under subpart D of 40 CFR 75 are calculated using only values from a control period and do not systematically underestimate emissions.

(F) Petitions.

1. The NO_x authorized account representative of a NO_x budget unit that is subject to an acid rain emissions limitation may submit a petition under 40 CFR 75.66 to the administrator requesting approval to apply an alternative to any requirement of section (4) of this rule.

A. Application of an alternative to any requirement of section (4) of this rule is in accordance with section (4) of this rule only to the extent that the petition is approved by the administrator, in consultation with the permitting authority.

B. Notwithstanding subparagraph (4)(F)1.A. of this rule, if the petition requests approval to apply an alternative to a requirement concerning any additional CEMS required under the common stack provisions of 40 CFR 75.72, the petition is governed by paragraph (4)(F)2. of this rule.

2. The NO_x authorized account representative of a NO_x budget unit that is not subject to an acid rain emissions limitation may submit a petition under 40 CFR 75.66 to the director and the administrator requesting approval to apply an alternative to any requirement of section (4) of this rule.

A. The NO_x authorized account representative of a NO_x budget unit that is subject to an acid rain emissions limitation may submit a petition under 40 CFR 75.66 to the director and the administrator requesting approval to apply an alternative to a requirement concerning any additional CEMS required under the common stack provisions of 40 CFR 75.72 or a concentration CEMS used under 40 CFR 75.71(a)(2).

B. Application of an alternative to any requirement of section (4) of this rule is in accordance with section (4) of this rule only to the extent the petition under paragraph (4)(F)2. of this rule is approved by both the permitting authority and the administrator.

(G) Additional Requirements to Provide Heat Input Data for Allocations Purposes.

1. The owner or operator of a unit that elects to monitor and report mass emissions using a concentration system and a flow system shall also monitor and report heat input at the unit level using the procedures set forth in 40 CFR 75 for any source located in a state developing source allocations based upon heat input.

2. The owner or operator of a unit that monitors and reports mass emissions using a concentration system and a flow system shall also monitor and report heat input at the unit level using the procedures set forth in 40 CFR 75 for any source that is applying for early reduction credits under paragraph (3)(F)6. of this rule.

(H) Record Keeping and Reporting Maintenance.

1. Unless otherwise provided, the owners and operators of the NO_x budget source and each NO_x budget unit at the source shall keep on-site at the source each of the following documents for a period of five (5) years from the date the document is created. This period may be extended for cause, at any time prior to the end of five (5) years, in writing by the director or the administrator.

A. The account certificate of representation for the NO_x authorized account representative for the source and each NO_x budget unit at the source and all documents that demonstrate the truth of the statements in the account certificate of representation, in accordance with paragraph (3)(B)4.; provided that the certificate and documents shall be retained on-site at the source beyond such five (5)-year period until such documents are superseded because of the submission of a new account certificate of representation changing the NO_x authorized account representative.

B. All emissions monitoring information, in accordance with section (4) of this rule; provided that to the extent that section (4) of this rule provides for a three (3)-year period for record keeping, the three (3)-year period shall apply.

C. Copies of all reports, compliance certifications, and other submissions and all records made or required under the NO_x budget trading program.

D. Copies of all documents used to complete a NO_x budget permit application and any other submission under the NO_x budget trading program or to demonstrate compliance with the requirements of the NO_x budget trading program.

2. The NO_x authorized account representative of a NO_x budget source and each NO_x budget unit at the source shall submit the reports and compliance certifications required under the NO_x budget trading program, including those under subsections (3)(D), (3)(H), or section (4) of this rule.

(5) Test Methods. (Not Applicable)

AUTHORITY: section 643.050, RSMo 2000. Original rule filed Feb. 14, 2005, effective Oct. 30, 2005. Amended: Filed Oct. 2, 2006, effective May 30, 2007.*

**Original authority: 643.050, RSMo 1965, amended 1972, 1992, 1993, 1995.*

10 CSR 10-6.380 Control of NO_x Emissions From Portland Cement Kilns

PURPOSE: This rule reduces emissions of oxides of nitrogen (NO_x) to ensure compliance with the federal NO_x control plan to reduce the transport of air pollutants. The rule establishes NO_x control equipment and NO_x emission levels for cement kilns. The evidence supporting the need for this proposed rulemaking per section 536.016, RSMo, is the U.S. Environmental Protection Agency NO_x *State Implementation Plan (SIP) Call dated April 21, 2004.*

(1) Applicability. This rule applies to any cement kiln located in the counties of Bollinger, Butler, Cape Girardeau, Carter, Clark, Crawford, Dent, Dunklin, Franklin, Gasconade, Iron, Jefferson, Lewis, Lincoln, Madison, Marion, Mississippi, Montgomery, New Madrid, Oregon, Pemiscot, Perry, Pike, Ralls, Reynolds, Ripley, St. Charles, St. Francois, St. Louis, Ste. Genevieve, Scott, Shannon, Stoddard, Warren, Washington and Wayne counties and the City of St. Louis that—

(A) Is a long dry kiln with an actual process rate of at least twelve tons of clinker produced per hour (12 TPH);

(B) Is a long wet kiln with an actual process rate of at least ten (10) TPH;

(C) Is a preheater kiln with an actual process rate of at least sixteen (16) TPH; or

(D) Is a precalciner or preheater/precalciner kiln with an actual process rate of at least twenty-two (22) TPH.

(2) Definitions.

(A) Clinker—The product of a Portland cement kiln from which finished cement is manufactured by milling and grinding.

(B) Long-dry kiln—A kiln fourteen feet (14') or larger in diameter, four hundred feet (400') or greater in length, which employs no preheating of the feed and the inlet feed to the kiln is dry.

(C) Long-wet kiln—A kiln fourteen feet (14') or larger in diameter, four hundred feet (400') or greater in length, which employs no preheating of the feed and the inlet feed to the kiln is a slurry.

(D) Low-NO_x burners—A type of cement kiln burner (a device that functions as an injector of fuel and combustion air into kiln to produce a flame that burns as close as possible to the center line of the kiln) that has a series of channels or orifices that 1) allow for the adjustment of the volume, velocity, pressure, and/or direction of the air carrying the fuel, known as primary air, into the kiln, and 2) impart high momentum and turbulence to the fuel stream to facilitate mixing of the fuel and secondary air.

(E) Mid-kiln firing—Secondary firing in kiln systems by injecting fuel at an intermediate point in the kiln system using a specially designed fuel injection mechanism for the purpose of decreasing NO_x emissions through—

1. The burning of part of the fuel at a lower temperature; and
2. The creation of reducing conditions at the point of initial combustion.

(F) Portland cement—A hydraulic cement produced by pulverizing clinker consisting essentially of hydraulic calcium silicates, usually containing one (1) or more of the forms of calcium sulfate as an interground addition.

(G) Portland cement kiln—A system, including any solid, gaseous or liquid fuel combustion equipment, used to calcine and fuse raw materials, including limestone and clay, to produce Portland cement clinker.

(H) Preheater/precalciner kiln—A kiln where the feed to the kiln system is preheated in cyclone chambers and that utilizes a second burner to provide heat for calcination of material prior to the material entering the rotary kiln which forms clinker.

(I) Preheater kiln—A kiln where the feed to the kiln system is preheated in cyclone chambers prior to the final fusion, which forms clinker.

(J) Recoverable fuel—Fuels that have been permitted for use for energy recovery under 10 CSR 10-6.065.

(K) Renewable fuel—Renewable energy resources that include but are not limited to solar (photovoltaic), wind, and biomass. Biomass includes but is not limited to: agricultural crops and crop waste, untreated wood and wood wastes, livestock waste, wastepaper, and organic municipal solid waste.

(L) Definitions of certain terms specified in this rule, other than those defined in this rule section, may be found in 10 CSR 10-6.020.

(3) General Provisions.

(A) Beginning May 1, 2007 an owner or operator of any Portland cement kiln subject to this rule shall not operate the kiln during the period starting May 1 and ending September 30 of each year, unless the kiln installs and operates with one (1) of the following:

1. Low-NO_x burners;
2. Mid-kiln firing;
3. An alternative control technology that is approved by the staff director, and incorporated in the federally approved SIP, and is proven to achieve emission reductions of thirty percent (30%) or greater;
4. An emission rate of:

A. For long-wet kilns—6.8 pounds of NO_x per ton of clinker produced, averaged over the period from May 1 through September 30 of each year.

B For long-dry kilns—6.0 pounds of NO_x per ton of clinker produced, averaged over the period from May 1 through September 30 of each year.

C. For preheater kilns—4.1 pounds of NO_x per ton of clinker produced, averaged over the period from May 1 through September 30 of each year.

D. For preheater/precalciner kilns—2.7 pounds of NO_x per ton of clinker produced, averaged over the period from May 1 through September 30 of each year; or

5. The findings of a case-by-case study committed to and conducted by the owner or operator and approved by the staff director, and incorporated into the federally approved SIP, taking into account energy, environmental, and economic impacts and other costs to determine an emission limitation that is achievable for the installation through application of production processes or available methods, systems and techniques, including fuel cleaning or treatment or innovative fuel combustion techniques for control of NO_x.

(B) To meet the requirements of paragraph (3)(A)3. or (3)(A)5. of this rule, the owner or operator may take into account as a portion of the required NO_x reductions, physical and quantifiable measures to increase energy efficiency, reduce energy demand, or increase use of renewable or recoverable fuels.

(C) Excess Emissions During Start-Up, Shutdown, or Malfunction. If the owner or operator provides notice of excess emissions pursuant to state rule 10 CSR 10-6.050(3)(B), the director will determine whether the excess emissions are attributable to start-up, shutdown or malfunction conditions, pursuant to rule 10 CSR 10-6.050(3)(C). If the director determines that the excess emissions are attributable to such conditions, and if such excess emissions cause a kiln to exceed the applicable emission limits in this rule, the director will determine whether enforcement action is warranted, as provided in rule 10 CSR 10-6.050(3)(C). If the director determines that the excess emissions are attributable to a start-up, shutdown, or malfunction condition and does not warrant enforcement action, those emissions would not be included in the calculation of ozone season NO_x emissions.

(4) Reporting and Record Keeping.

(A) Reporting Requirements. The owner or operator of a kiln subject to this rule shall comply with the following requirements:

1. By May 1, 2007, the owner or operator shall submit to the staff director the identification number and type of each unit subject to this rule, the name and address of the plant where the unit is located, and the name and telephone number of the person responsible for demonstrating compliance with this rule;

2. The owner or operator shall submit to the staff director by October 31 of each year, beginning in the year 2007, an annual report documenting for that unit:

A. The emissions, in pounds of NO_x per ton of clinker produced from each affected Portland cement kiln during the period from May 1 through September 30;

B. The results of any performance testing; and

C. Cement kiln clinker production, in tons, from May 1 through September 30; and

3. If the owner or operator elects to comply with paragraph (3)(A)3. or (3)(A)5. of this rule, the owner or operator will supply, starting April 2008, the staff director with a report as specified in the compliance plan.

(B) Record Keeping Requirements.

1. Any owner or operator of a unit subject to this rule shall produce and maintain records, which shall include, but are not limited to the results of any initial performance test, the results of any subsequent performance tests, the date, time and duration of any start-up, shutdown or malfunction in the operation of any of the cement kilns or the emissions monitoring equipment, as applicable.

2. If an owner or operator elects to use subsection (3)(B) of this rule as part of the compliance plan, the owner or operator must retain records as agreed to in the approved compliance plan.

3. Daily cement kiln clinker production in tons per day.

4. Any applicable monitoring data.

5. All records required to be produced or maintained shall be retained on-site for a minimum of five (5) years and made available upon request.

(C) Monitoring Requirements.

1. An owner or operator complying with paragraph (3)(A)1. or (3)(A)2. of this rule shall maintain and operate the device according to the manufacturer's specifications as approved by the permitting agency. The monitoring shall:

A. Include parameters indicated in the manufacturer's specifications and recommendations for the low-NO_x burner or mid-kiln firing system as approved by the permitting agency; and

B. Identify the specific operation conditions to be monitored and correlation between the operating conditions and NO_x emission rate.

2. An owner or operator complying with paragraph (3)(A)3., (3)(A)4., or (3)(A)5. of this rule shall complete an initial performance test by May 1, 2007 and subsequent performance tests, on an annual basis, consistent with the requirements of section (5) of this rule.

3. An owner or operator may comply with the requirements in paragraph (4)(C)1. through the use of an alternative compliance method approved by the staff director and incorporated in the federally approved SIP.

4. Any deviation from the operating conditions or specifications, which result in an increase in NO_x emissions, established in this paragraph constitute a violation of this rule, unless the owner or operator demonstrates to the satisfaction of the director that the deviation did not result in an increase in NO_x emissions.

(5) Test Methods. NO_x emission level testing shall use one (1) of the following methods as specified by 40 CFR part 60 Appendix A—Reference Methods:

(A) Method 7—Determination of Nitrogen Oxide Emissions from Stationary Sources;

(B) Method 7A—Determination of Nitrogen Oxide Emissions from Stationary Sources—Ion Chromatographic Method;

(C) Method 7C—Determination of Nitrogen Oxide Emissions from Stationary Sources—Alkaline-Permanganate/Colorimetric Method;

(D) Method 7D—Determination of Nitrogen Oxide Emissions from Stationary Sources—Alkaline-Permanganate/Ion Chromatographic Method; or

(E) Method 7E—Determination of Nitrogen Oxide Emissions from Stationary Sources (Instrumental Analyzer Procedure).

AUTHORITY: section 643.050, RSMo 2000. Original rule filed Feb. 14, 2005, effective Oct. 30, 2005.*

**Original authority: 643.050, RSMo 1965, amended 1972, 1992, 1993, 1995.*

10 CSR 10-6.390 Control of NO_x Emissions From Large Stationary Internal Combustion Engines

PURPOSE: This rule reduces emissions of oxides of nitrogen (NO_x) to ensure compliance with the federal NO_x control plan to reduce the transport of air pollutants. This rule establishes emission levels for large stationary internal combustion engines. The evidence supporting the need for this proposed rulemaking, per section 536.016, RSMo, is the U.S. Environmental Protection Agency NO_x State Implementation Plan (SIP) Call dated April 21, 2004.

(1) Applicability. This rule applies to any large stationary internal combustion engine located in the counties of Bollinger, Butler, Cape Girardeau, Carter, Clark, Crawford, Dent, Dunklin, Franklin, Gasconade, Iron, Jefferson, Lewis, Lincoln, Madison, Marion, Mississippi, Montgomery, New Madrid, Oregon, Pemiscot, Perry, Pike, Ralls, Reynolds, Ripley, St. Charles, St. Francois, St. Louis, Ste. Genevieve, Scott, Shannon, Stoddard, Warren, Washington, and Wayne counties and the City of St. Louis greater than one thousand three hundred (1,300) horsepower that—

(A) Emitted greater than one (1) ton per day of NO_x on average during the period from May 1 through September 30 of 1995, 1996, or 1997; or

(B) Begins operation after September 30, 1997.

(C) Any stationary internal combustion engine that meets the definition of emergency standby engine in subsection (2)(C) of this rule is exempt from this rule.

(2) Definitions.

(A) Diesel engine—A compression ignited (CI) two- or four-stroke engine in which liquid fuel is injected into the combustion chamber and ignited when the air charge has been compressed to a temperature sufficiently high for auto-ignition.

(B) Dual fuel engine—Compression ignited stationary internal combustion engine that is capable of burning liquid fuel and gaseous fuel simultaneously.

(C) Emergency standby engine—An internal combustion engine used only when normal electrical power or natural gas service is interrupted, or for the emergency pumping of water for either fire protection or flood relief. An emergency standby engine may not be operated to supplement a primary power source when the load capacity or rating of the primary power source has been either reached or exceeded.

(D) Engine rating—The output of an engine as determined by the engine manufacturer and listed on the nameplate of the unit, regardless of any derating.

(E) Higher heating value (HHV)—The total heat liberated per mass of fuel burned in British thermal units (Btu) per pound, when fuel and dry air at standard conditions undergo complete combustion and all resultant products are brought to their standard states at standard conditions. If certification of the HHV is not provided by the third party fuel supplier, it shall be determined by one of the following test methods: ASTM D2015-85 for solid fuels; ASTM D240-87 or ASTM D2382-88 for liquid hydrocarbon fuels; or ASTM D1826-88 or ASTM D1945-81 in conjunction with ASTM D3588-89 for gaseous fuels. These methods are all incorporated by reference as specified at 40 CFR 52.3002.

(F) Lean-burn engine—Any two- or four-stroke spark ignited (SI) engine with greater than four percent (4%) oxygen in the engine exhaust.

(G) Maintenance operation—Normal routine maintenance on any stationary internal combustion engine subject to this rule or the use of an emergency standby engine and fuel system during testing, repair and routine maintenance to verify its readiness for emergency standby use.

(H) Output—The shaft work output from any engine plus the energy reclaimed by any useful heat recovery system.

(I) Peak load—The maximum instantaneous operating load.

(J) Permitted capacity factor—The annual permitted fuel use divided by the manufacturers specified maximum fuel consumption times eight thousand seven hundred sixty (8,760) hours per year.

(K) Rich-burn engine—A two- or four-stroke SI engine where the oxygen content in the exhaust stream before any dilution is one percent (1%) or less measured on a dry basis.

(L) Stationary internal combustion engine—Internal combustion engine of the reciprocating type that is either attached to a foundation at a facility or is designed to be capable of being carried or moved from one (1) location to another and remains at a single site at a building, structure, facility, or installation for more than twelve (12) consecutive months. Any engine or engines that replace an engine at a site that is intended to perform the same or similar function as the engine replaced is included in calculating the consecutive time period. Nonroad engines and engines used solely for competition are not stationary internal combustion engines.

(M) Stoichiometric air/fuel ratio—The air/fuel ratio where all fuel and all oxygen in the air/fuel mixture will be consumed.

(N) Unit—Any diesel, lean-burn, or rich-burn stationary internal combustion engine as defined in this section.

(O) Utilization rate—The amount of an engine's capacity reported in horsepower-hours that is utilized.

(P) Definitions of certain terms used in this rule, other than those specified in this rule, may be found in 10 CSR 10-6.020.

(3) General Provisions.

(A) An owner or operator of a large stationary internal combustion engine meeting the applicability of paragraph (1)(A)1. of this rule shall calculate the allowable NO_x emission rate for each applicable engine using:

$$ER = (NO_{x\ act}/UR) \times 1.102 \times 10^{-6} \times 0.1$$

where,

ER = the allowable emission rate for each engine in grams per horsepower-hour;

$NO_{x\ act}$ = the highest actual NO_x emissions, reported in tons per control period, for the period from May 1 through September 30 for one of the years 1995, 1996, or 1997 based on the best available emission information for each engine; and

UR = the utilization rate in horse-power-hours during the same period as $NO_{x\ act}$

(B) An owner or operator of a large stationary internal combustion engine meeting the applicability of paragraph (1)(A)2. of this rule shall not operate an engine to exceed the permitted emission rate or the following emission rate, whichever is more stringent:

1. For rich-burn SI engines 3.0 grams per horsepower-hour; or
2. For lean-burn SI engines 3.0 grams per horsepower-hour;

(C) An owner or operator of a large stationary internal combustion engine may choose to establish a facility-wide NO_x emissions cap in lieu of compliance with subsection (3)(A) of this rule. If the owner or operator elects to comply with the requirements of subsection (3)(A), the owner or operator shall submit a commitment in writing no later than May 1, 2005, to the director stating the intent to comply with that subsection. If the owner or operator commits to comply with this subsection rather than subsection (3)(A) of this rule, the owner or operator shall submit the following to the director:

1. The facility-wide NO_x emissions from the year of data that would be used in paragraph (3)(A)1. of this rule on a unit-by-unit basis;
2. The number of tons of NO_x emission reductions that would be required in paragraph (3)(A)1. of this rule on a unit-by-unit basis;
3. A detailed inventory of all engines being used to comply with the NO_x emission cap including the:
   A. Uncontrolled emission rate of all engines at the facility;
   B. Controlled emission rate for all engines being controlled under the NO_x emissions cap;
   C. Capacity of each engine at the facility; and
   D. Utilization rate of each engine at the facility; and
4. The controlled NO_x emissions from the facility during the control period, May 1 through September 30.

(D) To meet the requirements of subsection (3)(A) or (3)(B) of this rule, the owner or operator may take into account as a portion of the required NO_x reductions, physical and quantifiable measures to increase energy efficiency, reduce energy demand, or increase use of renewable fuels.

(E) Monitoring Requirements.

1. Any owner or operator meeting the applicability of section (1) of this rule shall not operate such equipment unless it is equipped with one of the following:
   A. A continuous emissions monitoring system (CEMS), which meets the applicable requirements of 40 CFR part 60, subpart A, Appendix B, and complies with the quality assurance procedures specified in 40 CFR part 60, Appendix F. The CEMS shall be used to demonstrate compliance with the applicable emission limit; or
   B. A calculational and record keeping procedure based upon actual NO_x emissions testing and correlations with operating parameters. The installation, implementation and use of such an alternate calculational and record keeping procedure must be approved by the director and EPA and incorporated into the SIP in writing prior to implementation.
2. The CEMS or approved alternate monitoring procedure shall be operated and maintained in accordance with an on-site CEMS or alternate monitoring plan approved by the director.

(F) Excess Emissions During Start-Up, Shutdown, or Malfunction. If the owner or operator provides notice of excess emissions pursuant to state rule 10 CSR 10-6.050(3)(B), the director will determine whether the excess emissions are attributable to start-up, shutdown or malfunction conditions, pursuant to rule 10 CSR 10-6.050(3)(C). If the director determines that the excess emissions are attributable to such conditions, and if such excess emissions cause a kiln to exceed the applicable emission limits in this rule, the director will determine whether enforcement action is warranted, as provided in rule 10 CSR 10-6.050(3)(C). If the director determines that the excess emissions are attributable to a start-up, shutdown, or malfunction condition and does not warrant enforcement action, those emissions would not be included in the calculation of ozone season NO_x emissions.

(4) Reporting and Record Keeping.

(A) Reporting Requirements. The owner or operator subject to this rule shall comply with the following requirements:

1. The owner or operator shall submit to the director the identification number and type of each unit subject to this rule, the name and address of the plant where the unit is located, and the name and telephone number of the person responsible for demonstrating compliance with this rule before May 1, 2007;

2. The owner or operator shall submit an annual report documenting for each controlled unit the total NO_x emissions from May 1 through September 30 of each year to the director by November 1 of that year, beginning in 2007; and

3. The owner or operator of a unit subject to this rule and operating a CEMS shall submit an excess emissions monitoring systems performance report, in accordance with the requirements of 40 CFR 60.7(c) and 60.13.

(B) Record Keeping Requirements. Any owner or operator of a unit subject to this rule shall maintain all records necessary to demonstrate compliance with this rule for a period of five (5) years at the plant at which the subject unit is located. The records shall be made available to the director upon request. The owner or operator shall maintain records of the following information for each day of the control period the unit is operated:

1. The identification number of each unit and the name and address of the plant where the unit is located for each unit subject to the requirements of this rule;

2. The calendar date of record;

3. The number of hours the unit is operated during each day including start-ups, shutdowns, malfunctions, and the type and duration of maintenance and repair;

4. The date and results of each emissions inspection;

5. A summary of any emissions corrective maintenance taken;

6. The results of all compliance tests; and

7. If a unit is equipped with a CEMS—

A. The identification of time periods during which NO_x standards are exceeded, the reason for the exceedance, and action taken to correct the exceedance and to prevent similar future exceedances; and

B. The identification of the time periods for which operating conditions and pollutant data were not obtained including reasons for not obtaining sufficient data and a description of corrective actions taken.

(5) Test Methods. *(Not Applicable)*

Alpine Geophysics Final Report...

VIA E-MAIL

9 May 2006

Mr. Jeff Peltola
CENRAP Technical Director
10005 S. Pennsylvania, Ste C
Oklahoma City, OK 73159

Dear Jeff:

The scientists at Alpine Geophysics are pleased to submit the attached document titled "Final CENRAP Regional Haze Control Strategy Analysis Plan" as outlined in Task 6 of our previously submitted quotation and work plan.

This document and associated materials are the product of our development and application of a quantitative procedure to identify and prioritize potential regional haze control strategies for Class I areas failing to meet visibility goal objectives. Additionally, we have addressed as many of the comments on the draft control strategy analysis plan as submitted to Alpine (April 25 and later) as we have determined to be within the scope of our original proposal to CENRAP.

To facilitate subsequent use of this methodology by CENRAP or others, this Final Report describes the various analytical steps and provides examples of this procedure (both in the body of the report and in supporting in appendixes). Document appendices and relevant technical support information have archived on the Alpine Geophysics project website facilitating easy access by interested parties. The login and password to access these data is provided below.

EXECUTIVE SUMMARY

The Implementation and Control Strategies (ICS) Workgroup of the Central Regional Air Planning Association (CENRAP), together with other workgroups and state, tribal and federal agencies, have been working for more than four years gathering information for developing regional haze (RH) control strategies for pertinent Class I areas within and adjacent to the CENRAP states and tribes. In late February 2006, under the direction of the CENRAP Technical Director, Alpine Geophysics, LLC was contracted to assist the ICS in this effort. Building upon information developed by the ICS and others, Alpine was charged with developing a quantitative procedure to identify and prioritize potential RH control strategies to be tested by CENRAP modelers. Alpine formulated a methodology for constructing control strategy recommendations based on presently available information and submitted a Work Plan detailing this approach to the ICS/CENRAP leadership for review and approval.

Using the results of preliminary and more recent CENRAP visibility projection modeling together with current information on the composition of visibility-impairing fine particulate aerosols at 22 Class I monitors, Alpine identified residual visibility progress 'increments' that potentially require additional regional and/or subregional emission reductions to achieve visibility goals[1]. We synthesized pertinent 'attribution of haze' documents, CENRAP CAMx/CMAQ visibility modeling results, our own fine particulate modeling in the central U.S, and other technical reports, papers, and analyses bearing directly on the quantification of emissions-source/visibility-receptor impacts at the ten CENRAP Class I and twelve adjoining areas.

Complementing this task, we synthesized a number of recent regional modeling studies helpful in relating emissions reductions of visibility precursors (e.g. SO_2, NO_X) in upwind source regions (Areas of Influence or AOIs) to the improvement in visibility (in deciviews or Mm^{-1}) at downwind Class I areas. Figures ES-1 and ES-2 present ‘level 1’ AOI plots for sulfate and nitrate impacts at the Big Bend, Guadalupe, Wichita Mountains, Breton Island, Voyageurs, and Boundary Waters Class I Areas, respectively. Three distinct levels of AOI have been estimated for each visibility precursor and Class I areas, but the controls most likely to be considered for modeling will be drawn from the closest (i.e., AOI level 1 or AOI-1) area of influence for each Class I area/visibility precursor pair.

[1] We use the term ‘increment’ to denote the difference between the modeled visibility at a Class I area in 2018 compared to the value based on the Reasonable Progress Goal (RPG) glide path, evaluated at the same time period. A positive increment means that the modeled visibility at the Class I area is ‘poorer’ than the level associated with the linear FPG glide path. Accordingly, CENRAP may wish to consider recommending additional precursor controls to ameliorate such a positive visibility increment. In contrast, a negative increment suggests that the modeled growth and emissions controls by 2018 may produce better visibility conditions at the monitor when compared to the linear glide path.

We then deduced from available regional modeling studies 'rules of thumb' relating percentage or tonnage reductions in visibility reducing precursors (e.g., SO_2, NO_X, ammonia, and VOCs) on the expected impact on visibility downwind. These 'rules of thumb', i.e., source-receptor relationships, were essential in estimating the amounts of incremental precursor emissions reductions in regions upwind of each of the various Class I areas that CENRAP modelers should consider in the prescription of initial RH control strategy simulations.

Once an emissions reduction target was determined for each Class I area showing visibility projections above the uniform rate of progress line (i.e., a positive visibility increment), we applied a master list of controls on sources within the Class I AOIs to formulate the CENRAP Control Strategy plan, including cost-effectiveness as a key element.

Alpine's analysis of the most recent CENRAP visibility projection data identified six Class I areas within the CENRAP domain whose projected visibility falls above the uniform rate of progress line (i.e., a projected positive visibility increment). On this basis, we quantified their associated AOIs, emission reduction estimates for reaching 2018 reasonable progress objectives, and potential incremental emission reductions worthy of annual CMAQ/CAMx modeling. For each area, sulfate and to a lesser extent, nitrate reductions were shown to be most beneficial during the 20 percent worst visibility days in 2002.

As each of these areas (and all of the other Class I AOIs in the CENRAP domain) are dominated by EGU SO_2 and NO_X emissions and many of the Class I area AOIs intersect with States currently excluded by the EPA CAIR rule, a region-wide strategy for additional EGU emission reductions at CAIR levels for the non-CAIR EGUs may be beneficial to each Class I area in the CENRAP domain projected below the uniform rate of progress line. An alternate intra-state trading permutation of this regional approach is also recommended for review by CENRAP.

In lieu of a single regional control option applied consistently across the entire CENRAP domain, individual subregional control applications are proposed to reduce emissions within certain Class I area AOIs. Based on the single precursor emission reduction target calculations defined by the ICS, subregional control strategies can be defined for three of the Class I areas projected to be above the reasonable progress glide path[2]. In each case, the marginal cost curves (based on the application of all available control options on all controllable industries and source types) allow the selection of control technologies which attains the ICS defined, AOI-1 specific emission reduction targets.

However, the application of incremental control on all controllable point and area sources within certain AOIs still fails to meet the visibility objectives of three Class I areas modeled to be above the reasonable progress glide slope. In fact, as a result of the implementation of the exhaustive list of additional controls in each primary AOI, Alpine has determined that these three Class I areas[3] will be unable to achieve a level of emissions reduction necessary to bring these areas under the reasonable progress line. Influences such as incrementally uncontrollable source categories, cost-effectiveness limitations and international and inter-RPO emissions transport are barriers that prevent strategies from being configured for these Class I areas within the confines of the CENRAP domain.

[2] These areas include Boundary Waters, Wichita Mountains, and Voyageurs.

[3] These areas include Big Bend, Breton Island, and Guadalupe Mountains.

Although application of the exhaustive list of available control technologies to sources within the AOIs for each of the Class I areas failing to achieve ICS identified emission reduction targets, emission reductions beyond the base case should not be forsaken as a result. Indeed, *significant emission reductions may be warranted* in order to prepare impacted States and tribes for future attainment demonstrations where these measures may set the basis for defining and meeting future progress goals.

It should be noted that although this report and associated material includes controls for particular sources or source categories as options to consider for further photochemical modeling, it does not necessarily indicate that they will be modeled, and does not imply that these strategies ultimately will be implemented.

Finally, while the this methodology was developed and tested for regional haze control programs, with very minor adaptation, the same methods can be used effectively to aid in the design of regional 8-hr ozone and annual $PM_{2.5}$ NAAQS attainment strategies.

Figure ES-2. Level I Areas of Influence (AOI-1) for Nitrate Associated with the Big Bend, Guadalupe, Wichita Mountains, Breton Island, Voyageur, and Boundary Waters Class I Areas.

1.0 INTRODUCTION

The Implementation and Control Strategies (ICS) Workgroup of the Central Regional Air Planning Association (CENRAP), together with other workgroups and state, tribal and federal agencies, have worked for more than four years in developing the foundation for constructing regional haze (RH) control strategies for pertinent Class I areas (Table 1-1) within and adjacent to the CENRAP states and tribes (Seltz, 2006a,b; Anderson; 2005; Sharp and Anderson, 2005). In late February 2006, Alpine Geophysics, LLC (AG) was contracted to assist the ICS in these ongoing efforts. Specifically, using information developed by the ICS and others, AG was charged with developing a quantitative procedure to identify and prioritize potential RH control strategies to be tested by CENRAP modelers. Alpine formulated a methodology for constructing control strategy recommendations based on presently available information and submitted a Work Plan detailing this approach to the ICS/CENRAP leadership for review (Tesche and Stella, 2006).

Based on comments received, the approved Work Plan was implemented, culminating in the quantitative methodology for identifying potentially viable regional haze control strategies for the CENRAP states and tribes. Using the most pertinent aerometric, emissions and air quality modeling data available, we implemented this methodology and, in this report, present a set of recommendations for regional haze precursor emissions reduction strategies. These recommendations, once reviewed and refined by the ICS and Modeling workgroup, will be passed on to the CENRAP Emissions and Air Quality Modeling contractors (ENVIRON International Corporation and the University of California, Riverside) for quantitative testing with the SMOKE/CMAQ/CAMx regional modeling systems.

To facilitate subsequent use of this methodology, this report describes the various analytical steps and provides examples (both in the body of the report and in supporting appendixes). In addition, relevant technical support information, data sets, and analysis software have been supplied to CENRAP for posting on their project website for access by interested parties.

1.1 Study Overview

Preliminary (Typ02a) and more recent (Typ02b) modeling projections from the CMAQ Base18b/Typ02 scenarios (Morris et al., 2006b) have indicated that some Class I areas within or near the CENRAP domain may achieve the 2018 Reasonable Progress Goals (RPG) under current 'on-the-books' and 'on-the-way' controls while others may not unless additional emissions reductions are implemented (see Figures 1-1 and 1-2). As shown in Figure 1-1, six CENRAP Class I Areas (Big Bend, Guadalupe, Wichita Mountains, Breton Island, Voyageur, and Boundary Waters) are projected, by the latest CMAQ modeling, to have somewhat higher visibility metrics (deciviews) when compared to the 2018 RPG glide paths. While Boundary Waters does not explicitly appear in Figure 1-1 due to data base insufficiencies, recent modeling by various RPOs suggests that Boundary Waters responds similarly to Voyageurs. Accordingly, it is thus included as one of the six projected Class I areas where additional precursor controls might be considered by CENRAP/ICS.

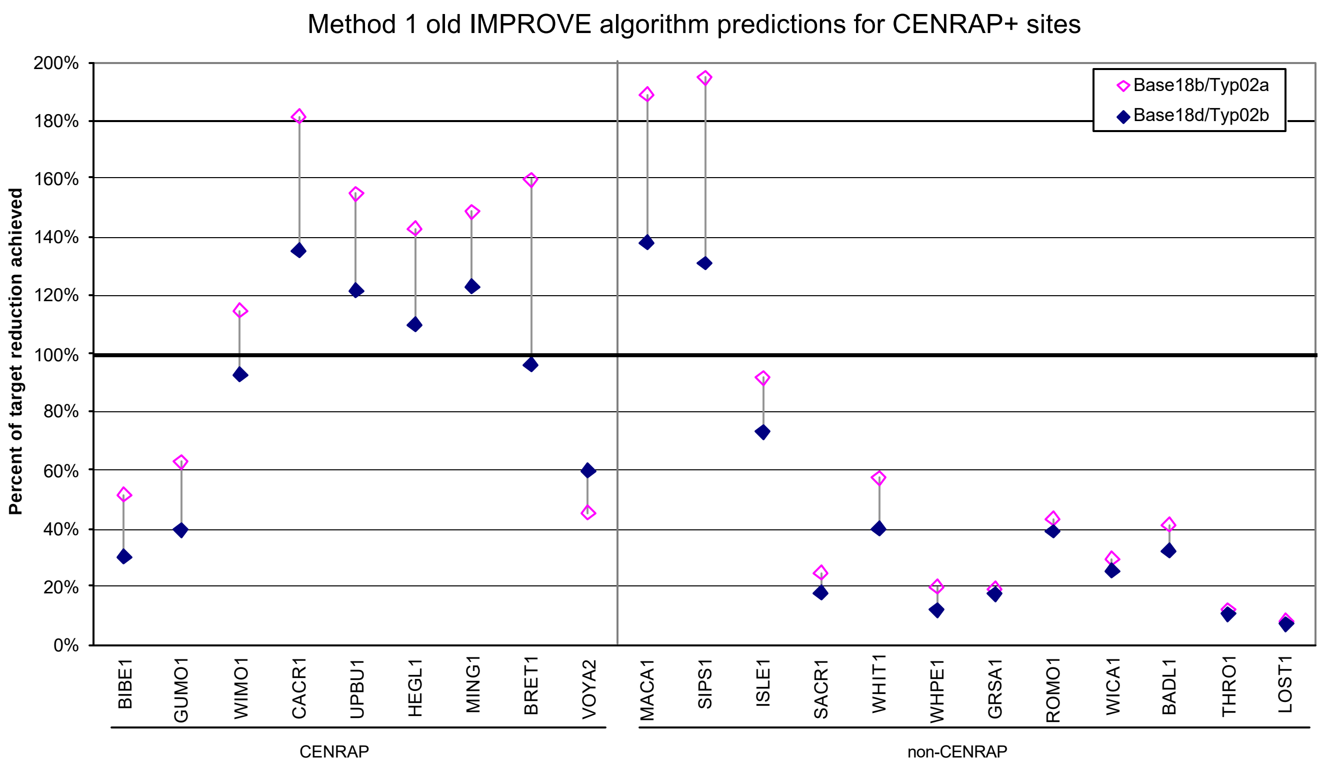

Figure 1-1. Current Visibility Projections (Base 18d/Typ02b) at CENRAP and Other Class I Sites (Source: Morris et al., 2006b).

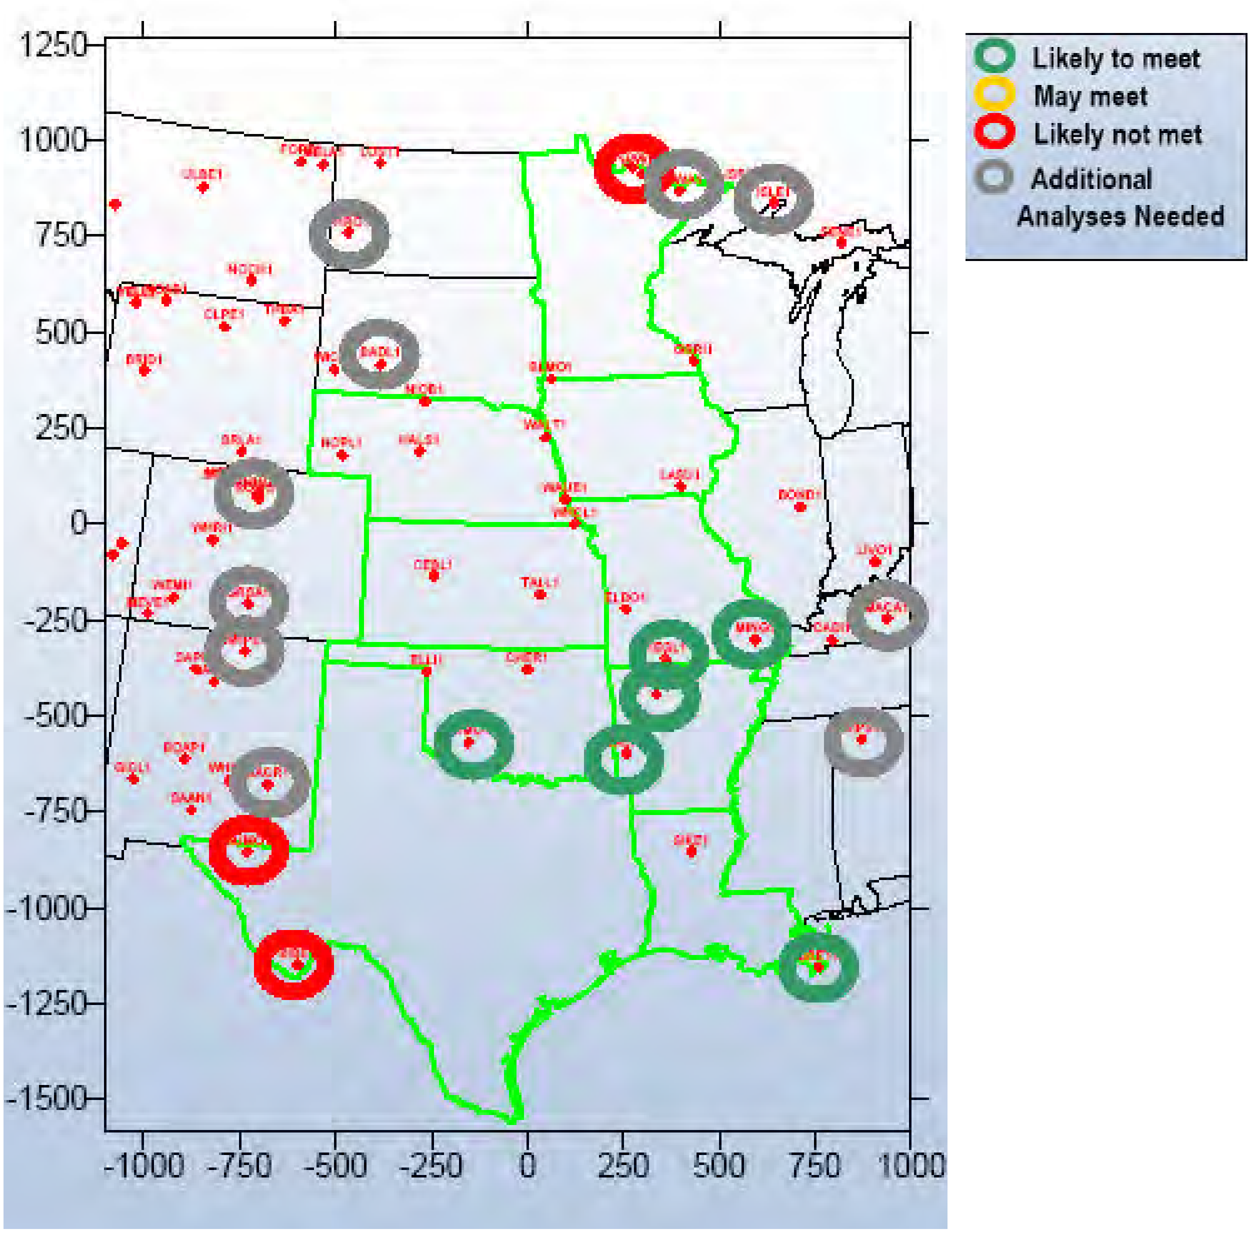

Figure 1-2. Preliminary Visibility Projections by State (Source: Morris et al., 2006b)

To prepare for the modeling of potential additional control strategies, an intensified effort has been undertaken by the ICS work group over the past two years to 'set the stage' for this activity (see for example ICS, 2005, Seltz, 2006). Consonant with these plans and on behalf of CENRAP, the ICS workgroup seeks to integrate focused contractor support with ongoing workgroup activities to accomplish the following objectives:

> Analyze existing regional haze modeling inventories developed by CENRAP, the States, tribes, and other RPOs;

> Synthesize available and pertinent air quality and meteorological data and recent 'attribution of haze studies' by CENRAP and the other RPOs;

> Review preliminary 2018 RPG modeling by CENRAP and other RPOs to identify the key Class I areas for which additional emissions reductions may be needed;

> Develop a prioritized set of regional and subregional precursor emissions control scenarios aimed at achieving the RPG at the CENRAP Class I areas; and

> Monitor the initial 2018 control strategy modeling performed by the CENRAP modeling team to ascertain whether subsequent strategies need to be refined or new strategies developed.

The project Work Plan (Tesche and Stella, 2006) describes in detail how these objectives have been addressed in cooperation with ICS and CENRAP.

1.2 Approach, Assumptions, and Constraints

Development of recommendations for potential CENRAP regional haze control strategy simulations was a three-step process. First, we assembled available information useful in quantifying the reductions in fine particulate aerosol concentrations needed to satisfy CENRAP's preliminary regional haze visibility projections. Naturally, the principal focus was on the Class I areas within the CENRAP region that were estimated to not meet the 2018 Reasonable Further Progress (RFP) glide paths. Based on preliminary and more recent modeling (Morris et al., 2006b), some Class I areas did meet the 2018 RFP glide paths while others did not. As new visibility projections for the Class I areas become available, the ICS may wish to re-examine this study's strategy recommendations in order to account for more up-to-date estimates.

The second step involved developing Areas of Influence (AOIs) upwind of each Class I area within which common 'visibility precursor-Class I receptor' impacts could be aggregated into similar groupings. We used results of numerous statistical and pattern recognition studies, as well as pertinent regional photochemical aerosol modeling by Alpine and ENVIRON scientists as well as other groups (including the RPOs). These analyses culminated in quantitative 'rules of thumb' relating emissions reductions of visibility-impairing precursors (in tons/day) to ambient aerosol concentrations at each of the ten (10) CENRAP Class I monitors. We also developed these quantitative source-receptor relationships for a dozen Class I areas in adjoining RPOs to the extent possible give available data, project resources and schedule. As of this writing,

CENRAP Modeling contractors are still performing focused particulate source apportionment modeling (CAMx PSAT) over the region. Once this work is completed, the ICS may wish to re-examine our methodology and strategy recommendations to determine if refined source-receptor relationships alter in any way our present findings and conclusions.

The third step synthesized the results of the first two, together with information on the estimated 2018 CENRAP emissions inventory and the cost-effectiveness of various controls, to deduce a prioritized set of RH control strategies containing elements of both regional emissions reductions and targeted reductions within the AOIs closest to those six CENRAP Class I areas for which positive visibility increments were estimated (Morris et al., 2006b). We used the most up-to-date modeling inventory supplied by the CENRAP Modeling contractor; however, the current round of inventory corrections and refinements will undoubtedly lead to refined emissions data sets in coming months. Thus, another constraint limiting the 'shelf-life' of this study's recommendations is the accuracy and representativeness of the draft 2018 emissions data used in developing this plan's precursor emissions control recommendations.

While project work scope precluded re-running the strategy development process described in this report with updated CAMx/PSAT and CMAQ visibility projections expected in late May or early June 2006, the methodological tools are cataloged and archived should the ICS wish to undertake this activity at a later time.

1.3 Structure of Report

This report is organized as follows. Section 2 provides a brief background on the Regional Haze Rule (RHR) and the role that CENRAP and the other RPOs are playing in developing strategies that will show progress in meeting Reasonable Progress Goals by 2018. We also discuss key considerations that influence the design of regional and subregional control strategies in the context of the RHR. Our technical approach is summarized in Section 3. Details of our methodology are given in the Work Plan (Tesche and Stella, 2006a). In Section 4 we describe the information available to characterize the daily and annul composition of $PM_{2.5}$ constituents (sulfate, nitrate, elemental carbon, etc) at the various IMPROVE monitors in the CENRAP and adjoining Class I Areas. We also describe the method to relate the modeled deciview (dv) or extinction coefficient (Mm^{-1}) – derived from the most recent CENRAP visibility projection modeling – to the fine particulate component concentrations at each Class I area expressed in units of mass per unit volume (i.e., $\mu g/m^3$).

Section 5 presents the quantitative methods for converting these concentration increments (whose reductions will likely achieve the individual Class I areas visibility goals by 2108) to mass emissions rate reductions for the primary particulate aerosol precursors, NO_X and SO_2. In addition, the section describes the methods used to construct Area of Influence (AOI) domains surrounding each Class I area based on historical data analysis, statistical pattern recognition studies, and various photochemical and aerosol modeling studies performed throughout the eastern U.S. by Alpine, ENVIRON, state, tribal and federal regulatory agencies, the Southern

Appalachian Mountains Initiative (SAMI), the RPOs, and university scientists[4]. In Section 6, the information developed in the two preceding chapters is used, together with original analyses of the 2018 regional haze inventories and control technology cost-effectiveness information, to construct a series of curves from which quantitative estimates of suggested precursor emissions controls (within specific AOIs) are developed for each Class I Area in CENRAP projected above the reasonable progress glide path in 2018. Our summary and recommendations are presented in Section 7.

1.4 Technical Support Resources

Several technical appendixes and support documents are provided to accommodate the extensive tabular and graphical information underpinning our methodology. Some appendixes constitute simple tabular data or emissions summaries (in Excel format) while other appendixes contain information in PowerPoint or Adobe Acrobat formats. Finally, the study's Work Plan, Final Report, Technical Support Documents (i.e., the appendixes and other materials), and a compilation of science reports, professional papers and journal articles have been transferred to CENRAP for uploading to their project ftp site.

[4] The AOI methodology was carried out by Dr. Jim Wilkinson of Alpine whose recent Ph.D. original research and Dissertation from Georgia Tech focused on the development of the AOI methodology for regional haze, ozone, and $PM_{2.5}$ control strategy modeling in the eastern U.S.

2.0 CONTEXT FOR REGIONAL HAZE STRATEGY DEVELOPMENT

Section 169A of the Clean Air Act (CCA) sets forth a national goal for visibility which is the "prevention of any future, and the remedying of any existing, impairment of visibility in Class I areas which impairment results from manmade air pollution." In 1999, EPA published a final rule to address a type of visibility impairment known as regional haze (64 FR 35714). The Regional Haze Rule (RHR) requires States to submit implementation plans (SIPs) to address regional haze visibility impairment in federally-protected parks and wilderness areas (i.e., the Class I scenic areas identified in the Clean Air Act). The 1999 rule was issued to fulfill a long-standing EPA commitment to address regional haze under the authority and requirements of sections 169A and 169B of the CAA. In essence, the RHR prescribes that states are to make efforts to improve visibility in 156 Class I areas at such rates that "natural conditions" would be achieved in each area by 2064. A 'reasonable rate of progress' corresponds to linear improvement in visibility, as characterized in units of deciview (dv), between current conditions during the base period of 2000-2004 and natural conditions at the end point of 2064. It is important to note that a modeled 2018 visibility condition at a Class I monitor – numerically equaling the monitor's RPG goal – is not meant to imply 'attainment' of any standard nor is lesser modeled progress in reaching a particular RPG indicative of 'nonattainment'. Indeed, as will be discussed later, progress in attaining visibility improvements at some CENRAP monitors (in Texas and Minnesota) may be thwarted by substantial contributions of visibility precursors from Mexico and Canada over which the States and Tribes have no direct control.

2.1 Role of CENRAP and the Other Regional Planning Organizations (RPOs)

CENRAP is one of five Regional Planning Organizations (RPOs) that have responsibility for coordinating development of State Implementation Plans (SIPs) and Tribal Implementation Plans (TIPs) in selected areas of the U.S. to address the requirements of the Regional Haze Rule (RHR). The RHR visibility SIPs/TIPs are due in 2007/2008. CENRAP modeling results may also form the regional component for 8-hour ozone and fine particulate ($PM_{2.5}$) SIPs/TIPs that are also expected to be due in 2007/2008. CENRAP is a regional partnership of states, tribes, federal agencies, stakeholders and citizen groups established to initiate and coordinate activities associated with the management of regional haze and other air quality issues within the CENRAP states. The CENRAP region includes states and tribal lands located within the boundaries of Arkansas, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, Oklahoma and Texas.

The regional emissions and fine particulate/visibility modeling for CENRAP is being performed by the Emissions and Air Quality Modeling Contractor that is comprised of staff from ENVIRON International Corporation (ENVIRON) and the University of California, Riverside (UCR). The ENVIRON/UCR team performs the emissions and air quality modeling simulations for states and tribes within the CENRAP region, providing analytical results used in developing implementation plans under the EPA Regional Haze Rule. Alpine Geophysics serves as the Technical Advisor to CENRAP, working interactively with the emissions and air quality modelers at ENVIRON and UCR.

2.2 Considerations in Designing Regional Haze Control Strategies

Where the year 2018 base case modeling does not show an acceptable regional haze or visibility glide slope for a Class I area within or adjacent to the CENRAP domain, additional (and possibly substantial) emission reductions will most likely be required to show reasonable progress in meeting 2108 visibility goals. Due to the unique location, meteorology, and emission sources within an area of influence to each Class I area, individualized control strategies reducing emissions from the remaining residual sources or source types are most likely to achieve required results. It is highly unlikely that a single cost effective "across-the-board" reduction strategy will achieve the visibility goals for every Class I area.

Although emissions located within areas of direct proximity to Class I area monitors will generally have the greatest influence on attaining visibility goals, these sources may not be the only ones with significant impact on the air quality. Using methods such as localized geography analysis (e.g., within 200km of Class I area boundaries) to initially identify source types and pollutants with the greatest influence will only provide part of the picture. In reality, other methods will also provide information related to transport sources impacting a Class I area. These other methods can include back trajectory analysis, residence time probability, source apportionment modeling (PSAT, OSAT, TSSA), and the cause of haze (COH) studies performed in the past two years by the various RPOs including CENRAP. Other geographic studies, such as identifying sources that have an impact on more than one Class I area are also warranted. These methods can also help to limit or refine geography, pollutants, or source categories of interest for additional reduction potential in each Class I area.

Using these techniques in addition to review of the future year base case emissions inventories and assigned control strategies will allow CENRAP and the ICS Workgroup to further define incremental reduction allowing for the attainment of Class I area air quality or visibility objectives.

2.3 Resources Available to this Study

The reference section of this report and the technical discussions in Sections 4 through 6 identify the major data bases, reports, modeling output files and other resources used in this study. Certain regional modeling and data analysis studies performed by the RPOs and their contractors were particularly useful in developing source-receptor relationships for the various Class I areas. These include: (a) the recent (25 April 2006) visibility projections for the CENRAP and adjoining RPOs recently described by Morris et al. (2006b), (b) monitoring information for the various Class I areas of interest, summarized on the IMPROVE website, and (c) the most recent 2018 SMOKE emissions inventory developed for CENRAP by various state, tribal and federal agencies and contractors.

3.0 TECHNICAL APPROACH

As described in the Work Plan (Tesche and Stella, 2006b), our technical approach consisted of six (6) tasks which are summarized briefly here to provide background for the more detailed technical discussions given in subsequent chapters.

<u>Task 1: Synthesize Relevant Regional Haze Aerometric Analyses:</u> The objective of Task 1 was to synthesize pertinent 'attribution of haze' documents, CENRAP CAMx/CMAQ visibility modeling results, and other technical reports, papers, and analyses bearing directly on the quantification of emissions-source/visibility-receptor impacts at the 10 CENRAP Class I areas and adjoining areas. This Task was aimed at quantifying what is known about source-receptor relationships at the 10 CENRAP Class I areas on the basis of emissions, air chemistry and meteorological statistical analyses and receptor modeling studies.

<u>Task 2: Review Existing Inventories and Control Scenario Strategy Options:</u> This involved a concise summarization of existing regional haze modeling inventories and associated local, State, Tribal and Federal control programs to determine available incremental controls on sources or source types affecting visibility increments (i.e., differences between the modeled 2018 visibility level and the RFP glide slope for the particular Class I Area). In addition, we attempted to confirm future year control plans and reduction scenarios necessary to accomplish incremental reduction analysis. The product of this effort was a set of suggestions for alternate incremental control strategies based on analysis of available emissions, monitoring, and modeled data.

The Task 2 review was conducted in a top down fashion starting with an analysis of the major source categories in the domains of interest (based on results from Tasks 1 and 3) to determine which major categories have the highest residual contribution to the area. Once the highest source types were identified, subcategories within those source types were reviewed. In addition to reviewing the residual emission categories in the future year base, we also identified reductions that have already occurred within each category or at specific units. This allows CENRAP to determine if certain source categories that have yet to be controlled under the base case have the potential for reduction or if source types already reduced have reached the full cost-effective potential. Finally, unit level tables of emission comparisons from 2002 to 2018 were developed that facilitate ICS's review of existing emission reductions and the assignment of new cost-effective controls to units using the best control for the scenario.

Once the list of potential sources available for reduction were identified, we used relevant control strategy information extracted from EPA's AirControlNET (Pechan, 2005) and other sources to further define the most cost-effective strategies for these sources. Since AirConrolNET does not allow for the interactive processing of new inventories (it comes preconfigured with inventories and control strategies applied), this extract was performed outside of the AirConrolNET model to assign incremental control programs. Finally, we ran every accessible control strategy against the identified source list to develop incremental cost curves necessary to design command and control or cost-effectiveness based control strategies by source or domain. This master list of controls was then used in the development of our final control strategy recommendations.

Task 3: Synthesize Relevant Regional Haze Source Attribution Modeling: Complementing Task 1, work under Task 3 was aimed at synthesizing key results from recent regional modeling studies helpful relating emissions reductions of visibility precursors (e.g. SO_2, NO_X) in upwind source regions to the improvement in visibility (in deciviews or, alternatively, in Mm^{-1}) at downwind Class I. More specifically, we attempted to extract from available regional modeling studies useful 'rules of thumb' relating percentage or tonnage reductions in visibility reducing precursors (e.g., SO_2, NO_X, ammonia, and VOCs) on the expected impact on visibility downwind. These 'rules of thumb' or source-receptor relationships were essential in estimating the amounts of precursor emissions to be reduced in regions upwind of each of the various Class I areas.

Task 4: Develop CENRAP Control Strategy Plan: The objective of Task 4 was to assemble the findings and technical work products from Tasks 1 through 3, supplemented with any additional information provided by the ICS Workgroup or CENRAP Modeling contractors, and construct the CENRAP Control Strategy Plan. As described in subsequent chapters, this plan addresses feasible regional haze control strategies with each one including both regional and sub-regional elements.

More specifically, using the results of the most recent CENRAP visibility projection modeling (Morris et al., 2006b), we identified six Class I areas that potentially require additional regional and/or subregional incremental emission reductions to achieve reasonable progress visibility goals. Once an emissions reduction target was determined for each Class I area, we used the master list of controls developed in Task 2 to formulate the CENRAP Control Strategy plan, including cost-effectiveness as a key element. This plan identifies specific source categories (e.g., SIC, SCC, plant ID), and emissions reductions to be implemented. The specificity of the prescribed control scenarios recommended in the plan is sufficient to allow the CENRAP modeling contractors to readily implement the suggested changes through the SMOKE model input stream.

The CENRAP Control Strategy Plan is intended to identify the specific sources and/or source categories where additional control is available with emphasis on known incremental reductions first (e.g., BART). Using this plan as a starting point, CENRAP is equipped to assess the present strategy recommendations and identify any new assumptions (recent or new facility configurations, updated control strategy information from the states and tribes), emergent data sets (e.g., CAMx PSAT modeling; updated 2018 CMAQ visibility projections), corrected modeling inventories, and so on that were unavailable during the three-week time period when this plan was developed.

Task 5: Review Control Strategy Plan With ICS: The project team participated in a teleconference call on 13 April 2006 with the CENRAP ICS Workgroup to discuss the study methodology, findings, and recommendations.

Task 6: Final Report: To the maximum extend feasible within this project's work scope, we incorporated written responses from CENRAP on the 10 April draft report, culminating in this final document.

4.0 ESTIMATION OF RESIDUAL VISIBILITY IMPROVEMENT NEEDS

The estimation of residual visibility improvement needs (i.e., the aerosol species concentration reductions [mass per unit volume] at each Class I monitor) was performed through three activities: (a) literature review and synthesis, (b) analysis of current CMAQ visibility projections and IMPROVE measurements at the Class I sites, and (c) integration of this information into a computational scheme for use in later tasks.

4.1 Literature Review and Synthesis of Pertinent Source-Receptor Information

Our synthesis of *existing* source-receptor information for the CENRAP and adjacent Class I area was guided by the following set of questions for which specific answers were sought in recent reports, papers, RPO and science meeting presentations, as well as recent one-atmosphere modeling studies. These core questions include:

> **What aerosol components are responsible for haze?**
- What are the major components for best, worst and average days visibility days across the CENRAP domain and how do they compare?
- How variable are they episodically, seasonally, inter-annually?
- What site characteristics best group sites with similar patterns of major components?
- How do the relative concentrations of the major components compare with the relative emission rates nearby and regionally?

> **What is meteorology's role in the causes of haze?**
- How do meteorological conditions influencing the CENRAP Class I areas differ for best, worst and typical haze conditions?
- What empirical relationships are their between meteorological conditions and haziness?
- How well can haze conditions be predicted solely using meteorological factors?
- What characteristics best group CENRAP Class I sites with similar relationships between meteorological conditions and haze?
- How well can inter-annual variations in haze be accounted for by variations in meteorological conditions at the CENRAP Class I areas?

> **What are the emission sources responsible for haze?**
- What geographic areas are associated with transported air that arrives at sites on best, typical and worst haze days in the CENRAP region?
- Are the emission characteristics of the transport areas consistent with the aerosol components responsible for haze?
- What do the aerosol characteristics on best, typical and worst days indicate about CENERAP or upwind emissions sources?
- What does the spatial and temporal pattern analysis indicate about the locations and time periods associated with sources responsible for haze?
- What evidence is there for urban impacts on haze at the CENRAP Class I areas and what is the magnitude and frequency when evident?

- What connections can be made between sample periods with unusual species concentrations and activity of highly sporadic sources (e.g. major fires, dust storms)?
- What can be inferred about impacts from sources in other states, other RPOs and other countries, particularly Mexico and Canada?
- What refinements to default natural haze levels can be made using ambient monitoring and emission data?

> **Are there detectable and/or statistically significant multi-year trends in the causes of haze?**
- Are the aerosol components responsible for haze changing?
  Where changes are seen, are they the result of meteorological or emissions changes?
- Where emissions are known to have changed, are there corresponding changes in haze levels?

With these questions in mind, we surveyed the literature relevant to the CENRAP Class I areas in order *to summarize*:

> **Characteristics of Each CENRAP Monitoring Site**
- Their representation of the Class I area and nearby Class I areas;
- Relationship to terrain features, bodies of water, etc;
- Proximity to major point sources, cities, etc.

> **Meteorological Characteristics of Each CENRAP Monitoring Site**
- Expected mesoscale flow patterns of interest (sea/land breeze, mountain/valley winds, convergence zones, nocturnal jets, etc.);
- Orographic precipitation patterns (i.e. favored for precipitation, or in rain-shadow);
- Inversion layers;
- Potential for transport from cities and other significant sources/source areas.

> **Visibility-Aerosol Related Data Analyses**
- Descriptive statistics and interpretation for aerosol data- individual components and reconstructed extinction
- Key aerosol species component spatial and seasonal patterns (e.g., Best 20%, middle 60%, worst 20% reconstructed extinction days and seasonal patterns by site)
- Spatial and seasonal patterns of aerosol components frequency distributions.
- Aerosol component data in light of emissions sources, monitoring site settings, back trajectories
- Results of cluster, CART, and other pattern-recognition analyses to group sites with similar patterns in aerosol component contributions to haze

> **Back Trajectory Analyses**
  - Results of back trajectory end point data for each CENRAP Class I area;
  - Back trajectory summary statistics residence time by season, best 20% and worst 20% reconstructed extinction and aerosol components for all CENRAP Class I areas;
  - Conditional probability maps for high and low extinction and aerosol components.
  - Results of emissions density maps giving location information, site setting information, etc., and
  - Mesoscale meteorological analyses complementing back trajectories.

Of course, complete answers to all these questions could not be developed in the course of this three week study; however, sufficient information was available that, when distilled into key tabular and graphical summaries, provided a solid foundation for continued efforts in Task 1 and especially Task 2 (discussed in Section 5). Key reports and modeling summaries synthesized during this initial review were supplied to CENRAP for uploading onto the CENSARA project website for easy access by interested CENRAP workgroup members or stakeholders.

4.2 Preliminary Visibility Estimates for Class I Areas

The visibility projection estimates for 2018 available at the time this study was performed (Typ02a) were developed in early 2006 by ENVIRON/UCR and presented at the February CENRAP meetings in Baton Rouge, LA. Appendix B presents these preliminary visibility projections for the ten (10) CENRAP Class I areas and the twelve (12) outlying Class I areas in the WRAP, MRPO, and VISTAS domains. After the draft report had been prepared, Morris et al., (2006b) published an updated set of visibility projections (Typ02b). Given the importance of using the most up to date projections possible, where feasible we repeated our technical work using the updated projections (See Table 1-1 for a visual comparison of the differences). Table 4-1 lists the following information derived from these more recent CENRAP projections of Morris et al., (2006b).

> Visibility (in dv) on the 20% worst days in 2002;

> The 2000-2004 visibility baseline (in dv);

> The 2018 visibility goal (in dv) based on the requirements of the Regional Haze Rule;

> The CMAQ-forecasted 2018 visibility levels on the 20% worst days;

> The ‘increment’ in visibility, expressed in dv (calculated as the difference between the 2018 goal and the 2018 forecast. Negative values (presented in red in Table 2) denote that additional visibility improvement needed to achieve the desired 2018 progress goal; and

> The ‘increment’ in visibility, expressed in units of inverse mega-meters (Mm^{-1}).

Table 4-1. Reasonable Progress Goal Estimates and ‘Increments’.

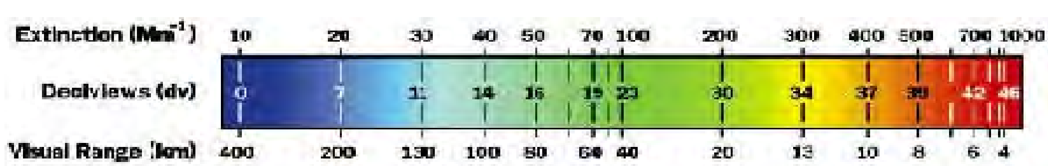
The relationship between deciviews (dv) and inverse megameters (Mm^{-1}) is described in detail by Malm, (1999). Equation 4-1 defines the Haze Index (HI):

$$HI = 10 \ln(b_{ext}/10) \qquad (4\text{-}1)$$

where HI is the haze index (deciviews [dv]) and b_{ext} is the light extinction coefficient (Mm^{-1}). Thus, one deciview is approximately equal to 11.05 Mm^{-1} and a change of one dv represents a change of approximately ten percent in b_{ext}, “which is a small but perceptible scenic change under many circumstances”. Malm (1999) provides the following graphical representation between the extinction (Mm^{-1}), deciviews, and visual range (km):



The measured light extinction at the Class I areas for the 20% worst days each year are available at http://vista.cira.colostate.edu/views/web/AnnualSummaryDev/Composition.aspx, the IMPROVE site. The most recent measured extinction values (in Mm^{-1}) for the various Class I monitors are listed in Table 4-2, presented in Figure 4-1, and also given in Appendix B. For the most part, IMPROVE extinction measurements for the 20% worst days are available for 2004, the most recent year analyzed. These data are presented as extinction totals for the individual visibility-impairing chemical species: sulfate; nitrate; organic mass; elemental carbon; soil; and

coarse mass. Table 4-3 lists the fractional extinction for each chemical species. Finally, the IMPROVE data for each species at the 22 Class I monitors are presented as a function of time in the appendices to this document. These time series plots reveal the seasonal and daily variation in the visibility-impairing components throughout the year at teach site. Figures 4-2 and 4-3 present the absolute and fractional extinction values listed in Tables 4-2 and 4-3 in the form of stacked bar charts for ease of comparison.

4.3 Estimation of Visibility-Impairing Concentration Increments

The information in Tables 4-1 through 4-3 as well as other data provided in the appendices of this document was used to estimate the extent to which additional visibility-impairing precursor emissions reductions might be needed on the basis of current estimates of the projected positive increments and the chemical composition of fine particulate aerosol at the six CENRAP Class I monitors on the worst 20% days. The next step was to transform the visibility increment estimates into concentration increment estimates based on current IMPROVE algorithms. Using the modeled visibility increment (Mm^{-1}) estimates and annual f(RH) values (Table 4-1) together with the measured sulfate, nitrate, OC, EC, soil, and course mass fractions from the IMPROVE Class I monitors (Tables 4-2 and 4-3), we deduced the atmospheric concentrations of the six species groups ($\mu g/m^3$) using the standard IMPROVE equation (EPA, 2003). These concentrations were calculated assuming: (a) the required concentration reductions would be met by each precursor in proportion to the most recent IMPROVE distribution at each Class I monitor (Table 4-4); and (b) the concentration reductions would be met by each precursor individually (Table 4-5).

Table 4-3. Extinction Fraction for 20% Worst Days by Class I Area.

Following the IMPROVE methodology, the relationship between the extinction (Mm^{-1}) of an individual chemical species and the volumetric mass concentration is as follows:

$$b_{Sulfate} = 3 \cdot f(RH) \cdot [SO4]$$

$$b_{Nitrate} = 3 \cdot f(RH) \cdot [NO3]$$

$$b_{EC} = 10 \cdot [EC]$$

$$b_{OM} = 4 \cdot [OM]$$

$$b_{Soil} = 1 \cdot [Soil]$$

$$b_{CM} = 0.6 \cdot [CM]$$

$$b_{Ray} = 10\ Mm^{-1}$$

$$b_{ext} = b_{Ray} + b_{Sulfate} + b_{Nitrate} + b_{EC} + b_{OM} + b_{Soil} + b_{CM}$$

The numeric coefficient at the beginning of each equation is the dry scattering or absorption efficiency. The f(RH) term is a monthly-average relative humidity adjustment factor. The terms in the brackets are the concentrations in micrograms per cubic meter ($\mu g/m^3$) that will need to be reduced on the 20% worst days at the Class I monitor to make up for the projected visibility 'increment'.

Rearranging yields a solution for the aerosol concentrations as a function of the measured or modeled extinction:

$[SO4] = b_{Sulfate} / [3 \cdot f(RH)]$

$[NO3] = b_{Nitrate} / [3 \cdot f(RH)]$

$[EC] = b_{EC} / 10$

$[OM] = b_{OM} / 4$

$[Soil] = b_{Soil}$

$[CM] = b_{CM} / 0.6$

Note that the sulfate (SO_4) and nitrate (NO_3) components are hygroscopic because their extinction coefficients depend upon relative humidity. The concentrations, in square brackets, are in $\mu g/m^3$ and b_{ext} is in units of Mm^{-1}. The Rayleigh scattering term (b_{Ray}) has a default value of 10 Mm^{-1}, as recommended in EPA guidance for tracking reasonable progress (EPA, 2003). The effect of relative humidity variability on the extinction coefficients for SO_4 and NO_3 can be estimated in several ways, but given the scope of this analysis, we calculated annual average Class I areas-specific monthly f(RH) values (last column of Table 4-1) from the seasonal f(RH) data provided by EPA in the BART guidelines.

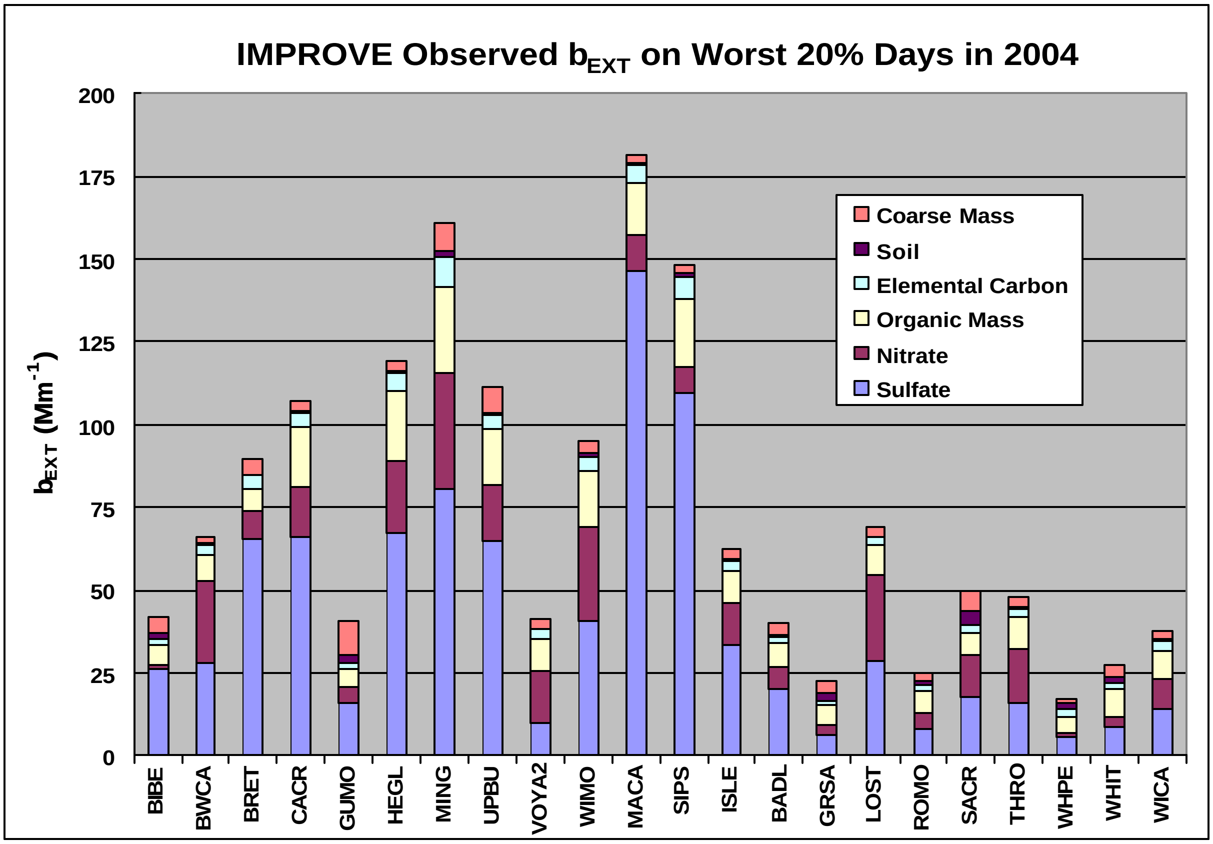

Figure 4-1. Measured Extinction Coefficients at Class I Areas Based on IMPROVE Data.

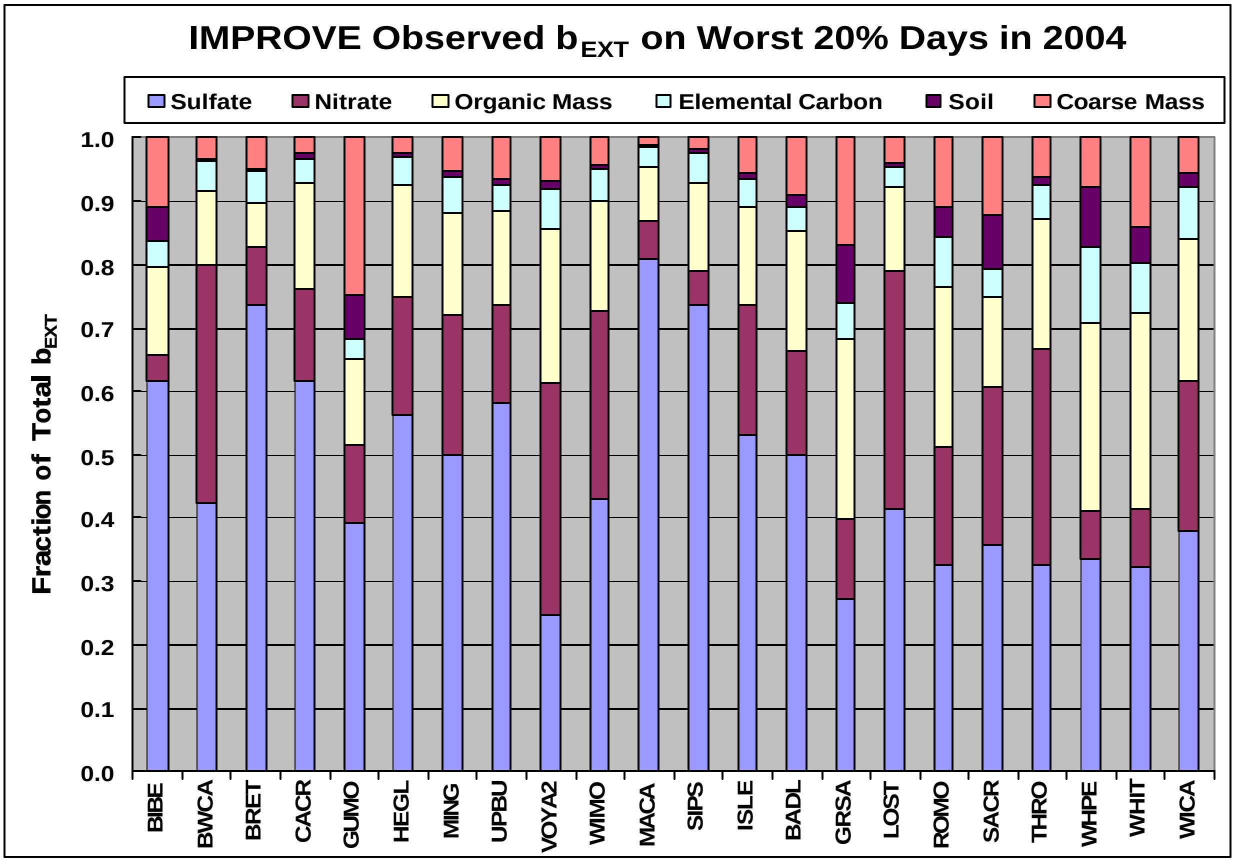

Figure 4-2. Measured Fractional Extinction at Class I Areas Based on IMPROVE Data.

5.0 ESTIMATION OF EMISSIONS REDUCTION NEEDS

5.1 Development of the Areas of Influence (AOI)

To quantify the incremental emissions reductions needed to ameliorate positive visibility increments at Class I areas, it was first necessary to identify those regions that adversely impact visibility at the Class I areas. These Areas of Influence (AOI) directly identify the source regions whose emissions impact a Class I area. Further, an AOI can also be constructed such that it provides a quantitative assessment of the impact of the emissions from a source region on such metrics as $PM_{2.5}$ concentration at a Class I area. This should not be confused with source apportionment where source regions are assigned quantitative culpability to an overall air quality metric such as sulfate concentration or light extinction. Instead, an AOI ideally describes geographically the emissions source regions and magnitude of, say, the impact that a one ton reduction in SO_2 emissions has on sulfate concentration ($\mu g/m^3$) at a Class I area.

An AOI can be constructed based on a variety of data such as: sensitivities derived from the Decoupled Direct Method (DDM) (Yang *et al.*, 1997; Mendoza *et al.*, 2000); brute force sensitivities; various forms of back trajectory analysis which examine air mass residence time (e.g., Schichtel *et al.*, 2006; DRI, 2005c); and methods that combine back trajectory analyses with such information as emissions impact potential (e.g., Raffuse *et al.*, 2005). Over the last two years, one or more of these methods has been used to construct AOIs or AOI-like diagrams for all the Class I areas of interest to this study. Therefore, it was necessary to identify, gather, and synthesize these data from the many sources so that a consistent set of AOIs could be constructed.

Appendix C is a compendium of AOI data for each Class I area of interest that could be extracted from the body of literature that is available. The first six slides of Appendix C provide examples of the data that were available to construct the AOIs – references are provided on each slide. Ultimately, the Residence Time Difference plots (DRI, 2005c), the Probability of Regional Source Contribution to Haze (PORSCH) plots (Raffuse *et al*., 2005), the Tagged Species Source Apportionment (TSSA) results (Tonnesen and Wang, 2004; UCR, 2006), and a good deal of engineering judgment were used to construct a consistent set of AOIs for each Class I area.

Residence Time Difference (RTD) plots were constructed based on Back Trajectory Residence Time (BTRT) plots. Back trajectory analyses use meteorological fields to estimate the most likely geographical path an air mass traversed to end at a particular receptor. Of note, the meteorological field can be based on interpolation of observations, modeled (e.g., from a prognostic meteorological model such as MM5), or a hybrid field based on combined modeled and observed values. The method essentially reverses the wind field, moving an air mass backward in time. Back trajectories oversimplify actual atmospheric conditions in that dispersion is ignored. Further, the potential emissions source regions that impact a receptor are underestimated given that it is impossible to track every air parcel impacting the receptor.

The BTRT estimates that were developed by DRI (2005b) and used in this study were estimated using HYSPLIT (Draxler and Hess, 1997; NOAA, 2006). HYSPLIT uses archived three dimensional meteorological fields generated from observations and short-term meteorological forecasts. The model produces a series of endpoints representing longitude, latitude, and

elevation of the parcel at one-hour intervals. BTRT plots at each site were calculated for all days, by month, and by best and worst twenty percentile days (DRI, 2005c). BTRT plots give the fraction of total hours that an air parcel resided over each specific geographical area. RTD plots were created by subtracting the map for all days at a site from the map for the 20% worst days by pollutant. RTD plots were computed for the twenty percentile worst sulfate, nitrate, organic carbon, elemental carbon, fine soil, and coarse mass days.

The worst twenty percentile sulfate RTD plots, for example, shows the difference in residence time between the worst sulfate days and all days. If the number is positive, then the residence time on the worst sulfate days is greater than on all days. The residence time difference map simply shows the areas that air was more frequently (positive numbers) passing over on worst case days compared to all days.

The PORSCH system is a suite of GIS tools that combines modeled backward wind trajectories, monitored concentrations, meteorological conditions, and emissions estimates to estimate probable regions of influence. PORSCH combines ensemble backward trajectories with chemically speciated emissions data to estimate the trajectory-emissions density-weighted area likely to impact a receptor site. PORSCH can do this for a single day or a suite of days though for purposes of this study, only data relevant to the 20% worst haze days were extracted.

As the name implies Tagged Species Source Apportionment (TSSA) uses "Tagged Chemical Species," or tracers, to track chemical transformations and transport of each chemical species or precursor species during an air quality model run. Key chemical species are identified for specific emissions source regions or emissions source categories. These tagged chemical species are tracked during all phases of the air quality modeling run (e.g., advection, diffusion, deposition, chemical transformation), and the end results are three dimensional fields in time showing source attribution of the chemical species for any grid cell in model domain. When chemical species are tagged by emissions source region, this provides valuable corroborative evidence for identifying key AOI regions.

Slides 8 through 82 of Appendix C contain the raw data that was extracted from the literature base, which served as the foundation to develop the AOIs for the ten CENRAP Class I areas. Slides 84 through 184 of Appendix C contain the raw data from which AOIs were synthesized for the nine WRAP and two VISTAS Class I areas that border the CENRAP states. Because RTD plots were available for the entire suite of twenty-one Class I areas, they served as the primary basis from which the AOIs were estimated. The RTD plots were manually examined to determine "natural break-points" in residence time difference (only positive values were considered in these plots as positive values indicate air mass residence was greatest in these geographical areas on the 20% worst haze days).

In many cases, these "natural break-points" were difficult to determine given that the scales on the RTD plots were not consistent; hence, engineering judgment was used to place a "break-point." For virtually all Class I areas, it was possible to determine at least two "break-points" and in some instances, three and four "break-points" were determined. For purposes of this effort, a "break-point" was generally placed where the residence time difference transition was on the order of a factor of ten and over large geographical areas. Little pockets of large RTD transitions, such as might occur over Lake Michigan or the Gulf of Mexico, were merged into a

larger "break-point." Once a "break-point" was determined, a hand drawn contour was placed on the plot to indicate the Level 1, 2, or greater "break-point." This was done for each of the chemical species classes: sulfate; nitrate; organic carbon; elemental carbon; fine soils; and coarse material, at each Class I area. For clarification purposes, the Level 1 "break-point" is always the smallest polygon closest to the Class I area, and subsequent Level 2, 3, or greater "break-points" cover progressively larger areas.

Once the RTD "break-points" were determined, the plots were manually compared to the supporting PORSCH and TSSA data in order to determine if a "break-point" needed to expanded, contracted, or moved. The PORSCH data were used primarily to determine if the spatial extent of a "break-point" was adequate and the TSSA data were used to determine if the areas of emissions impact potential were captured within the spatial extent of the RTD "break-points." Based on this reconciliation effort, the Level 1, 2, or greater "break-point" contours were manually adjusted on the plots. Again, a great deal of engineering judgment was used in how these data were combined. This initial effort resulted in the development of 126 plots (six pollutants times twenty-one Class I areas) consisting of one or more "break-point" contours.

Next, each plot was manually compared to the remaining plots to determine if any of the Level 1, 2 or greater "break-point" contours were similar in their geographic placement. If a set of contours from different Class I areas had similar geographic placement, the plots were combined into a single set of contours. In many cases, the "break-point" contours were again manually adjusted so that different plots could be combined into a single set representing multiple Class I areas and multiple pollutants.

This final set of manually created, combined "break-point" contours is what is referred to as the Area of Influence (AOI) for each Class I area. However, these hand drawn AOIs are useless in their current form since it would have been far too time consuming to try to manually extract the counties over which an AOI passed – a step which is necessary if one is to determine the emissions impact potential from a geographic area (i.e., AOI) that impacts a Class I site. Therefore, it is necessary to convert the hand drawn AOIs into a geocoded, electronic file.

Geocoding of the hand drawn AOIs is accomplished by first scanning the image into an electronic file. The scanned image is then registered to a known set of geographical objects. In this case, the geographical objects are the political boundaries of the United States. The function of registering the scanned image, which itself is a political boundaries map of the United States with a set of hand drawn AOIs, is performed using a Geographic Information System (GIS). Secondly, the registered scanned image is rectified so that the image retains its geographic relationship to real world coordinates. Finally, the contours of the rectified image are digitized.

The final set of AOIs is shown in Slides 136 to 143 of Appendix C. These represent the geocoded AOIs that are used to extract a list of counties whose emissions sources have the greatest potential to impact the air quality at a Class I area. Again, ARC/Info was used to extract the counties within each AOI. Figure 5-1 is an example geocoded AOI for the Boundary Waters and Voyageurs Class I areas. Note the distinction between the Level 1 and Level 2 AOIs for both sulfate-to-SO_2 and nitrate-to-NO_X sensitivities.

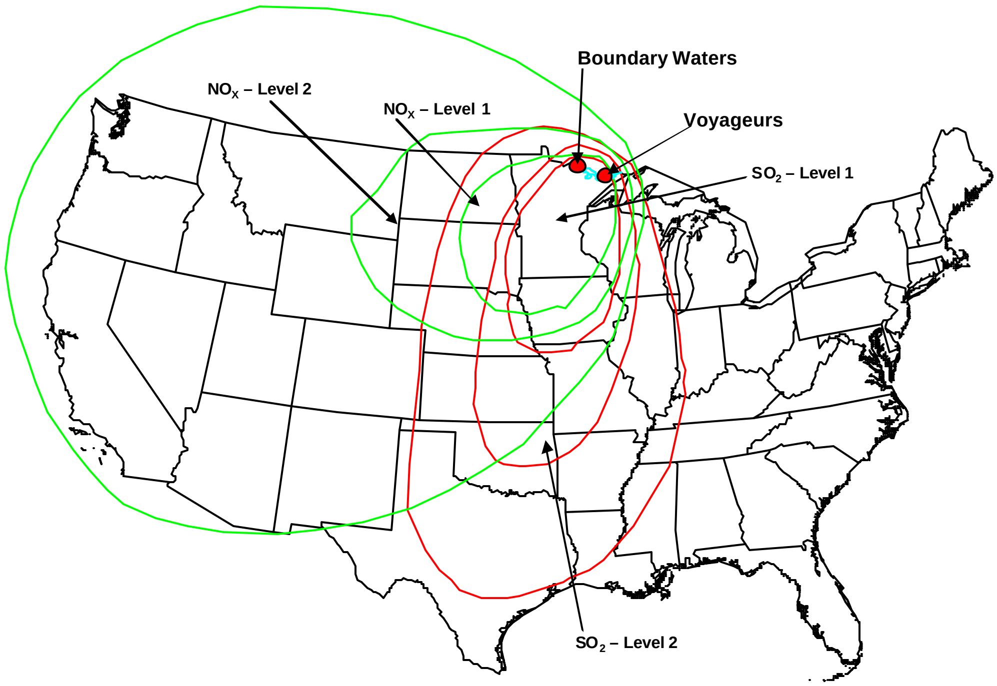

Figure 5-1. Example Geocoded AOI for Boundary Waters and Voyageurs Class I areas. Green contours delineate areas of influence where NO_X emissions impact aerosol nitrate at the Class I areas. Red contours delineate areas of influence where SO_2 emissions impact aerosol sulfate at Class I areas.

5.2 Development of Visibility Impairing Pollutant Concentrations to Precursor Emissions Sensitivity Coefficients

Though a list of counties can now be identified whose emissions sources have the greatest potential to impact air quality at a Class I area, this list has limited value until a quantitative value to associate emissions to air quality is estimated. Ideally, these associative values take the form of $\mu g/m^3$ of pollutant reduced per ton per day of precursor emissions reduced. For example, -0.001 $\mu g/m^3$ of sulfate per ton per day SO_2 reduced tells one that for each ton of SO_2 reduced within an AOI, the Class I area will exhibit a decrease of 0.001 $\mu g/m^3$ in sulfate concentration. This value is referred to as a sensitivity value and is very powerful at informing efforts such as those pursued in this study. A great deal of work has been performed to ascertain such sensitivities, and it is from this body of knowledge that sensitivities specific to the current efforts have been derived.

Tesche *et al.* (2003c) conducted a suite of brute force sensitivity runs using the CAMx and CMAQ air quality modeling (AQM) systems over the eastern United States on behalf of VISTAS. By systematically perturbing the global inventory (e.g., reducing global NO_X emissions by 10%) and rerunning the AQM, they developed a suite of metrics that provided the maximum reduction to say the peak, modeled ammonium nitrate. By converting the 10% NO_X reduction to actual tons per day NO_X reduction, which is simply done by taking 10% of the

emissions in the AQM-ready emissions files, and dividing that into the peak concentration reduction, the sensitivity that is of most importance is realized. Though this value is a more global sensitivity, its use is still valid for our needs. Indeed, by assuming that such a sensitivity is valid across the domain, this general purpose sensitivity value can be extended to all the AOIs of interest by computing the value of a 10% reduction in each of the AOIs and dividing this number into the general sensitivity value derived from the average of all the sensitivities, by pollutant of course, estimated by Tesche *et al.* (2003c).

Appendix D shows an Excel workbook containing the summary data (i.e., worksheet named "General") from Tesche *et al.* (2003c). The worksheet shows the results of the specific sensitivity analyses conducted, and the results of our efforts to compute a general purpose sensitivity value. Once a general purpose sensitivity value was computed, it was recast in a form specific to the Class I areas of interest. This was done by assuming that the general purpose sensitivity (e.g., $\mu g/m^3$ sulfate reduction per 10% reduction in SO_2 emissions) was valid across the domain and dividing this number by the tons per day value deduced from a 10% reduction of a precursor pollutant in the AOI of interest.

Though a general purpose sensitivity value was estimated for all Class I areas and AOIs of interest, other sensitivity information that was more specific to certain Class I areas was available from work done at the Georgia Institute of Technology (GIT, 2006). Researchers at GIT conducted numerous brute force sensitivity runs of the CMAQ AQM on behalf of VISTAS. One component of these efforts was to conduct specific emissions source region and emissions source category sensitivity experiments to determine light extinction sensitivities to a reduction in one ton of precursor emissions at Mingo Wilderness, Upper Buffalo, Caney Creek, Hercules Glade, Breton Island, Sipsey, and Mammoth Cave. The emissions source regions for the GIT efforts (GIT, 2006) included the individual VISTAS states, the clustered CENRAP states, and the clustered MANE-VU states. The GIT (2006) results were extracted and summaries were prepared for the combined Mingo Wilderness-Upper Buffalo-Caney Creek-Hercules Glade AOIs, the Breton Island AOI, the Sipsey AOI, and the Mammoth Cave AOI. The results of these efforts were summarized in Appendix D, Excel worksheet "Class I Specific."

Finally, the results of the sensitivity summary efforts were combined in order to prepare a consistent set of sensitivity values by AOI. This summary is presented in Appendix D, Excel worksheet "Summary" and in Table 5-1.

Table 5-1. Synthesis of Sensitivity Values for Each Class I Area by AOI level. Units should be interpreted as reduction in nitrate (sulfate) concentration ($\mu g/m^3$) per average daily ton reduction in NO_X (SO_2) emissions in the specified AOI Level (see Figure 4-5 for an example of the delineation of the AOI Level).

5.3 Estimated Emissions Reductions Necessary to Attain 2018 Glide Path

Now that the visibility 'increment' (Table 4-4 [proportional species reduction] and Table 4-5 [single specie reduction]) and the chemical species-to-precursor emissions sensitivity coefficients (Table 5-1) are known by Class I area, it is a simple matter to compute the annualized, incremental emissions reductions that are needed at each Class I area to attain the 2018 glide path. This is accomplished by dividing the visibility 'increment' by the sensitivity coefficient and multiplying by 365.

Table 5-2 shows the required incremental reductions of SO_2 and NO_X emissions that are estimated to be required in order for the Class I areas to meet the glide slope by 2018. The estimated SO_2 and NO_X reductions in Table 5-2 are proportional to chemical species contributions during the 20% worst haze days. In contrast, Table 5-3 shows the estimated SO_2 and NO_X emissions reductions if only one chemical species is reduced. The emissions reductions requirements in Tables 5-2 and 5-3 are reported to two significant figures.

For example, in order for Big Bend to meet the 2018 visibility glide path, approximately 73,000 tons per year of incremental SO_2 emissions reductions (Table 5-2) from SO_2 emissions source

residing in the Level 1 AOI (Figure 5-2) are required assuming that incremental emissions reductions are developed based on a proportional reduction in the chemical species. Hence, in addition to the estimated incremental SO_2 emissions reductions of 73,000 tons per year, estimated incremental NO_X emissions reductions of 8,000 tons per year are also expected to be required. Additionally, incremental emissions reductions in coarse material, soil, elemental carbon, and organic compounds are also necessary if, again, emissions reductions are based on proportional reductions in the chemical species, though these reductions were not estimated given that reasonably available emissions control scenarios exist only for NO_X and SO_2.

If only one chemical specie is controlled, for example sulfate, then precursor SO_2 incremental emissions reductions from emissions sources located within the SO_2 Level 1 AOI (Figure 5-2) are estimated to be 120,000 tons per year (Table 5-3). On the other hand, if only nitrate is controlled, precursor NO_X incremental emissions reductions from emissions sources located within the NO_X Level 1 AOI (Figure 5-2) are estimated to be 210,000 tons per year.

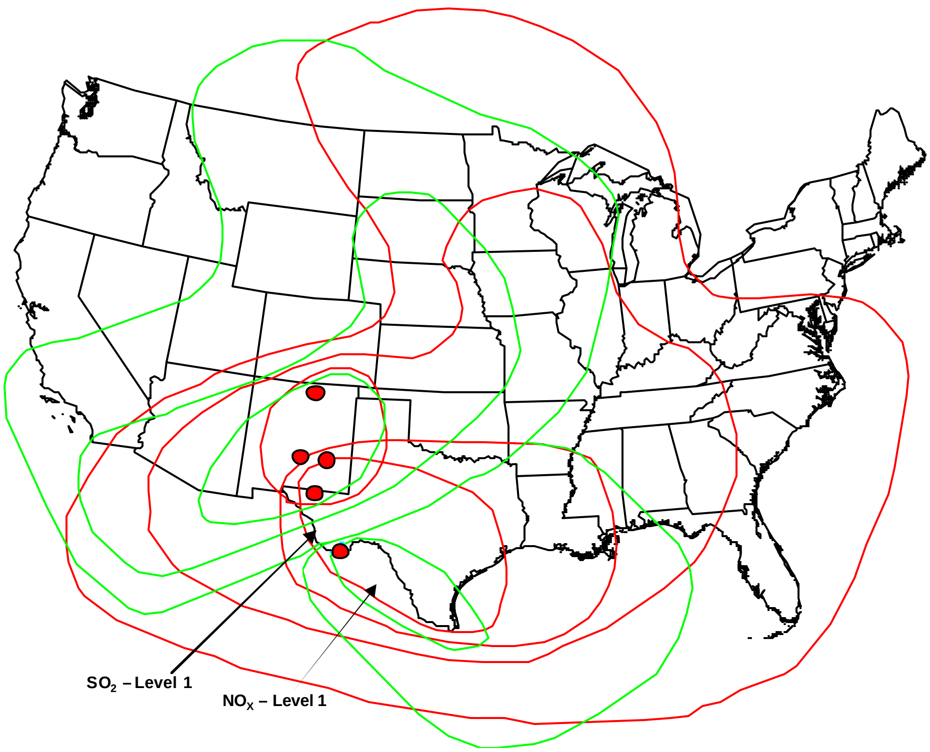

Figure 5-2. Geocoded AOIs for Big Bend, Guadalupe Mountain, Salt Creek, White Mountain, and Wheeler Peak. The Big Bend Level 1 AOI for SO_2 and NO_X are identified.

Table 5-2. SO_2 and NO_X Emissions Reduction Requirements (tons per year) Assuming Proportional Reductions in Sulfate and Nitrate.

6.0 PRIORITIZED CENRAP EMISSIONS REDUCTION SCENARIOS

6.1 Summary of Emission Inventories Used in Control Plan Development

A necessary component of the control strategy design is a thorough review of the emission inventories that are used in the modeling of the future year base case. This inventory can shed light on the residual emissions from sources or source categories defined to be within areas of transport or impact of a Class I area. We obtained and used the current CENRAP future year (2018) base case and 2002 base year emissions to conduct a review of the top emitting categories and pollutants within identified impact areas.

The SMOKE-ready modeling files for both 2002 and 2018 base year and base cases were obtained from CENRAP's emissions modeling contractor (UCR) in addition to a supplementary county level summary of onroad source emissions produced from the gridded, temporalized MOBILE6-based emissions output. Using the annualization methods confirmed with UCR and identified in the SMOKE file headers, each SMOKE input file was converted to annual emissions and summed for the geography and domain of interest.

Tables 6-1 and 6-2 present the major source category breakdown of these emissions for the entire CENRAP domain. AOI-specific breakdowns are presented in Appendix E of this document for those CENRAP Class I areas projected to be above the reasonable progress glide slope. Because the SMOKE-ready files were used in this analysis, the particulate matter transport factor is included in the PM emission summaries. This factor is applied to account for the removal of a substantial portion of fugitive dust emissions near a source by surrounding vegetation and structures when such emissions are used in regional scale modeling analyses.

As 2002 pre- and post-modeled emission summaries were provided on the input data files, we were able to verify the emission totals for each State and SCC in the modeling domain (Pechan, 2006). However, as 2018 summaries were not available in time to review the files for this analysis, we have not confirmed that these 2018 emission totals are as expected by the ICS.

Our review was conducted in a top down fashion starting with an analysis of the major source categories in the domains of interest to determine which major categories have the highest residual contribution to the area. Once the highest source types were identified, subcategories within those source types were reviewed. Again, a ranking of the highest residual sub source types was performed and additional analyses on these categories were conducted. Table 6-3 presents a percentage based contribution of residual emissions by major source category for the CENRAP domain. Tables for each CENRAP Class I AOI projected to be above the glide slope for reasonable progress are presented in Appendix E of this document.

In addition to reviewing the residual emission categories in the future year base, it was important to identify reductions that have already occurred within each category or at specific units. This will allow the ICS to determine if certain source categories that have yet to be controlled under the future year base case have the potential for reduction or if source types already reduced have reached the full cost-effective potential. Table 6-4 presents this information in annual tons for all sources in the CENRAP domain, while Table 6-5 presents the same information in terms of percent change from 2002.

Finally, once each subcategory was identified, unit level tables of emission comparisons from 2002 to 2018 were developed allowing the ICS to review existing emission reductions and providing the ability to assign new cost-effective controls to units using the best control for the scenario. These tables present comparisons of 2002 and 2018 emission levels, by pollutant, and future year control technology assignment (by IPM forecasting) for EGU sources. Since unit-

specific technology assignments were not identified in the SMOKE control packets nor in documentation obtained for use in this project, these units do not have associated future year technology identification data.

Ultimately, the ICS' final control strategy decisions will include the application of BART applicable source reductions in the future year base case. However, as these sources and their associated reductions were unavailable for this project, they too are not included in this analysis.

6.2 Process in Preparing Files for Control Plan Modeling

In addition to the SMOKE emission files, the 2018 growth and control packets were obtained from UCR for additional application and verification of future year scenario assignment. Since the CENRAP utilized version of the SMOKE processor does not replace control efficiency, rule effectiveness, and rule penetration values in the output files generated using the growth and control modules of the model, Alpine manually applied these values to the 2018 non-EGU and stationary area source files for which the packets were applied. This step was necessary to duplicate the inventories that went into the results of CENRAP's reasonable progress modeling and to ensure that any incremental assignment of control technologies did not duplicate emission reductions already assumed in the future year base case.

The 2018 IPM file used by CENRAP for EGU sources was also obtained and matched to the 2018 base case inventory of EGU sources. This step was conducted for reasons similar to those identified above for non-EGU and stationary area sources and to ensure that incremental controls assigned to these source types did not duplicate existing base case assumptions. Because IPM does not assign a control efficiency with each control device applied to SO_2 and NO_X, we made some assumptions, based on IPM documentation, as to what pollutant specific level of reduction was applied in the future year base case runs. These assumptions, by primary and secondary control device code combinations for SO_2 and NO_X, are presented in Tables 6-6 and 6-7, respectively.

Since many of the control technology control cost equations within AirControlNET require additional unit-level characteristic data, we also made matches of the SMOKE IDA files to CENRAP NIF, EPA NEI, or EPA CAMD CEM data sets to obtain these variables when missing.

Unit level boiler capacity (MMBtu/hr) or NETDC (MW) values are required for capital and operating and maintenance cost calculations for many of the EGU technologies. In cases where these nameplate capacity values could not be identified, emission weighted (based on the final EPA 2002 NEI) were assigned to boilers using a primary (highest emitting) SCC. Table 6-8 presents these weighted capacities. Additionally, stack flow, sulfur content, and primary SCC assignment were necessary to cross-reference available incremental control technologies to the base case emissions inventory data. These variables were obtained where matches could be found, in priority order of CENRAP, CAMD, and EPA datasets, respectively.

Table 6-6. IPM Post Processing Assigned Device Codes and Applied SO_2 Control Efficiencies.

6.3 Application of AirControlNET Technologies

AirControlNET is a control technology analysis tool developed to support the U.S. EPA in its analyses of air pollution policies and regulations (Pechan, 2005). The tool provides data on emission sources, potential pollution control measures and emission reductions, and the costs of implementing those controls.

The core of AirControlNET is a relational database system in which control technologies are linked to sources within EPA emissions inventories. The system contains a database of control measure applicability, efficiency, and cost information for reducing the emissions contributing to ambient concentrations of ozone, PM_{10}, $PM_{2.5}$, SO_2, NO_X, as well as visibility impairment (regional haze) from point, area, and mobile sources. PM_{10} and $PM_{2.5}$ as included in AirControlNET represent primary emissions of PM. The control measure data file in AirControlNET includes not only the technology's control efficiency, and calculated emission reductions for that source, but also estimates the costs (annual and capital) for application of the control measure.

Since the existing version of AirControlNET contains the preprocessed application of control technologies to a predetermined set of EPA emission inventories, direct use of the model in this analysis was not possible. However, Alpine received approval from EPA's Innovative Strategies and Economics Group (ISEG) to modify the AirControlNET version 4.1 source code and data tables in order to make it useful to this study (Sorrels, 2006). The results of the application of this modified version of the code still retain the applicability, efficiency, and cost information from the unmodified version of the source code, but were applied to the CENRAP modeling inventories with updated price index scalars to reflect control costs in 2005-dollars.

Using the modified inventories identified in Section 6.2 above, we ran every available control strategy in AirControlNET against the EGU, non-EGU point, and stationary area source inventories to develop a master list of available, *incremental* control strategies for the entire CENRAP 36 km domain necessary for the ICS to design command-and-control or cost-effectiveness based control strategies by source or domain. Mobile source controls were not processed under this assignment as it would have required multiple iterative runs of the EPA NONROAD and MOBILE6 models to generate the appropriate information. This master list of controls was used in the final development of the control strategy plan as described in the following sections.

Since AirControlNET's control cost equations take into consideration the useful remaining life of installed equipment and estimate the costs of compliance with these measures, two of the four reasonable progress goal considerations (see Section 6.6) are directly met through the results of the model's output.

6.4 Development of AOI-Based Cost Curves

Each Class I area in the CENRAP modeling domain has an associated set of AOIs as identified in other areas of this document. In order to best determine where emission reduction has the greatest benefit, this geography was designed to limit the available source type list from including all sources within the entire domain.

Using a geocoded county list from these AOIs, we parsed the master list of incremental control measures from all non-mobile source types and sources located within the boundaries of the AOIs. This parsed list was then sorted on in incremental cost-effectiveness (marginal cost) basis to determine the most cost effective control suite necessary to attain emission reduction targets for specific pollutants within each AOI. Each individual source or source category (unit or county-SCC combination) had its own cost effectiveness curve generated. In aggregate, the results of these applications are cost curves for each visibility impairing pollutant for all EGU, non-EGU point, and stationary area source within the geographic domain of the AOI. Incremental controls on mobile sources were not considered in this analysis. An illustrative example of the steps involved with the cost effectiveness curve design can be found in the Appendix F of this document. Figures 6-1, 6-2 and Appendix G present actual cost curves for AOI-1 areas associated with the six CENRAP Class I areas projected to be above the reasonable progress glide path.

6.5 Application of Cost Curves to Emission Reduction Needs

Two sets of cost curves have been developed for each pollutant-Class I AOI-1 combination identified as of interest to the ICS. The first marginal cost curve includes the application of all available control measures to all applicable source types within the AOI. The second curve is the result of limiting the control measure application to only the top three residual emission subcategories identified in the 2018 base case for each AOI-pollutant combination. These two curves will allow the ICS to determine if limiting the control scenario to only the highest residual categories will attain reasonable glide path emission reduction objectives while presumably minimizing the number and type of controlled sources in each AOI.

Within each AOI, an emissions reduction target has been established based on the review of relevant and available regional haze aerometric analyses and source attribution modeling. Each emissions reduction target sets the “solve point” of the cost curve and allows us to identify the most cost effective sources of reduction for the pollutants of interest within each impacted AOI.

It is noted that each pollutant-based cost curve developed for this analysis is mutually exclusive of each other pollutant’s cost curve and does not consider the feasibility of multiple control technologies being applied to any one source. Additionally, the information provided in these cost curves is representative of the primary pollutant of control and does not reflect any co-control applicability or disbenefit as a result of the application of that control.

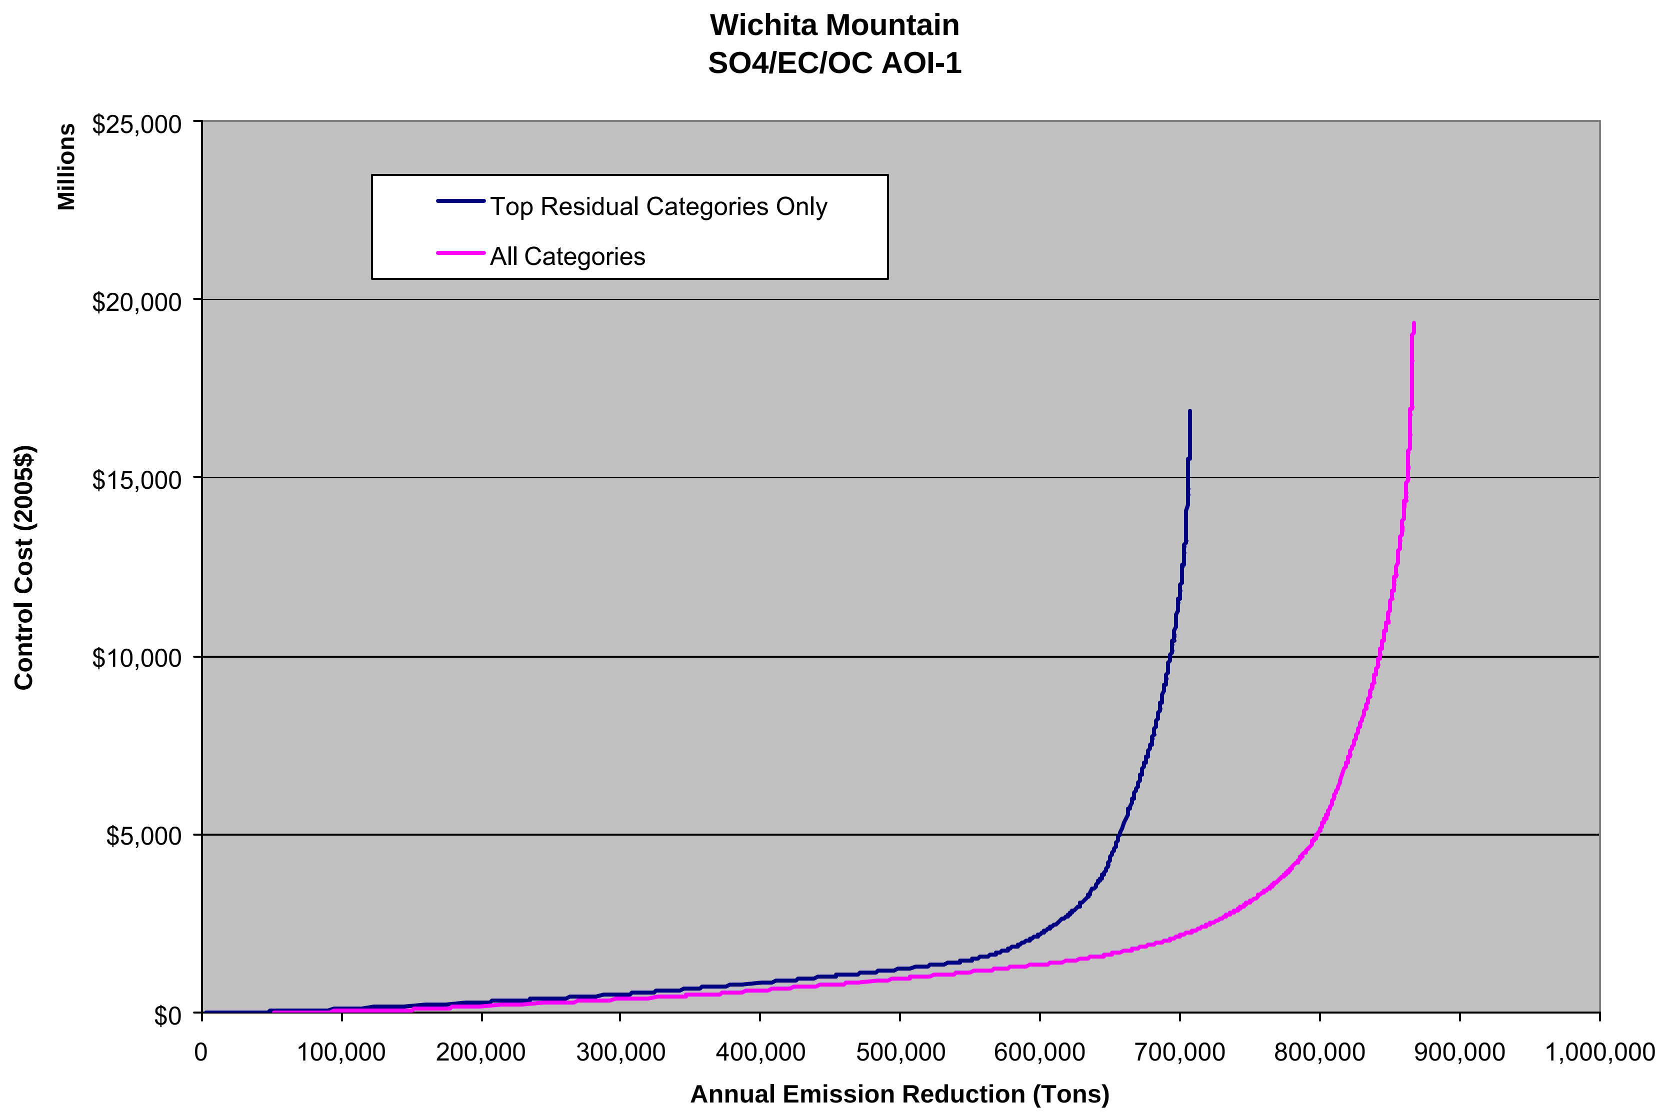

Figure 6-1. Marginal Cost Curve for Wichita Mountain SO4/EC/OC AOI-1.

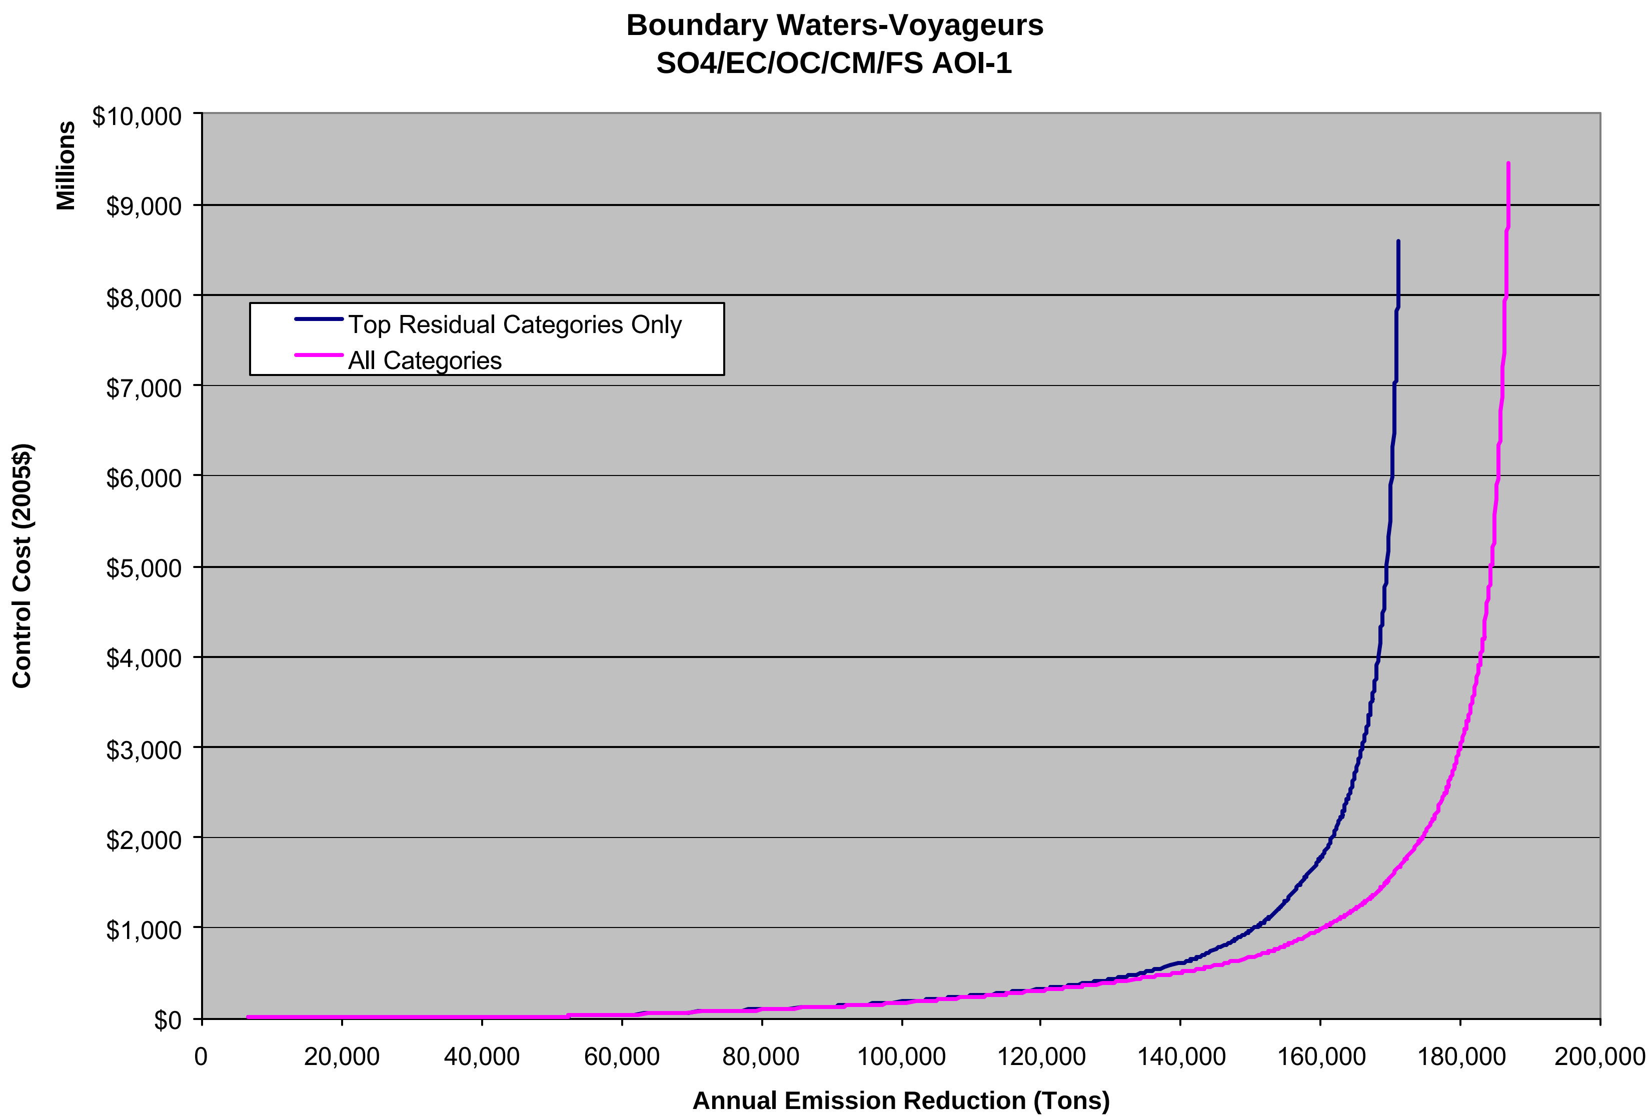

Figure 6-2. Marginal Cost Curve for Boundary Waters – Voyageurs SO4/EC/OC/CM/FS AOI-1.

6.6 Four Factor Analysis for RPG

As part of the regional haze program requirements outlined in 40 CFR 51.308, there are four factors which have been identified as mandatory for purposes of establishing a reasonable progress goal for any mandatory Class I area within a State.

40 CFR 51.308(d)(1)(i)(A) Consider the costs of compliance, the time necessary for compliance, the energy and non-air quality environmental impacts of compliance, and the remaining useful life of any potentially affected sources, and include a demonstration showing how these factors were taken into consideration in selecting the goal.

6.6.1 Cost of Compliance

The cost of compliance factor is used to determine whether compliance costs for sources are reasonable compared to the emission reductions and visibility improvement they will achieve. Costs should be determined for one-time capital costs and ongoing annual operation, maintenance, and upkeep costs.

Through the application of control technologies using the cost equations from the AirControlNET source code, we have identified individual units for control application, identified the design parameters for emission controls, and developed cost estimates based on those design parameters. An estimation of annualized cost of control, based on a one-time capital cost and continual operating and maintenance costs are included in this estimate, where parameters were available in the AirControlNET equations. This application of control cost analysis as applied to the incremental reduction sources defined in this study meets the application of the cost of compliance statutory factor.

6.6.2 Time Necessary for Compliance

The time necessary for compliance factor may be used to adjust the reasonable progress goals to reflect the degree of improvement achievable within the long term strategy period, as opposed to the improvement expected at full implementation of a control measure, if the time needed for full compliance exceeds the length of the long term strategy period. For example, if vendor availability within the period of the long term strategy could not meet the full requirements of the installation schedule outlined by the control strategy, the reasonable progress goals should reflect the visibility improvement anticipated from installation of controls at the percentage of sources that *could* be controlled within the strategy period.

In this particular analysis, a time necessary for compliance factor could not be determined simply based on the emissions inventory and a list of control measures applicable to controllable sources. An eventual SIP could include control strategies that extend beyond the 2018 milestone and the visibility improvement anticipated from installation of controls at the percentage of sources that *could not* be controlled within the first strategy period would have to be counted in a later SIP. Each of these elements would need to be determined on a unit by unit basis.

6.6.3 Energy and Non-Air Quality Environmental Impacts of Compliance

The energy and non-air impacts factor is meant to consider whether the energy requirements (the amount, type, and availability of energy) of the control technology result in energy penalties or benefits. For example, a particular control may require a fuel, water may be required for a cooling tower, or a landfill may be required for disposal of solid waste byproduct, each which are directly unavailable in the area. Since these impacts are State and site specific, they are not addressed in this analysis. Upon the final configuration of the control strategies by the ICS, each participating State, tribe and affected entity should review the control plan to determine whether significant energy burdens or benefits comes as a direct result of the application of a control technology. If determined to be so, the State should quantify this value and include it in the final submitted SIP.

6.6.4 Remaining Useful Life of Potentially Affected Sources

The statutory factor of the remaining useful life of the source is applicable only to those measures which would require retrofitting of control devices at *existing* sources. The remaining useful life of a source affects the annualized costs of retrofit controls and is included in the methods used for calculating annualized costs in the control cost equations modified from EPA's AirControlNET.

CENRAP's emission projections, as well as the control cost equations applied by Alpine, account for the remaining useful life between the year of the reasonable progress analysis and the date the facility permanently stops operations. Since source specific retirements are taken into consideration with the CENRAP forecasts (units are shut down in the year of their retirement) and average retirement rates are applied to control technologies within the control analysis equations, the statutory factor of the remaining useful life of the source has been considered.

In summary, the basis of our resulting control strategy recommendations provide a demonstration of those reasonable progress goal requirements which could be taken into consideration to meet visibility objectives with the data provided for this analysis. The remaining factors are State, tribal and site dependant and could not be addressed here.

7.0 SUMMARY AND RECOMMENDATIONS

7.1 Summary

Alpine's review of all data discussed in the previous sections of this document have identified six Class I areas (Big Bend National Park, Breton Island, Boundary Waters, Guadalupe Mountains, Wichita Mountain, and Voyageurs) within the CENRAP domain, their particular AOIs, ICS defined emission reduction targets, and potential incremental emission reductions recommended for CENRAP modeling. For each area, sulfate and to a lesser extent, nitrate reductions were shown to be most beneficial during the 20 percent worst visibility days in 2002.

Alpine has configured subregional control strategies based on direction provided by the ICS to use single precursor emission reduction assumptions with a marginal cost per ton cutoff of $5,000 per ton reduced. Emission targets were identified by the ICS for each Class I area AOI to exceed the reasonable progress glide slope. These targets were established as 25 percent more reduction than was identified in Table 5-3 and were to be taken from any available source, not just those identified as having the highest residual emissions contribution to the Class I area AOI. Table 7-1 presents a summary of each of these strategies.

Table 7-1. Subregional control strategy summary for single precursor emission reduction targets.

		SO2 Annual Emission Reduction (Tons)			Control Strategy
Class I Area	ST	ICS Established Reduction Target	Subregional Control Strategy Reductions	Control Strategy Total Cost ($2005)	Average Cost Per Ton ($/ton reduced)
Breton Island	LA	385,000	119,966	$203,443,093	$1,696
Boundary Waters	MN	40,000	46,301	$107,233,124	$2,316
Voyageurs	MN	28,750			
Wichita Mountains	OK	93,750	99,479	$21,752,713	$219
Guadalupe Mountains	TX	162,500	115,936	$319,001,184	$2,752
Big Bend Nat'l Park	TX	150,000			

For three of the six CENRAP Class I areas projected to be above the reasonable progress glide slope in 2018, control strategies have been prepared which meet the emission reduction targets recommended by the ICS. These areas (Boundary Waters, Wichita Mountains, and Voyageurs) all can meet the ICS defined targets while staying within the single precursor, $5,000 per ton reduced limitations.

We also have determined that as a result of the implementation of the list of additional point and area source controls in each primary AOI the remaining three Class I areas within the CENRAP domain (Big Bend National Park, Breton Island, and Guadalupe Mountains) modeled to be above the reasonable progress glide slope will be unable to achieve a level of emissions reduction necessary to bring these areas under the glide slope by 2018 using the ICS identified control strategy definitions. Influences such as incrementally uncontrollable source categories, marginal cost effectiveness values greater than $5,000 per ton reduced, and international and inter-RPO emission transport prevent strategies from being configured for these Class I areas.

In particular, recent BRAVO research (see, for example Barna et al. 2006) shows that Mexican SO_2 sources account for up to 23% of the observed annual sulfate levels at Big Bend. During the summer months, Mexican SO_2 emissions sources can account for as much as 70% of the sulfate at Big Bend. Barna et al. also show that SO_2 emission sources for the Eastern U.S. are the biggest culprit to high sulfate at Big Bend during the high $PM_{2.5}$ summer days; and SO_2 from the Eastern US and Texas are the biggest contributor to high sulfate at Big Bend during the high $PM_{2.5}$ fall days.

In both of these episode examples, regardless of the emissions reduction achieved by CENRAP with the available source category and technology applications, there still is an emissions component which is directly out of their control. Additional consultation with inter-RPO and international agencies may be required to adequately co-configure strategies to bring these areas into attainment.

7.2 Recommendations

7.2.1 Regional Controls

As each of the six Class I areas projected to be above the reasonable progress glide path (and all of the other Class I AOIs in the CENRAP domain) are dominated by EGU SO_2 and NO_X emissions and many of these area AOIs intersect with States currently excluded by the EPA CAIR rule, *we recommend that CENRAP consider a control scenario which would reduce EGU emissions in non-CAIR States to levels comparable to those promulgated by EPA in the final CAIR regulation.* In addition to this regional strategy proposal, *we further recommend that the ICS consider individual CENRAP States within Class I area AOIs projected above the reasonable progress glide slope to meet CAIR emissions budgets without the interstate trading aspect of the rule*. This nuance may prevent emission reductions from being transferred to areas outside of the influential zones of the affected Class I areas and focus the reductions in those upwind areas with greatest impact on meeting visibility objective goals.

These regional controls could be modeled in multiple ways. Two noted methods being to develop an additional IPM run configured to take into account the CAIR reductions within non-CAIR States with or without the constraint of trading noted above. The second method would be to determine an emission budget (following EPA methods in the CAIR final rule) to determine State level targets for emission reduction. Using these targets, CENRAP could then apply the marginal cost curves developed for this analysis, but limit the solution to only EGU sources identified as "CAIR eligible". This approach would not take into account any trading or participation in the bank and trade system, but would give an estimate of the regional emission reductions associated with the strategy.

7.2.2 Subregional Controls

In lieu of a single regional control option applied consistently across the entire CENRAP domain, individual subregional controls could be applied to reduce emissions within certain Class I area AOIs. Based on the single precursor emission reduction target calculations defined elsewhere in this document, subregional control strategies can be defined for three of the Class I areas projected to be above the reasonable progress glide path. In each case, the marginal cost

curves (based on the application of all available control options on all controllable industries and source types) allow the selection of control technologies for sources within an AOI-1 that attains the ICS defined emission reduction targets. Details of these control strategies are presented in Tables 7-2 and 7-3. Note that as Boundary Waters and Voyageurs are associated within the same AOI-1, the larger of the two emission reduction targets was used to configure a control strategy that would meet both areas' needs.

However, as noted in this document, the application of incremental control on all controllable point and area sources within the AOIs still fails to meet the visibility objectives of three Class I areas modeled to be above the reasonable progress glide slope. For this reason, *we additionally recommend that the ICS consider applying the remaining reasonably cost effective control technologies to sources within States and tribal lands contained in the boundaries of the three target Class I area AOIs.* As part of the demonstration of reasonable progress, the application of reasonably cost effective controls to all emission sources and source types through a process as described in this document appears to provide support that the four reasonable progress goal considerations were taken into account where available. As is demonstrated for the Boundary Waters and Voyageurs AOI-1 above, the AOI-1 for Big Bend and Guadalupe Mountains share the same emission reduction target. In this case, however, the target cannot be fully achieved. Tables 7-4 and 7-5 present the details of these strategies.

For those Class I areas outside of CENRAP's domain who based on CENRAP modeling did not forecast below the reasonable progress glide slope, we submit to the ICS our data of incremental control strategy application and cost curves based on existing modeling and inventory assumptions provided by CENRAP to date for purposes of consultation with those States in which the affected Class I areas are located. We have not presented these non-CENRAP data as part of this document but much of the basic information is presented, where appropriate, in the supporting appendixes.

Missouri Smoke Management Plan

Missouri
Department of
Natural Resources

Smoke Management Plan

December 2007

TABLE OF CONTENTS

1.0 Introduction

Natural resource management's objective is to create, maintain and restore ecosystems. Many tools are available to managers to accomplish these objectives. One of the more important tools is prescribed fire (controlled open burning). The unhealthy ecosystems that exist today are often a result of past management strategies. The undesired effect of controlling natural fires in an attempt to save trees and property results in some tree and shrub species becoming established that would normally be eliminated by such fires. Other consequences are that insect infestations may go unchecked for many years and dangerous levels of combustible material can build up. Prescribed fires can correct these situations.

Prescribed fires are conducted within the limits of a fire plan and prescription that describes both the acceptable range of weather, moisture, fuel, and fire behavior parameters, and the ignition method to achieve the desired effects. Prescribed fire is a cost-effective and ecologically sound tool for forest, range, and wetland management. Its use reduces the potential for destructive wildfires and thus maintains long-term air quality. Also, the practice removes logging residues, controls insects and disease, improves wildlife habitat and forage production, increases water yield, maintains natural succession of plant communities, and reduces the need for pesticides and herbicides.[1]

There is a reemphasis on public land management and ecosystem restoration. Land managers are actively managing areas in an attempt to make them healthy. Prescribed fires are proactive tools that simulate the natural fires that might occur in an area due to such events as lightning. This management attempts to mimic the frequency, size, and severity of fires that might occur in an area through natural causes.

In 1995, a Federal Wildland Fire Management Policy and Program Review was conducted in response to the unhealthy condition of our public wildlands, and the

---

[1] EPA's National Agriculture Compliance Assistance Center – www.epa.gov/agriculture/tburn.html

increase in unplanned fires that occurred in 1987, 1988, 1992 and again in 1994. As a result of this review, the five principal Federal fire/land management agencies [the Forest Service (FS) under the Department of Agriculture; and the Bureau of Land Management (BLM), National Park Service (NPS), Fish and Wildlife Service (FWS), and the Bureau of Indian Affairs (BIA) under the Department of the Interior] agreed on need for several changes to existing fire/land management practices. Their recommendations include the reintroduction of fire (allowing it to play its natural role) into Federal land management programs in "an ongoing and systematic manner, consistent with public health and environmental quality considerations." The goals of this change in land management policy are to reduce unnatural fuel densities that contribute to increasing unplanned fire hazards, and to restore wildland ecosystems to their healthy natural states. The Federal agencies previously mentioned began increasing the use of fire in their most vulnerable wildlands in 1997. Annual treatment targets for all Federal land management agencies will be increased to more than 5 million acres per year by 2005.[2]

Wildland and prescribed fires had about equal acres burned in Missouri in 2006. As reported to the National Interagency Coordination Center, there was over 24,000 acres burned by wildland fires and over 21,000 acres burned by prescribed fires. On a national scale, Missouri was 28th in acres burned through wildland and prescribed fires in 2006. By comparison, in year 2000 over 13,000 acres were burned by wildland fires and over 8,000 acres by prescribed fires.[3]

The increased use of fire to restore ecosystems is a positive for the ecosystem, but is a concern for air quality. The smoke that can result from prescribed fires can have adverse effects on human health and welfare. Difficult and painful breathing, aggravated asthma, and respiratory illness are all linked to elevated particulate matter in the air. Approximately eighty to ninety percent (80-90%) of wildfire smoke (by mass) is within the fine particulate size class ($PM_{2.5}$). This high percentage of fine particulate size highlights the concern about smoke.

---

[2] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)
[3] www.nifc.gov/stats/ytd_st.htm

The major air pollutant of concern is the smoke produced. Smoke from prescribed fires is a complex mixture of carbon, tars, liquids, and different gases. This open combustion source produces particles of widely ranging size, depending to some extent on the rate of energy release of the fire. The major pollutants from wildland burning are particulate, carbon monoxide, and volatile organics. Nitrogen oxides are emitted at rates of from 1 to 4 grams/kilogram burned, depending on combustion temperatures. Emissions of sulfur oxides are negligible.[4]

Minimizing the adverse effects of smoke results from a concerted effort to utilize prescribed fires in a beneficial manner consistent with proven management strategies. These strategies include understanding and using meteorological conditions when scheduling burning to avoid sending smoke into a sensitive area, controlling the rate of emissions to promote dilution and dispersion, and minimizing smoke output per unit area through emissions reduction techniques.

In addition to minimizing the adverse effects that smoke can have on human health and welfare, smoke management is becoming increasingly important to meet federal and state air quality regulations. National Ambient Air Quality Standards (NAAQS) for particulate matter are a concern, especially for fine particulates. Fine particulates are those most closely associated with negative human health effects and with visibility reductions in the form of regional haze. In 1999, the U.S. EPA issued regional haze regulations to manage and mitigate visibility impairment from regional haze sources. The regional haze regulations call for states to establish goals for improving the visibility at Class I national parks and wildernesses. Missouri has two (2) Class I areas in the state, Mingo Wilderness Area and Hercules Glade Wilderness Area. See Appendix 4.1 for their location within the state. Fire, while not considered to be a main source of visibility impairment in any Class I area, is one source of regional haze.

[4] EPA's National Agriculture Compliance Assistance Center – www.epa.gov/agriculture/tburn.html

Both regulators and land managers recognize the importance of fires and the resulting smoke. Regulators understand the important tool that fire provides to land managers in managing ecosystems. Land managers understand the importance of minimizing smoke production in meeting federal and state air quality standards. Smoke management is an increasingly important component of an air program that aims to protect human health and welfare and meet air quality standards while still providing for necessary prescribed fires.

2.0 Background

The purpose of the Missouri Smoke Management Plan (SMP) is to identify the responsibilities of the Missouri Department of Natural Resources, federal land managers, and state land managers to coordinate procedures that mitigate the impacts of prescribed fire and wildland fire used for resource benefits on public health, safety and visibility. This plan is designed to meet the policies of the U.S. Environmental Protection Agency's (EPA) Interim Air Quality Policy on Wildland and Prescribed Fires (April 1998). A complete copy of the policy can be found in the Appendix.

The EPA will allow States/tribes flexibility in their approach to regulating fires managed for resource benefits. They are not required to change their existing fire regulations if those regulations adequately protect air quality. However, there are incentives for States/tribes to certify to EPA that they have adopted and are implementing a SMP that includes the basic components identified in this policy. The main incentive is that, as long as fires do not cause or significantly contribute to daily or annual $PM_{2.5}$ and PM_{10} NAAQS violations, States/tribes may allow participation by burners in the basic SMP to be voluntary and the SMP does not have to be adopted into the State Implementation Plan (SIP). Another incentive is the commitment by EPA to use its discretion not to redesignate an area as nonattainment when fires cause or significantly contribute to PM NAAQS violations, if the State/tribe required those fires to be conducted within a basic SMP. Rather, if fires

cause or significantly contribute to violations, States/tribes will be required to review the adequacy of the SMP, in cooperation with wildland owners/managers, and make appropriate improvements.[5]

Consistent with these policies, the department's Air Pollution Control Program has contacted the various federal and state land managers that work within Missouri to develop this SMP. Federal land managers are subject to laws and requirements through federal planning mandates. This includes the preparation of short and long-term plans and the evaluation of environmental impacts. The Appendix contains a copy of the Interagency Prescribed Fire Planning and Implementation Procedures Reference Guide that standardizes procedures specifically associated with the planning and implementation of prescribed fires on a federal level. The United States Department of Agriculture (USDA) Forest Service has the National Forest Management Act, the U.S. Department of the Interior has the Integrated Resource Management Plan, the National Park Service has the Resource Management Plan and the Fish and Wildlife Service has the Comprehensive Conservation Plan. State land managers also have requirements similar to those of federal land managers for preparing burn plans.

3.0 Smoke Management Plan

States/tribes will be allowed the flexibility (prior to measuring violations of the PM or $PM_{2.5}$ NAAQS attributable to fires managed for resource benefits) to decide when a SMP is needed and how the program will be designed to prevent adverse air quality impacts. This does not preclude wildland owners/managers from including smoke management components in burn plans for fires that they conduct in the absence of an applicable State/tribal program.[6]

[5] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)
[6] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)

The SMP establishes a basic framework of procedures and requirements for managing smoke from fires managed for resource benefits and are typically developed by States/tribes with cooperation and participation by wildland owners/managers. The purpose of a SMP is to mitigate the nuisance and public safety hazards (e.g., on roadways and at airports) posed by smoke intrusions into populated areas; to prevent deterioration of air quality and NAAQS violations; and to address visibility impacts in mandatory Class I Federal areas. Some strong indications that an area needs a SMP are: (1) citizens increasingly complain of smoke intrusions; (2) the trend of monitored air quality values is increasing (approaching the daily or annual NAAQS for $PM_{2.5}$ or PM_{10}) because of significant contributions from fires managed for resource benefits; (3) fires cause or significantly contribute to monitored air quality that is already greater than 85 percent of the daily or annual NAAQS for $PM_{2.5}$ or PM_{10}; or (4) fires in the area significantly contribute to visibility impairment in mandatory Class I Federal areas.[7]

None of the four indicators listed above currently shows a problem in Missouri.

State/tribal air quality managers, public wildland managers, private and Indian wildland owners/managers, and the general public should collaborate in the development and implementation of a State/tribal SMP. The State/tribal air quality manager must certify in a letter to the Administrator of EPA that at least a basic program has been adopted and implemented in order to receive special consideration under this policy of air quality data resulting from fire impacts, as explained in section VII of EPA's interim air quality policy. The SMP does not have to be incorporated into the SIP/Tribal Implementation Plan (TIP) or be Federally enforceable, however. The following describes the basic components of a certifiable SMP. There is considerable latitude within the components for individual State/tribal preferences.[8]

[7] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)
[8] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)

Basic components of a smoke management program identified in the Interim Policy include:

- Authorization to Burn
- Minimizing Air Pollutant Emissions
- Smoke Management Components of Burn Plans
    - *Actions to Minimize Fire Emissions*
    - *Air Quality Monitoring*
    - *Evaluate Smoke Dispersion*
    - *Public Notification and Exposure Reduction Procedures*
- Public education and awareness
- Surveillance and Enforcement
- Program evaluation

These components outlined in the Interim Policy are present in the federal and state land managers burn plans for Missouri. Land managers have detailed planning and implementation procedures for their prescribed fires. As an example, Appendix 4.4 contains the Interagency Prescribed Fire Planning and Implementation Procedures Reference Guide for federal land managers. This guide provides consistent interagency policy for what is minimally acceptable for prescribed fire planning and implementations. Within this guide, procedures for fire projects are outlined in great detail. These projects are analyzed under the National Environmental Policy Act.[9]

The Missouri Air Conservation Commission has authority under statute 643.050 to promulgate regulations to preserve and protect the state's air resources. At this time, the department intends to allow federal and state land managers to maintain authority to prepare and implement burn plans and to voluntarily notify us of their fire plans. These federal and state land managers will maintain their present protocol for preparing fire plans and seeking authorization to implement fire plans. The department will maintain this voluntary smoke management plan since these prescribed fires have not resulted in air quality problems and will coordinate, to the extent possible, the prescribed burns in

the state. If these prescribed fires cause or significantly contribute to violations, the department's Air Pollution Control Program will review the adequacy of the SMP, in cooperation with wildland owners/managers, and make appropriate improvements. Copies and examples of federal and state land manager burns plans can be found in the Appendix.

3.1 Authorization to Burn

The EPA does not directly regulate the use of fire within a State or on Indian lands. The EPA's authority is to enforce the requirements of the CAA. The CAA requires States and tribes to attain and maintain the NAAQS adopted to protect public health and welfare. This policy recommends that States/tribes implement SMP's to mitigate the public health and welfare impacts of fires managed for resource benefits. While SMP's will also mitigate nuisance smoke intrusions, nuisance issues have been left for the individual air quality agencies to address.[10]

If a State/tribe determines that a SMP is needed, they can adopt any type of program they believe will prevent NAAQS violations and address visibility impairment. For example, general fire regulations may establish basic parameters, such as wind speed, direction, location and distance to sensitive receptors, etc., within which fires can be ignited or naturally ignited fire can be allowed to continue to burn. States/tribes may allow wildland owners/managers to voluntarily notify them of fire plans or may require prior authorization. They may also exempt de minimis fires (fires that will cover fewer than X acres or consume less than Y tons of fuel, as established by the State/tribe) from meeting the regulations. Such regulations leave much discretion to wildland owners/managers as to when to ignite fires, and what management strategy to follow with naturally ignited fires. States/tribes may exercise enforcement authorities when wildland owners/managers are found to have ignited the fire outside of the parameters of the rule,

---

[9] Interagency Prescribed Fire Planning and Implementation Procedures Reference Guide (September 2006)
[10] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)

or not to have appropriately responded to air quality impacts caused by naturally ignited fires. General fire regulations may be adequate for areas where fires managed for resource benefits rarely cause or contribute to air quality problems. However, when plans to use fire on a large scale could cause significant air quality impacts, or several wildland owners/managers within an airshed are expected to use fires concurrently, a more structured SMP requiring cooperation and coordination of fire activities may be required to minimize emissions and mitigate the air quality impacts.[11]

Federal and state land manager burn plans contain multiple reviews and approvals prior to authorization. These reviews include procedural and technical reviews of the plan. In addition, individual burns are subject to burn/no-burn decisions prior to initiating a burn.

The state's open burning regulations provide exemptions for open burning associated with agricultural activities related to the growing and harvesting of crops and for open burning for natural resource management purposes. There is language within the regulations that makes it a violation to permit open burning which causes or constitutes a public health hazard, nuisance, or a hazard to vehicular or air traffic. This allows the director a great deal of authority to prevent or stop burning that is occurring.

The department's Air Pollution Control Program is in the process of replacing the state's four (4) existing open burning regulations with a new rule. The new rule consolidates the existing rule requirements and is written to improve rule compliance and enforcement.

3.2 Minimizing Air Pollutant Emissions

When the use of fire is selected as the best means to accomplish management goals, there are several ways to reduce emissions from a single fire. The approaches fall into four categories and their applicability varies by fuel type, (1) minimize the area burned, (2)

---

[11] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)

reduce the fuel loading in the area to be burned, (3) reduce the amount of fuel consumed by the fire, (4) minimize emissions per ton of fuel consumed. These emission reduction techniques rely almost exclusively on reducing the amount of fuel consumed by a particular fire.[12]

Basic smoke management practices could include, among other practices, steps that will minimize air pollutant emissions during and after the burn, evaluate dispersion conditions to minimize exposure of sensitive populations, actions to notify populations and authorities at sensitive receptors and contingency actions during the fire to reduce exposure of people at such receptors, identify steps taken to monitor the effects of the fire on air quality, and identify procedures to ensure that burners are using basic smoke management practices.

3.3 Smoke Management Components of Burn Plans

Actions to Minimize Fire Emissions

The burn plan should show the steps taken by the respective entity prior to, during, and after the burn to reduce air emissions. This could include such activities as reducing the burn acreage, using non-fire alternatives, and rapid and complete mop-ups in an area.

Air Quality Monitoring

The burn plan should identify how the burn may affect air quality in sensitive areas near the prescribed burn and how this will be monitored. Personnel should at a minimum visually monitor the progress of the burn and evaluate the burns potential to interfere with the people and property in the vicinity. This would include mechanisms to alert the public should the burn present a problem. For burns expected to take more than a day, other monitoring techniques that might include PM monitors may be necessary to determine concentrations near sensitive areas.

[12] EPA's Interim Air Quality Policy on Wildland and Prescribed Fires (U.S. EPA 1998)

Evaluate Smoke Dispersion

The burn plan should identify the anticipated dispersion of the smoke from the burn site prior to the event. Effort should be made to minimize the exposure of sensitive populations to smoke and to avoid impacting the visibility in Class I Federal areas. This would also include efforts to minimize the impact of smoke along highways and airways. The distance and directions to sensitive areas should be evaluated and checked against atmospheric conditions. Wind speed, wind direction, mixing heights, and other dispersion conditions should have minimum requirements that need to be met prior to authorizing a burn.

Public Notification and Exposure Reduction Procedures

The burn plan should identify actions that will be taken prior to initiating a burn to make local authorities aware of actions being taken in their area. This would also include contingency actions to be taken should a burn go beyond its predicted dispersion area and impact sensitive populations and areas.

3.4 Public Education and Awareness

The department's Air Pollution Control Program will be coordinating the promulgation of new rule 10 CSR 10-6.045 Open Burning Requirements with an educational effort to improve the rules visibility within the state. Pamphlets explaining the new rule and the harmful effects of smoke will be produced and made available to the regional offices, other state agencies, and to other interested organizations to distribute. The department's Air Pollution Control Program will focus on groups that could potentially have a significant impact on air monitoring through open burning, such as farmers that burn crop stubble or land managers that utilize prescribed burns.

3.5 Surveillance and Enforcement

Missouri has five (5) regional offices covering all areas of the state. In addition, satellite offices are located in several of the regions. Staff in these offices are involved in monitoring compliance with state regulations and in enforcing those regulations.

3.6 Program Evaluation

The department’s Air Pollution Control Program monitors the state’s air resources through a network of air monitoring sites located throughout the state. A map of the statewide network is found in the appendix.

The Missouri Department of Natural Resources and Local Agencies in St. Louis City, St. Louis County, and Springfield operate approximately 201 ambient air quality monitoring instruments at 44 locations in the state. The intent of this network is to determine the nature of the air quality in the state, and determine the location and severity of any problems. Monitors evaluate pollutant levels related to the National Ambient Air Quality Standards, which are health and welfare based standards developed by the U.S. Environmental Protection Agency. Trends from these monitoring sites indicate changes in air quality over time, and provide information on air quality relationships in various parts of the state. In addition, monitoring for various air toxics is conducted, as well as monitoring to understand the chemical makeup of some air pollutants, to help evaluate pollutant sources and controls.

Background on the Role of Fire

What Wildland Fire Conditions Minimize Emissions and Hazardous Air Pollutants and Can Land Management Goals Still Be Met?

Air Monitoring for Wildland Fire Operations

Emissions Inventories for SIP Development

Estimating Natural Emissions From Wildland and Prescribed Fire

I. PURPOSE

This policy statement has been prepared in response to plans by some Federal, tribal and State wildland owners/managers to significantly increase the use of wildland and prescribed fires to achieve resource benefits in the wildlands.[1] Many wildland ecosystems are considered to be unhealthy as a result of past management strategies. The absence of fire effects has allowed plant species (e.g., trees and shrubs) that would normally be eliminated by fires to proliferate, vegetation to become dense and insect infestations to go unchecked. Wildland owners/managers plan to significantly increase their use of fires to correct these unhealthy conditions and to reduce the risk of wildfires to public and fire fighter safety. The largest increases are expected mainly on Federal lands in western States in ecosystems where fires would naturally occur every few years (35 years or less) if not suppressed. Fire has continued to be a management tool used by many public and private wildland owners/managers in the southeastern States. However, Federal land managers in the southeast also plan to significantly increase their use of fire above current annual levels.

This policy statement integrates two public policy goals, (1) to allow fire to function, as nearly as possible, in its natural role in maintaining healthy wildland ecosystems, and (2) to protect public health and welfare by mitigating the impacts of air pollutant emissions on air quality and visibility. This document provides guidance on mitigating air pollution impacts caused by fires in the wildlands and the wildland/urban interface. It identifies the responsibilities of wildland owners/managers and State/tribal air quality managers to work together to coordinate fire activities, minimize air pollutant emissions, manage smoke from wildland and prescribed fires managed for resource benefits, and establish emergency action programs to mitigate the unavoidable impacts on the public. This policy is not intended to limit opportunities by private wildland owners/ managers to use fire so that burning can be increased on publicly owned wildlands. Thoughtful use of fire by private, public and Indian wildland owners/managers within SMP's is promoted to maintain healthy wildland ecosystems. Neither is this policy intended to

[1]This document contains EPA policy and, therefore, does not establish or affect legal rights or obligations. It does not establish a binding norm and it is not finally determinative of the issues addressed. In applying this policy in any particular case, the EPA will consider its applicability to the specific facts of that case, the underlying validity of the interpretations set forth in this memorandum, and any other relevant considerations, including any that may be required under applicable law and regulations.

imply that States/tribes should relax existing SMP's or limit a State's/tribe's ability to regulate fires managed for resource benefits.

The EPA used a deliberative process involving a multi-stakeholder workgroup to develop recommendations for this policy. The workgroup did not reach consensus on all of the issues raised. The EPA addressed all of the recommendations and concerns raised by the stakeholders to the extent possible. The multi-stakeholder workgroup also produced several "white papers" on a number of topics previously identified in earlier drafts of the policy as Appendices to the policy. These papers will be published as a separate document and can also be found on EPA's TTN2000 website:
http://134.67.104.12/html/o3pmrh/pbissu.htm, and on the Western States Air Resources Council (WESTAR) website: http://www.westar.org/proj_frame.html. A list of these papers is provided in the Table of Contents.

II. SCOPE AND APPLICABILITY

The EPA does not directly regulate the use of fire within a State or on Indian lands. The EPA's authority is to enforce the requirements of the CAA. The CAA requires States and tribes to attain and maintain the NAAQS adopted to protect public health and welfare. This policy recommends that States/tribes implement SMP's to mitigate the public health and welfare impacts of fires managed for resource benefits. While SMP's will also mitigate nuisance smoke intrusions, nuisance issues have been left for the individual air quality agencies to address.

This policy applies to all wildland and prescribed fires managed to achieve resource benefits on public, Indian and privately owned wildlands, regardless of the cause of ignition (e.g., lightning, arson, accidental, land management decision, etc.) or purpose of the fire (e.g., natural, resource management, hazard reduction, etc.).

Federal land management agencies sometimes manage naturally ignited fires to achieve resource benefits. Planning for naturally ignited fires is obviously limited, but the agencies require fire management plans to be included in land use plans for an area before a naturally ignited fire can be managed for resource benefits. Fires ignited in areas without fire management plans are

unwanted or wildfires. The interface between this policy and the Natural Events Policy[2] regarding ambient PM_{10} concentrations caused by wildfires is addressed in section VII.

This policy does not apply to other open burning activities, such as burning at residential, commercial or industrial sites; open burning of land clearing waste or construction debris. It also does not apply to open burning of agricultural waste, crop residue or land in the USDA Conservation Reserve Program. The EPA is working with the USDA Agriculture Air Quality Task Force to develop equitable policies for emissions from activities that could be classified as agricultural burning.

This policy addresses the impacts of air pollutant emissions from fires managed for resource benefits on public health and welfare. The primary indicators of public health impacts used are ambient air quality impacts above the NAAQS for fine particles with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers ($PM_{2.5}$), and particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers (PM_{10}). There are both 24-hour (daily) and annual NAAQS for $PM_{2.5}$ and PM_{10}. Emissions of nitrogen oxides (NO_x), VOC, and CO from fires can also impact the NAAQS for NO_2, O_3, and CO. However, the actions required to reduce VOC and CO emissions are the same as those recommended in this document to mitigate impacts on the $PM_{2.5}$, and PM_{10} NAAQS. Emissions of NO_x, on the other hand, can increase under some of the burning conditions used to decrease emissions of other pollutants.

The effects of fire emissions on the public welfare aspects of the NAAQS for PM are addressed in terms of visibility impairment and regional haze. The policy also addresses the treatment of fire emissions to meet other CAA requirements, such as prevention of significant deterioration (PSD) and conformity with SIP's or TIP's.

III. BACKGROUND

A. The Role of Fire in the Wildlands

The role of fire in North American ecosystems has been undergoing change since people began to play a more active role in managing their natural resources. Native Americans actively used fire to alter vegetative patterns, to ease travel, or for hunting purposes. Prior to European

[2]See memorandum from Mary D. Nichols, Assistant Administrator for Air and Radiation to EPA Regional Offices titled Areas Affected by PM_{10} Natural Events, May 30, 1996.

settlement, fire played a natural role as a necessary disturbance phenomena, keeping fuel density in check as well as insects and the diseases they carry, thereby maintaining North American wildlands in a healthy state. After European settlement and the introduction of grazing herds of cattle and sheep, and the practice of fire suppression, public land management agencies have recognized that not allowing fire to play its natural role in our wildlands has had unintended negative effects. When forests and grasslands are not allowed to burn naturally (lighting serving as the principal source of ignition) the result can be heavy accumulation of dead vegetation which provides fuel for unwanted fires (wildfires). Because of this unhealthy build-up of fuels, the risk of catastrophic wildfires is much greater as evidenced by several recent fires in our national forests and other publicly owned lands. These fires put firefighters and the general public in danger while destroying millions of acres of forests and costing millions of dollars to suppress. The lack of fire also has unintended ecological effects, leading to the loss of habitat for rare species and the decline of ecosystems. Fire exclusion can lead to an alteration in natural community types, and an important loss of biodiversity. Many plant and animal species are on the decline because they exist in fire-dependent habitats that haven't burned in decades. This situation has led to a rethinking of Federal land management and fire management policy.

B. Changes in Fire Management Policy

In 1995, a Federal Wildland Fire Management Policy and Program Review was conducted in response to the unhealthy condition of our public wildlands, and the increase in unplanned fires that occurred in 1987, 1988, 1992 and again in 1994. As a result of this review, the five principal Federal fire/land management agencies [the Forest Service (FS) under the Department of Agriculture; and the Bureau of Land Management (BLM), National Park Service (NPS), Fish and Wildlife Service (FWS), and the Bureau of Indian Affairs (BIA) under the DOI] agreed on need for several changes to existing fire/land management practices. Their recommendations include the reintroduction of fire (allowing it to play its natural role) into Federal land management programs in "an ongoing and systematic manner, consistent with public health and environmental quality considerations." The goals of this change in land management policy are to reduce unnatural fuel densities that contribute to increasing unplanned fire hazards, and to restore wildland ecosystems to their healthy natural states. The Federal agencies previously mentioned

began increasing the use of fire in their most vulnerable wildlands in 1997. Annual treatment targets for all Federal land management agencies will be increased to more than 5 million acres per year by 2005.

C. Air Quality Considerations

Burning wildland vegetation causes emissions of many different chemical compounds such as small particles, No_x, CO and organic compounds. The components and quantity of emissions depends in part on the types of fuel burned, its moisture content, and the temperature of combustion. Complex organic materials may be absorbed into or onto condensed smoke particles. Tests indicate that, on average, 90 percent of smoke particles from wildland and prescribed fires are PM_{10}, and 70 percent are $PM_{2.5}$.

Historically, EPA's NAAQS for PM have tended to focus emission control efforts on "coarse" particles--those larger than $PM_{2.5}$. Before 1987, EPA's PM standards focused on "Total Suspended Particles," including particles as large as 100 micrometers in diameter. The EPA revised the standards in 1987 to focus control on PM_{10} in response to new science showing that it was the smaller particles capable of penetrating deeply into the lungs that were associated with the most adverse health effects. For comparison, a human hair is about 70 micrometers in diameter.

The most recent review of health studies focused attention on the need to better address the "fine" fraction particles - $PM_{2.5}$. These more recent studies provide consistent and coherent, "evidence that serious health effects (mortality, exacerbation of chronic disease, increased hospital admissions, etc.) are associated with exposures to ambient levels of PM found in contemporary urban airsheds even at concentrations below current U. S. PM standards" (Criteria Document-U.S. EPA 1996a, p. 13-1). PM concentrations currently found in many communities are associated with adverse health effects in the general population, including increased mortality and morbidity, altered lung function, increased respiratory symptoms, aggravated respiratory and cardiovascular disease. Sensitive sub-populations, such as children, the aged and those with existing cardiopulmonary or infectious respiratory disease, may experience effects at lower levels of PM than the general population, and the severity of effects might be greater. These studies are the basis for the July, 1997 promulgation of new NAAQS for $PM_{2.5}$, which are designed to

protect public health, with an adequate margin of safety.

Fine particles are also a major cause of visibility impairment in such places as national parks that are valued for their scenic views and recreation.

D. <u>Visibility Impairment</u>

Visibility conditions are affected by scattering and absorption of light by particles and gases. The fine particles most responsible for visibility impairment are sulfates, nitrates, organic compounds, soot and soil dust. Fine particles are more efficient per unit mass than coarse particles at scattering light. Light scattering efficiencies also go up as humidity rises, due to water adsorption on fine particles, which allow the particles to grow to sizes comparable to the wavelength of light. There are distinct regional variations in visibility between eastern and western States, due, to generally higher relative humidities in the East. Naturally occurring visual range in the East may be between 105 to 190 kilometers, while natural visual range in the West is between 190 to 270 kilometers.

Visibility is an important public welfare consideration because of its significance to enjoyment of daily activities in all parts of the country. Protection of visibility as a public welfare consideration is addressed nationally through the secondary PM NAAQS which are equivalent to the primary PM NAAQS. Visibility protection is particularly important in the 156 mandatory Class I Federal areas, "Areas of Great Scenic Importance," and is addressed for these areas by the special provisions of Sections 169A and 169 B of the CAA.

The effects of smoke from wildland and prescribed fires on air quality will be discussed throughout this document. The term air quality, as used in this document, refers to ambient concentrations of pollutants (primarily PM in locations accessible to the general public), and, where applicable, to impacts on visibility in mandatory Class I Federal areas. Thus, wherever this document discusses the need for wildland owners/managers to consider the impacts of their actions on air quality, this may include consideration of the effects of their actions on visibility in mandatory Class I Federal areas.

Existing requirements to consider effects on visibility which are reasonably attributable to a single nearby source or small number of sources are contained in the regulations published by EPA in 1980 at 40 CFR 51.300 (Protection of Visibility). Additional regulations are currently

being developed to address impairment of visibility that is more regional in its character and origins ("regional haze"). This interim policy may be revised to be made consistent with the regional haze rules when they become final.

Please refer to the white paper, "Background on the Role of Fire," for more complete background information. See Section I to obtain a copy.

IV. DESCRIPTION OF POLICY

The EPA's policy regarding wildland and prescribed fires managed for resource benefits is that owners/managers of public, private and Indian wildlands should collaborate with State/tribal air quality managers (air regulators) to achieve their goals of: (1) allowing fire to function in its natural role in the wildlands, and (2) protecting public health and welfare by minimizing smoke impacts. The EPA urges air quality managers to participate in public land use planning activities which involve selecting appropriate resource management treatments, including the use of fire, and to help identify air quality criteria for fire management plans. Air quality managers are urged to help evaluate the potential impacts of alternative resource treatments and assure that air quality concerns (also visibility and regional haze concerns, where appropriate) are adequately addressed in the public land use planning process. They are urged to solicit information from private and Indian wildland owners/managers on plans to use fire for resource management, to encourage them to consider appropriate alternative treatments, and to assist them in evaluating the potential air quality impacts of alternatives to meet particular management objectives.

Wildland owners/managers are urged to: (1) notify air quality managers of plans to significantly increase their future use of fire for resource management, (2) consider the air quality impacts of fires and take appropriate steps to mitigate those impacts, (3) consider appropriate alternative treatments, (4) and participate in the development and implementation of State/tribal SMP's.

The EPA will allow States/tribes flexibility in their approach to regulating fires managed for resource benefits. They are not required to change their existing fire regulations if those regulations adequately protect air quality. However, there are incentives for States/tribes to certify to EPA that they have adopted and are implementing a SMP that includes the basic components identified in this policy. The main incentive is that, as long as fires do not cause or

significantly contribute to daily or annual PM2.5 and PM10 NAAQS violations, States/tribes may allow participation by burners in the basic SMP to be voluntary and the SMP does not have to be adopted into the SIP. Another incentive is the commitment by EPA to use its discretion not to redesignate an area as nonattainment when fires cause or significantly contribute (see section VII.B.) to PM NAAQS violations, if the State/tribe required those fires to be conducted within a basic SMP. Rather, if fires cause or significantly contribute violations, States/tribes will be required to review the adequacy of the SMP, in cooperation with wildland owners/managers, and make appropriate improvements.

If States/tribes do not certify that a basic SMP is being implemented, no special consideration will be given to PM violations attributed to fires managed for resource benefits. Rather, EPA will call for a SIP revision to incorporate a basic SMP and/or will notify the governor of the State or the tribal government that the area should be redesignated as nonattainment. The SMP adopted in response to the SIP/TIP call must require mandatory participation for greater than de minimis fires, and must be adopted into the SIP/TIP so that it is Federally enforceable. Also, the SIP/TIP must meet all other CAA requirements applicable to nonattainment areas.

Fire data requirements for SIP's/TIP's are addressed in section VIII of this policy. Guidance for meeting CAA requirements to show conformity of Federal fire activities with SIP's, to address visibility/regional haze impacts, and to address prevention of significant deterioration of air quality are addressed in section IX.

The following are guiding principles for implementing this policy:

- Air quality and visibility impacts from fires managed for resource benefits should be treated equitably with other source impacts.
- Land and vegetation management practices should be promoted that are best for wildland ecosystems, yet protect public health and avoid visibility impairment.
- States/tribes should foster collaborative relationships among wildland owners/managers, air quality managers and the public to develop and implement SMP's.
- States/tribes will be allowed the flexibility (prior to measuring violations of the $PM_{2.5}$ or PM_{10} NAAQS attributable to fires managed for resource benefits) to decide when a SMP

is needed and how the program will be designed to prevent adverse air quality impacts. This does not preclude wildland owners/managers from including smoke management components in burn plans for fires they conduct in the absence of an applicable State/tribal program.

- All parties (wildland owners/managers, air quality managers and the public) are expected to act in good faith and will be held accountable for implementing their respective parts of fire and SMP's.

V. COLLABORATION AMONG LAND AND AIR QUALITY MANAGERS

Wildland owners/managers and air quality managers can overcome the barriers to achieving their goals of: (1) returning fire to its natural role in the wildlands and (2) protecting air quality and visibility, by working together toward those ends. Wildland owners/managers should notify State/tribal air quality managers if they are planning to significantly increase the use of fire to manage wildland resources. Air quality managers with Federal/State/local public wildlands within their jurisdictions have a responsibility to participate in the public planning processes conducted for the management of those publicly owned lands. To arrive at the best choice of resource treatments and response to fire, it is essential that the air quality impacts of planned land management activities are adequately addressed. Air quality managers, by participating in the public land use planning process, can help select the scope of land uses; help evaluate alternative management tools and help identify when fire is appropriate; and review projected air quality and visibility impacts. Air quality managers should also consult with private wildland owners/managers to determine long-range resource management objectives and help them evaluate the applicability of alternative treatments based on air quality and visibility considerations.

Wildland owners/managers also have a responsibility to participate with the other stakeholders and State/tribal air quality managers in developing rules and SMP's for fires managed for resource benefits. Air quality managers that intend to develop or revise regulations, plans or policies applicable to fires should solicit the early participation of all affected wildland owners/managers in making those revisions.

A. <u>Land and Vegetation Management</u>

Wildlands are managed by Federal, State and local public agencies (referred to in this document as public land management agencies); tribal and BIA authorities; and private land owners. The goals of public land management agencies vary, but are generally to develop, maintain and enhance wildlife habitat; protect endangered plant and animal species; preserve and protect cultural resources, scenic vistas and wilderness; provide for recreation; and to sustain production of natural resources. The goals of private wildland owners/managers may be sustained production of natural resources, preservation of wildlife habitat, improved grazing conditions, etc. The goals of tribal wildland owners/managers are generally similar to public land management agency goals, but may also include aspects of private land owners. Another common goal of all wildland owners/managers is to minimize the potential for catastrophic wildfires that could result from heavy accumulations of vegetative fuels.

1. Alternative Treatments

Wildland owners/managers may have an array of tools, including fire, that can be used to accomplish land use plans, depending on the resource benefits to be achieved. Several factors should be considered when selecting appropriate treatments. Those factors include the costs of treatment, the environmental impacts (e.g., air and water quality, soils, wildlife, etc.), and whether fire must be used to meet management objectives. The best combination of treatments are those that meet management goals with the most favorable environmental impacts at the most reasonable costs.

a. <u>Utilization and mechanical treatments</u>

Mechanical treatments may be appropriate tools when management objectives are to reduce fuel density to reduce a wildfire hazard, or to remove logging waste materials (slash) to prepare a site for replanting or natural regeneration. On-site chipping or crushing of woody material, removal of slash for off-site burning or biomass utilization, whole tree harvesting, and yarding (pulling out) of unmerchantable material may accomplish these goals. Mechanical treatments are normally limited to accessible areas, terrain that is not excessively rough, slopes of 40 percent or less, sites that are not wet, areas not designated as national parks or wilderness, areas not protected for threatened and endangered species and areas without cultural or paleological resources.

b. Chemical treatments

When the management objective is to preclude, reduce or remove live vegetation and/or specific plant species from a site, chemical treatments may be appropriate tools. Other potential environmental impacts caused by applying chemicals must also be considered, however.

c. Fire treatments

Fire is one of the basic tools relied upon by wildland owners/managers to achieve a myriad of management objectives in fire dependent ecosystems. Most North American plant communities evolved with recurring fire and, therefore, are dependent on recurring fire for maintenance. The natural fire return interval may vary from 1-2 years for prairies, 3-7 years for some long-needle pine species, 30-50 years for species such as California chaparral, and over one hundred years for species such as lodgepole pine and coastal Douglas-fir. When one management objective is to maintain a fire dependent ecosystem the effects of fire cannot be duplicated by other tools. In such cases, fire may be the preferred management tool even when other treatments may be equally effective for meeting other objectives. Fire can also be used to reduce heavy fuel loads and prevent catastrophic wildfires.

When fire is the chosen management tool, a combination of treatment methods may be the best approach to achieving the desired resource benefits with minimum air quality impacts. Combinations of treatments may include mechanically pretreating an area to thin the fuel load prior to the use of fire.

2. Role of Federal Land Managers (FLM's)

The major Federal agencies with land management responsibilities include the USDA FS, the DOI NPS, and FWS, BLM, and BIA. These agencies manage national parks, forests, monuments, wilderness areas, prairie grasslands, sea shores, Indian lands, wildlife refuges, etc. The Department of Defense and Department of Energy also manage millions of acres of Federal land at military bases, training centers and for other purposes.

a. Federal land use and fire management planning

Federal land use planning is an open process for setting land use and management goals and objectives. The planning process is designed for public participation, and must comply with NEPA. State/tribal air quality managers are given the opportunity to participate in land use

planning as part of normal intergovernmental consultation procedures. It is important for air quality managers to participate in public land use planning decisions to ensure that air quality concerns are adequately addressed. Through the public participation process, issues are identified and alternatives are discussed regarding methods for implementing land management activities such as trail building, improvement of wildlife habitat, timber harvesting, use of fire, etc. The environmental impacts of these activities are analyzed including, among other things, impacts on cultural resources, wildlife, vegetation, soils, riparian areas, wetlands, water quality, air quality, and visibility. Consideration of the air quality impacts of land management activities is essential to arriving at the best choice of treatments and response to fire.

Two or more levels of land use planning are conducted by FLM's to achieve management goals. First, broad scale and long-range land use plans must be developed for administrative units (e.g., forests, parks, refuges, sanctuaries, etc.). The land use plan identifies the scope of actions and goals for the lands and resources administered, and typically covers a 10 to 15-year period.

In addition to land use plans, there are other shorter term (typically 1-5 years) planning efforts where decisions are made concerning specific activities and programs, including the use of fire to achieve resource benefits. These may include programmatic plans, such as FMP's, or specific project plans.

The FMP's are strategic plans that define how wildland and prescribed fires will be managed to meet land use objectives. The FMP's must contain prescriptive criteria which are measurable and will guide selection of appropriate management actions in response to fires. The criteria can relate to suppression actions or describe when fire can be managed to gain resource benefits. This allows the use of a full range of appropriate management responses to fire, which may include: full suppression of a wildland fire; suppression on part of a wildland fire while allowing another portion of the fire to continue playing a natural ecological role and achieve resource benefits; or the use of prescribed fire.

Project plans are strategic plans to accomplish specific actions and goals established in a land use plan. Project plans may involve decisions regarding trade-offs between using mechanical, chemical and fire treatments. When projects include fires treatments, burn plans are also required. Burn plans are operational plans for managing specific fires. Burn plans prepared by

FLM's should include smoke management components to minimize fire emissions and mitigate air quality impacts.

b. <u>Evaluating environmental impacts</u>

Federal agencies evaluate the environmental impacts of the tools used for resource management on publicly owned lands using NEPA. They generally consider the impacts on, among other things, plant and animal species in the area, aquatic life, cultural resources, soil conditions, riparian areas, wetlands, water quality, air quality and visibility. Such analyses should be undertaken at both the individual project planning level and at the regional planning level if warranted by the extent of similar activities over a large area.

The impacts of resource management activities, particularly fire, on air quality can vary significantly by region. The impacts can be strongly affected by meteorology; existing air quality; the size, timing and duration of the activity; and other activities occurring in the same airshed at the same time. State/tribal air quality managers can provide technical assistance with evaluating potential air quality impacts, thus aiding FLM's in their selection of tools and evaluation of the environmental impacts.

Air quality and visibility impact evaluations of fire activities on Federal lands should:

- include recent historic (e.g. 10 years) and projected (life of the plan) annual or seasonal emissions from wildland and prescribed fires. Emission projections should be based on estimates provided by wildland owners/managers of acres burned, pre-burn fuel loading by vegetation type and consumption,
- be related to analyses of cumulative impacts of fires on regional and subregional air quality, when possible.
- identify applicable regulations, plans or policies (e.g. burn plans, authorization to burn, conformity, etc.),
- identify sensitive receptors,
- include description of planned measures to reduce smoke impacts,
- identify the potential for smoke intrusions into sensitive areas, and model air quality and visibility impacts, when possible,
- describe ambient air monitoring plans, when appropriate.

3. Role of State and Other Public Land Managers

State and local land management agencies manage publicly owned lands similar to Federal lands. These agencies differ from agency to agency, but can include forestry, conservation, park service, or fish and game agencies, as well as State or local fire protection agencies. Many agencies prepare long-range land use plans as well as project specific plans. The FMP's, similar to those prepared by Federal agencies, may also be prepared. Public land management agencies generally assess the environmental impacts of proposed projects, such as fires managed for resource benefits, although the impacts evaluated vary from agency to agency.

Some State/local wildland managers also have responsibilities for private lands. Such responsibilities may include using fires and other fuels reduction programs aimed at reducing the potential for wildfires in the wildland/urban interface.

Land use planning for State and locally owned wildlands, although somewhat different from the Federal process, also requires preparation of written documents that are subject to public review. State/local wildland managers should notify air quality managers of long-range plans to use fire for resource management. They should consider alternative management tools and evaluate the potential air quality impacts of fires. State/local wildland managers should also participate in the development of State SMP's.

4. Role of Private Land Managers

Private wildland owners/managers may or may not prepare written land use or project plans depending on the organization and the size of the property. States/tribes may or may not require written plans, but activities on privately owned lands must meet all applicable State and Federal environmental requirements. State requirements include any specific SIP requirements applicable to private land owners which are designed to ensure that the State complies with CAA requirements. Private land owners/managers should provide information to the State on long-range plans to use fire for resource management and should participate in the development of State SMP's.

5. Role of Indian Land Managers

Land use plans for Indian wildlands are not subject to review by the general public and are not subject to State regulations. Activities on Indian lands must meet the requirements of the CAA and the TIP, however, if one has been adopted. It is important that Indian wildland managers consider alternative vegetation management tools and consider the air quality impacts of the management practices chosen both on and off of Indian lands. They are encouraged to collaborate with other near-by wildland owners/managers and air quality managers on regional SMP's to assure that fires managed for resource benefits will not cause adverse air quality impacts at sensitive receptors in the region.

6. Role of Air Quality Managers

State air quality managers which have publicly owned wildlands within their jurisdiction, have a responsibility to participate in the public planning process conducted for those lands to be assured that air quality concerns are adequately addressed and they can meet the goals of their SIP's. They can participate in selecting the scope of land uses, identify air quality issues, and participate in evaluating and selecting alternative resource management tools. They can also participate in identifying basic air quality criteria for fire prescriptions. To accomplish this, air quality agencies should heed solicitations of public participation from land managers and contact public land management agencies within their jurisdiction

State/tribal air quality managers should also encourage private and Indian wildland owners/managers to consider alternative treatments and help them evaluate the potential air quality impacts of alternatives to meet particular management objectives.

B. Air Quality Management

State/tribal air quality managers are responsible for adopting plans and rules sufficient to attain and maintain national and State air quality standards, prevent significant deterioration of air quality, remedy existing visibility impairment and prevent future impairment in mandatory Class I Federal areas caused by manmade sources of pollution. This is accomplished mainly by developing SIP's and TIP's. The SIP's/TIP's include all programs and rules required by the CAA to meet and assure maintenance of Federal standards. The SIP's/TIP's are frequently amended as State/tribal rules are revised and new rules are adopted to meet changing CAA requirements. The

EPA has the authority to adopt and implement Federal Implementation Plans (FIP's) to address air quality protection in areas where States or tribes do not adopt plans.

1. Role of State/Local Air Quality Managers

The SIP's are developed in an extensive public process involving workshops and public hearings in which all stakeholders are invited to participate in developing the technical components of the plans including: (1) emission inventories; (2) modeling analyses; (3) attainment demonstrations; (4) transportation and general conformity emission budgets; (5) analyses of air quality data; and (6) control strategy development. State/local air quality managers should solicit information on the planned use of fire for resource management from all wildland owners/managers, just as they obtain information on other emission sources within their jurisdiction, when fires are expected to significantly impact air quality. Air quality managers should also work with adjacent States to mitigate potential impacts from interstate transport of smoke.

2. Role of Tribal Air Quality Managers

Eligible tribes may develop TIP's to administer CAA requirements on Indian lands. The CAA recognizes tribal governments as the most appropriate parties to regulate the environment on Indian lands and grants EPA the authority to approve tribal programs. The EPA has developed strategies for Federally implementing CAA requirements if tribes do not adopt TIP's.

Tribal air quality managers should solicit information on the planned use of fire for resource management within their jurisdiction and the potential for air quality impacts on or from adjacent jurisdictions. They are encouraged to collaborate with other near-by air quality managers to develop regional SMP's which assure that fire activities will not cause adverse air quality impacts at sensitive receptors in the region.

3. Role of Public Land Managers

Public land managers have the responsibility to participate with the other stakeholders and air quality managers in developing SIP's. Public land managers, as experts in what is needed to meet land use and other environmental objectives, need to provide information on the areas that are to be treated with fire, air pollutant emissions estimates, and assistance in developing programs to track emissions, monitor air quality and visibility, and mitigate air quality impacts.

The FLM's of mandatory Class I Federal areas must participate in the development of SIP's for regional haze and visibility impairment. Congress gave FLM's a key consulting role in the administration of visibility protection and "affirmative responsibility to protect air quality related values (including visibility) in mandatory Class I Federal areas." [See section 165 of the CAA.]

VI. SMOKE MANAGEMENT PROGRAMS (SMP's)

The SMP's establish a basic framework of procedures and requirements for managing smoke from fires managed for resource benefits and are typically developed by States/tribes with cooperation and participation by wildland owners/managers. The purposes of SMP's are to mitigate the nuisance and public safety hazards (e.g., on roadways and at airports) posed by smoke intrusions into populated areas; to prevent deterioration of air quality and NAAQS violations; and to address visibility impacts in mandatory Class I Federal areas. Some strong indications that an area needs a SMP are: (1) citizens increasingly complain of smoke intrusions; (2) the trend of monitored air quality values is increasing (approaching the daily or annual NAAQS for $PM_{2.5}$ or PM_{10}) because of significant contributions from fires managed for resource benefits; (3) fires cause or significantly contribute to monitored air quality that is already greater than 85 percent of the daily or annual NAAQS for $PM_{2.5}$ or PM_{10}; or (4) fires in the area significantly contribute to visibility impairment in mandatory Class I Federal areas.

If a State/tribe determines that a SMP is needed, they can adopt any type of program they believe will prevent NAAQS violations and address visibility impairment. For example, general fire regulations may establish basic parameters, such as wind speed, direction, location and distance to sensitive receptors, etc., within which fires can be ignited or naturally ignited fire can be allowed to continue to burn. States/tribes may allow wildland owners/managers to voluntarily notify them of fire plans or may require prior authorization. They may also exempt de minimis fires (fires that will cover fewer than X acres or consume less than Y tons of fuel, as established by the State/tribe) from meeting the regulations. Such regulations leave much discretion to wildland owners/managers as to when to ignite fires, and what management strategy to follow with naturally ignited fires. States/tribes may exercise enforcement authorities when wildland owners/managers are found to have ignited the fire outside of the parameters of the rule, or not to

have appropriately responded to air quality impacts caused by naturally ignited fires.

General fire regulations may be adequate for areas where fires managed for resource benefits rarely cause or contribute to air quality problems. However, when plans to use fire on a large scale could cause significant air quality impacts, or several wildland owners/managers within an airshed are expected to use fires concurrently, a more structured SMP requiring cooperation and coordination of fire activities may be required to minimize emissions and mitigate the air quality impacts.

State/tribal air quality managers, public wildland managers, private and Indian wildland owners/managers, and the general public should collaborate in the development and implementation of State/tribal SMP's. The State/tribal air quality manager must certify in a letter to the Administrator of EPA that at least a basic program has been adopted and implemented in order to receive special consideration under this policy of air quality data resulting from fire impacts, as explained in section VII. The SMP does not have to be incorporated into the SIP/TIP or be Federally enforceable, however. The following describes the basic components (A - F) of a certifiable SMP. There is considerable latitude within the components for individual State/tribal preferences.

A. Authorization to Burn

The SMP should include a process for authorizing or granting approval to manage fires for resource benefits within a region, State, or on Indian lands and identify a central authority responsible for implementing the program. The process may be as simple as receiving applications for permission to burn and granting approval via telephone or facsimile. The SMP central authority must review fire applications, consult with the applicants, if necessary, and promptly make burn/no burn decisions. When authorizing a fire, the authority should consider all open burning activities (land clearing and construction wastes, agricultural wastes, etc.) allowed within an airshed. The central authority should strive to treat public and private wildland owners/managers equitably when authorizing fires. Neighboring States/tribes are encouraged to create partnerships to coordinate fire projects when inter-jurisdictional impacts are expected, so as to meet air quality and fire management objectives. Fire emissions should be minimized and the air quality impacts should be mitigated regardless of political boundaries.

States/tribes may or may not require written burn plans for de minimis fires, especially if the central authority records pertinent fire information. However, written burn plans are strongly recommended for greater than de minimis fires. Burn plans should be prepared by the wildland owners/managers. The central authority should assist private land owners that cannot prepare their own plans. When written burn plans are required, especially for fires on publicly owned lands, they should include such information as the:

- location and description of the area to be burned,
- personnel responsible for managing the fire,
- type of vegetation to be burned,
- area (acres) to be burned,
- amount of fuel to be consumed (tons/acre),
- fire prescription including smoke management components (discussed below),
- criteria the fire manager will use for making burn/no burn decisions,
- safety and contingency plans addressing smoke intrusions.

The central authority's criteria for authorizing fires should be based on existing air quality and the ability of the airshed to disperse emissions (e.g., meteorological conditions) from all burning activities on the day of the burn. For fires lasting longer than one day, predicted meteorological conditions for several days should be considered to avoid aggravating existing problems. Persons receiving authorization to ignite fires must comply with all applicable local, State, tribal and Federal requirements. Persons responsible for managing greater than de minimis fires should be adequately trained in fire and smoke management. Fire managers should be required to follow the authorized burn plan or explain why it was necessary to deviate from the plan.

B. Minimizing Air Pollutant Emissions

The SMP should encourage wildland owners/managers to consider the alternative treatments discussed in section V.A.1., above. Public land managers typically consider and evaluate alternative treatments that may achieve management objectives, their costs and the environmental impacts of each method. States/tribes should assist private land owners to also identify economically feasible treatments that will meet their objectives with minimum air pollutant

emissions. When the use of fire is selected as the best means to accomplish management goals, there are several ways to reduce emissions from a single fire. The approaches fall into four categories and their applicability varies by fuel type, (1) minimize the area burned, (2) reduce the fuel loading in the area to be burned, (3) reduce the amount of fuel consumed by the fire, (4) minimize emissions per ton of fuel consumed. These emission reduction techniques rely almost exclusively on reducing the amount of fuel consumed by a particular fire. The excluded fuels could be consumed by a subsequent fire, however, unless they are removed from the area or biologically decompose. Also, generally these techniques cannot be used to reduce emissions from naturally ignited fires.

Emission reduction techniques are discussed further in the white paper "What Wildland Fire Conditions Minimize Emissions and Hazardous Air Pollutants and Can Land Management Goals Still be Met?" See Section I to obtain a copy.

C. <u>Smoke Management Components of Burn Plans</u>

When burn plans are required they should include the following smoke management components.

1. Actions to Minimize Fire Emissions

The burn plan should document the steps taken prior to the burn and actions that will be taken during and after the burn to reduce air pollutant emissions. This includes measures that will be taken to reduce residual smoke, such as rapid and complete mop-ups, mop-ups of certain fuels, etc.

2. Evaluate Smoke Dispersion

The central authority should evaluate dispersion conditions prior to authorizing fires. Burn plans should evaluate potential smoke impacts at sensitive receptors and time fires to minimize exposure of sensitive populations and avoid visibility impacts in mandatory Class I Federal areas. The plan should identify the distance and direction from the burn site to local sensitive receptor areas and to regional/interstate areas where appropriate. Fire prescriptions submitted prior to the day of the fire must specify minimum requirements for the atmospheric capacity for smoke dispersal such as minimum surface and upper level wind speeds, desired wind direction, minimum mixing height, and dispersion index. It may be necessary to purchase

meteorological services from private companies if they are not available from the National Weather Service.

3. Public Notification and Exposure Reduction Procedures

The plan should identify actions that will be taken to notify populations and authorities (e.g., local air quality managers) at sensitive receptors, including those in adjacent jurisdictions, prior to the fire. The plan should also identify contingency actions that will be taken during a fire to reduce the exposure of people at sensitive receptors if smoke intrusions occur. The central authority should perform these functions, if needed, for some private land owners. Appropriate short-term (less than 24-hour) contingency actions may, among other things, include:

- Notifying the affected public (especially sensitive populations) of elevated pollutant concentrations,
- Suggesting actions to be taken by sensitive persons to minimize their exposure (e.g., remain indoors, avoid vigorous activity, avoid exposure to tobacco smoke and other respiratory irritants),
- Providing clean-air facilities for sensitive persons,
- Halting ignitions of any new open burning that could impact the same area,
- Analyzing the fire situation and identifying alternative management responses upon becoming aware that a fire is out of air quality prescription with regard to the air quality criteria, (Federal land management agencies perform a Wildland Fire Situation Analysis)[3],
- Consulting State/tribal air quality managers regarding appropriate short-term fire management response to abate verified impacts,
- Implementing management responses that will mitigate the adverse impacts to public health,

---

[3] A Wildland Fire Situation Analysis (WFSA) is a decision-making process that evaluates alternative fire management strategies considering fire fighter and public safety, risk to property and resources, fire fighting resources available, land management objectives, and environmental, social, economic and political constraints. The environmental and social constraints considered include, among other things, how air quality and/or visibility will be affected at sensitive receptors by each alternative fire management strategy. The positive, neutral or negative effects of each alternative on the criteria above are weighed to select the appropriate management response to the fire. Therefore, while mitigating air quality and visibility impacts must be considered by the FLM when managing a fire that is not within a prescription, they are just two of several important criteria evaluated.

- Reporting the steps taken to mitigate adverse impacts to the public and appropriate State/tribal agencies after they have been completed.

4. Air Quality Monitoring

The plan should identify how the effects of the fire on air quality at sensitive receptors, and visibility in mandatory Class I Federal areas will be monitored. The extent of the monitoring plan should match the size of the fire. For small fires, visual monitoring of the direction of the smoke plume and monitoring nuisance complaints by the public may be sufficient. Other monitoring techniques include posting personnel on vulnerable roadways to look for visibility impairment and initiate safety measures for motorists; posting personnel at other sensitive receptors to look for smoke intrusions; using aircraft to track the progress of smoke plumes; and continued tracking of meteorological conditions during the fire. For large fires expected to last more than one day, locating real-time PM monitors at sensitive receptors may be warranted to facilitate timely response to smoke impacts. If needed, the central authority may perform these monitoring functions for some private land owners.

For additional information on monitoring wildland fire impacts see the white paper "Air Monitoring for Wildland Fire Operations." See Section I to obtain a copy.

D. Public Education and Awareness

The SMP should establish criteria for issuing health advisories when necessary, and procedures for notifying potentially affected populations, including those in adjacent jurisdictions, of planned fires. A program should be implemented to explain the use and importance of fire for ecosystem management, the implications to public health and safety, and the goals of the SMP. Wildland and air quality managers should work with the press to announce pre-fire health advisories, and post-fire results including such things as the management objectives met; smoke intrusions observed, and/or successful minimization of air quality impacts.

E. Surveillance and Enforcement

The SMP should include procedures to ensure that wildland owners/managers will comply with the requirements of the SMP. Fire managers must follow the burn plan, including the fire prescription and smoke management components, or explain any deviations from the plan. Memorandums of understanding may be used to specify the responsibilities of each State/tribal

agency in implementing the SMP.

F. Program Evaluation

The SMP should provide for periodic review by all stakeholders of its effectiveness and revision of the program as necessary. The effectiveness review should be based on observations such as reports of smoke intrusions, nuisance complaints, and monitored air quality impacts. Post-burn reports should be required for fires that exceed their air quality prescription and/or fires that cause smoke impacts at sensitive receptors. Post-burn reports for escaped fires should describe the incident, describe the contingency plan implemented, and provide recommendations to prevent future smoke related problems.

State/tribal SMP's should include procedures for re-evaluating the effectiveness of rules and regulations every 3 to 5 years. Such procedures should involve all the original participants (e.g., wildland owners/managers, air quality managers, the public, etc.) and should review the:

- Acres of fires managed for resource benefits planned for the next 5 years,
- Need to expand the scope of the program to include authorization of other open burning,
- Need for changes in the SMP.

G. Optional Air Quality Protection

The following components are not required in a basic SMP, but States/tribes may adopt more stringent SMP's or include additional smoke management requirements. For example, "special protection zones" may be established to provide better protection against smoke impacts. Special protection zones could be buffers (e.g., 10 - 25 miles) around wildland/urban interface areas, nonattainment areas, or mandatory Class I Federal areas. Additional requirements for burns within a special protection zone may include no burning if high pollution levels already exist in the area. Also, special protections may only be required for burns that will last overnight, for multi-day burns or burns during specific seasons.

States/tribes may also establish "performance standards" that would trigger implementation of additional smoke management requirements if exceeded in an area. The performance standards could set limits on the frequency and intensity (e.g., hours/day, PM concentration, visibility impairment) of smoke intrusions. Implementation of performance

standards may require real-time monitoring of air quality. Additional requirements for fires after the performance standards are exceeded may include better dispersion parameters (e.g., increased wind speed, mixing height, dispersion index, etc.).

VII. ACCOUNTABILITY

A. Role of State/Tribal Air Quality Managers

High PM concentrations attributable to fires managed for resource benefits are valid air quality data that can be used to determine the attainment status of the area represented by the data for both the daily and annual NAAQS. State/tribal air quality managers are responsible for monitoring citizen complaints and air quality trends attributable to fires to determine when a SMP is needed to minimize emissions and mitigate air quality impacts. Air quality managers should initiate the collaborative process needed to develop and adopt regulations for a SMP. If the State/tribal air quality manager certifies in a letter to the Administrator of EPA that at least a basic program (described in section VI) has been adopted and implemented, special consideration will be given under this policy to air quality data resulting from fires managed for resource benefits.

1. Wildfires

High PM concentrations attributable to wildfires (unwanted wildland fires) can be treated as due to a natural event under EPA's Natural Events Policy. The Natural Events Policy provides that when areas violate the PM_{10} NAAQS due to a natural event, EPA will: (1) exercise its discretion, under section 107(d)(3) of the CAA, not to redesignate areas as nonattainment if the State develops and implements a plan to respond to the health impacts of natural events; and, (2) redesignate nonattainment areas as attainment by applying appendix K, on a case-by-case basis, to discount [ambient air quality] data in circumstances where an area would attain but for exceedances that result from uncontrollable natural events. The elements of a State/tribal action plan to respond to the health impacts of natural events are described in the Natural Events policy statement. The EPA plans to revise the Natural Events Policy to also cover $PM_{2.5}$ NAAQS violations.

2. Fires Managed for Resource Benefits

High PM concentrations attributable to fires managed for resource benefits will be given special consideration under this policy, as described in section VII.B., if the State/tribe has

certified to EPA that it is implementing a basic SMP. States/tribes should flag monitored values influenced by fires when submitting the data to EPA's Atmospheric Information Retrieval System. They must also document the basis for flagging the data. Supporting information could include the location of fires relative to the monitor, meteorological data such as wind speed and direction, filter analyses indicating heavy carbon deposits, the sample date (collected during the fire season), and the absence of other carbon sources during that period, among other things. The documentation should address the possible influence of other carbon sources such as wood-fired boilers, residential wood combustion and wildfires. The type and amount of documentation should be sufficient to demonstrate that fires managed for resource benefits caused flagged values to be above the level of the annual NAAQS. The documentation should be made available to the public for review. [For example, newspaper announcements, periodic air quality reports, distribution at public meetings.]

When smoke intrusions cause high PM concentrations, air quality managers have two goals: (1) to reduce immediate impacts on public health, and (2) to take appropriate steps to mitigate future impacts. To meet these goals, air quality managers must contact the wildland owner/manager responsible for the fire(s) to determine the cause of the impacts. The air quality manager should verify that contingency actions to reduce exposure are being implemented, and determine whether, (i) the fire was authorized, (ii) a burn plan (including the smoke management components) was followed, (iii) the prescription failed and why.

If requirements of the SMP were not met, the State/tribe can exercise various enforcement authorities to address the problem. If the fire manager complied with the SMP, the adequacy of the requirements should be reviewed. If air quality data are frequently flagged as resulting from failure of the smoke management components of the burn plan, EPA will call on the State/tribe to work with wildland owners/managers to improve future burn plans and the SMP. When a fire managed for resource benefits breaks out of its fire prescription, and cannot be returned to the prescription, the fire manager will treat it as a wildfire for the purposes of suppression. However, any resulting high PM concentrations must continue to be addressed under this policy, and the data can not be treated as due to a wildfire natural event.

B. Role of the Environmental Protection Agency

1. Impacts with a SMP

If fires managed for resource benefits cause or significantly contribute to violations (see definition) of the daily or annual $PM_{2.5}$ or PM_{10} NAAQS, the State/tribe must submit the following documentation to EPA to avoid a SIP/TIP call or redesignation of the area to nonattainment:

- Evidence supporting the finding that flagged air quality values were due to fires managed for resource benefits,
- Evidence that the fires were subject to a certified State/tribal SMP.

The State/tribe may consider that such fires caused or significantly contributed to violations of the daily NAAQS if 25 percent of all the PM concentrations that are above the level of the daily NAAQS, have been flagged as being due to fire impacts.

The State/tribe may consider that such fires caused or significantly contributed to violations of the annual NAAQS if the sum of the measured concentrations for all days flagged as due to fires, divided by the total number of sample days (fire days plus non-fire days) is greater than or equal to 25 percent of the annual NAAQS (i.e., 4 $\mu g/m^3$ for $PM_{2.5}$ or 12 $\mu g/m^3$ for PM_{10}).

If the evidence is convincing, EPA will exercise its discretion under section 107(d)(3) not to redesignate the area as nonattainment. Rather, following the first NAAQS violation based on 3 calendar years of PM air quality data, EPA will call on the State/tribe to review the effectiveness of the SMP in collaboration with wildland owners/managers and make appropriate improvements to mitigate future air quality impacts. The same procedure will be followed if a second NAAQS violation occurs the following year. If fires cause or significantly contribute to a third consecutive NAAQS violation, EPA will call for the SMP to be made part of the SIP/TIP and be Federally enforceable.[4] If the area was designated nonattainment previously, EPA will also call on the State/tribe to review the effectiveness of the SMP and make appropriate improvements.

2. Impacts Without a SMP

If a certified SMP has not been implemented, EPA will not give special consideration to the high PM concentrations attributed to fires managed for resource benefits that cause or

---

[4]For example, the first violation of the PM_{10} NAAQS may be determined using air quality data for calendar years 1997-1999. Subsequently, 1998-2000 data for the same area could show a second violation, and data for 1999-2001 could identify a third violation for the area.

significantly contribute to: (1) violations of a $PM_{2.5}$ or PM_{10} NAAQS, (2) visibility impairment in mandatory Class I Federal areas, or (3) failure to achieve reasonable progress toward the national visibility goal. Rather, EPA will call for adoption of the basic SMP, described in section VI, as part of the SIP/TIP for PM and visibility. The EPA will also notify the governor of the State or the tribal government that the area should be redesignated as nonattainment. The SMP adopted in response to the SIP/TIP call must require mandatory participation for greater than de minimis fires, must be adopted into the SIP/TIP, and must be Federally enforceable. The SIP/TIP will also have to meet all other CAA requirements applicable to nonattainment areas.

3. Interstate Transport of Smoke

Several key provisions of the CAA address interstate pollutant transport. Section 110(a)(2)(D) provides that a SIP must contain provisions preventing subject sources from contributing significantly to nonattainment problems or interfering with maintenance in any other State. That section also prohibits interference with any SIP required measures under part C to prevent significant deterioration or to protect visibility. Section 169A authorizes EPA to promulgate regulations requiring states that "may reasonably be anticipated to cause or contribute to" visibility impairment in mandatory Class I Federal areas to include in their SIP's measures necessary to eliminate or reduce such impairment. Section 126 provides that, in response to petitions from government entities regarding significant pollutant transport, EPA may prescribe certain corrective measures. Also, sections 169B, 176A and 184 contain provisions for cooperatively addressing interstate pollution problems by establishing interstate transport regions and commissions to address region wide pollution and visibility concerns. The EPA promulgated a final rule, pursuant to the requirements of section 301(d) of the CAA that authorizes eligible Indian tribes to also implement these provisions.[5] If fires managed for resource benefits in one State (or on Indian lands) cause or significantly contribute to NAAQS violations in another State (or on Indian lands), EPA is authorized to take action under section 110(k)(5) of the CAA to address the problem. If, among other things, EPA finds that a SIP/TIP is substantially inadequate to attain or maintain the NAAQS, it may require the SIP/TIP to be revised to correct the

[5]See Volume 63 Federal Register 7254, February 12, 1998.

inadequacy (e.g., transported smoke).

C. Role of Wildland Owners/Managers

Wildland owners/managers are responsible for following State/tribal regulations applicable to fires, obtaining authorization to burn, and following the approved burn plan, when one is required. Owners/managers are responsible for taking appropriate actions to control the fire and reduce exposure to smoke when adverse air quality impacts result from a failure of the air quality prescription or an escaped fire.

There is a special need for fires managed by Federal agencies to have burn plans that include smoke management components. Fires managed by Federal agencies are most likely to impact air quality in recreation areas (national parks, forest, etc.) and impair visibility in mandatory Class I Federal areas. The EPA encourages Federal agencies to include smoke management components in all burn plans, regardless of the existence of a State/tribal SMP.

VIII. DATA ON WILDLAND and PRESCRIBED FIRES

Most of a State/tribal program to protect air quality is contained in a SIP or TIP. Since the use of fire for resource management is expected to increase substantially, especially on Federal lands, State/tribal air quality managers will need information to develop potential annual or seasonal air pollutant emission estimates for SIP/TIP planning. As for any source, emissions from fires can be estimated by multiplying the estimated level of activity by an emission factor. The level of activity for fire is the mass of biomass (fuel) consumed, usually expressed in tons. Emission factors expressed in pounds per ton of fuel consumed are available in EPA's publication AP-42 (which is scheduled to be updated). Emission factors are derived from an estimate of overall combustion efficiency (i.e. stoichiometric ratio). The mass of fuel consumed is the product of fire size (acres), pre-burn fuel loading (tons per acre), and fuel consumption (percent of pre-burn loading). An emission inventory can be compiled by the affected air agency for an individual fire, a statistical class of fires, a burn program, or a population of fires in a given area over a period of time based on this information.

Federal land management agencies currently collect data on wildland and prescribed fires, however, no standard reporting format is followed. These raw data are usually limited to the time and approximate location of the fire, fire perimeter area, weather (occasionally) and a

qualitative description of fuels at the point of ignition. The data are not collected for the purpose of calculating air pollutant emissions and are probably inadequate for that purpose.

A National Interagency Fire Statistics Information Project has been initiated to develop an easily accessible system for storing a set of commonly agreed upon fire data. Post-burn data, such as that described above, on future wildland and prescribed fires would be stored in this database. The database will be accessible by air quality managers to estimate past, current, and future emission trends from this source category.

The EPA encourages the Federal land management agencies to develop the fire statistics database and FLM's to report fire data to the system. These fire data will be needed by air quality managers in regions where most wildland and prescribed fires occur on Federal lands. Air quality managers should request similar fire data for wildland and prescribed fires on State, private and Indian wildlands as well as information on other types of open burning to complete their emission inventories.

Statewide emissions from fire use in all 50 states during 1989 have been estimated based on a survey of [Federal, State and private] land owners/managers. [Ref. Peterson/Ward] Also, a spatially resolved inventory of prescribed burning by county for 1990 and by 50km grid for 1995, 2015 and 2040 was prepared for 10 western States as part of the Grand Canyon Visibility Transport Commission's activities. [Ref. Peterson/Lahm] The emission estimates are based on fuel models derived from 14 types of vegetative cover spatially mapped throughout the area and estimates of fuel loadings as either low, medium or high. The procedures followed by Peterson and Lahm to estimate emissions for the western states provide a good model for developing emissions estimates for other areas, also.

Further information on developing emissions estimates and the data required can be found in the white paper "Emission Inventories for SIP Development." See Section I to obtain a copy.

IX. MEETING OTHER CLEAN AIR ACT REQUIREMENTS

A. Demonstrate Conformity of Federal Activities

Activities on Federal lands must meet the requirements of the CAA, including the provisions of section 176(c), that such activities "conform" to the purpose of the applicable SIP. The EPA's Conformity rules, implementing the provisions of section 176(c), only apply to

Federal actions taken within a nonattainment or maintenance area. The Transportation Conformity rules govern transit-related activities, and all other type of activities are governed by the General Conformity rules. The rules require a Federal agency to demonstrate, prior to initiating a project, that its action conforms to all applicable requirements in a SIP and will not cause or contribute to NAAQS violations. The General Conformity rules provide Federal agencies with several options for demonstrating conformity. The following options are most typically followed : (1) a modeling demonstration to show that emissions from the project will not increase the frequency or severity of a NAAQS violation, (2) obtaining emission reductions that offset the new project emissions, or (3) showing that the project's emissions are already included in, or accommodated by, the emissions inventory of the SIP for the relevant nonattainment or maintenance area. Federal activities occurring on tribal lands will be addressed by EPA consistent with its Tribal Air Rule and the requirements of the CAA.

The above procedures can be followed to demonstrate conformity of fire projects for a Federal land management agency's administrative units based on the FMP's developed for such units. The demonstration can be made on an annual basis for all burns within the airshed of a nonattainment or maintenance area. Alternatively, the demonstration can be made for each individual fire project conducted at the administrative unit.

In addition to the previously cited methods for demonstrating conformity of Federal fire projects, EPA will pursue, in consultation with the other Federal agencies, adding an alternative method to the General Conformity rules through rulemaking. At a minimum, EPA believes that the alternate method should require a Federal agency to document that its fire projects are managed within a certified SMP. The SMP also must require regional coordination (cooperation of all jurisdictions in an airshed) of burn plan authorization and real-time air quality monitoring at sensitive receptors, when warranted, in addition to the basic program components discussed in section VI.

B. Visibility/Regional Haze Requirements

The EPA's visibility regulations (45 FR 80084, December 2, 1980) protect mandatory Class I Federal areas from manmade impairment that is "reasonably attributable" to a single emission source or small group of sources. FLM's for mandatory Class I Federal areas have a key

consultative role and responsibility to participate in the development of SIP's for visibility impairment that is reasonably attributable to specific sources. In Part C of the CAA which includes the visibility protection mandate, Congress assigned FLM's the "affirmative responsibility to protect air quality related values (including visibility)" in mandatory Class I Federal areas. Under EPA's regulations, States must take appropriate actions to address all sources of visibility impairment, including fires, in response to a FLM's certification of reasonably attributable impairment in mandatory Class I Federal areas.

A new regulatory program to protect mandatory Class I Federal areas from "regional haze" impairment was proposed by EPA on July 31, 1997 (62 FR 41137). After the regional haze rules become final, States will need to address the impacts of fires and other contributing sources on meeting reasonable progress in their control strategy analyses, as well as during periodic progress assessments. The EPA will revisit this section of the Air Quality Policy on Wildland and Prescribed Fires after the final rules for implementing the regional haze program have been promulgated. The EPA will also develop guidance on assessing natural background visibility to aid in implementing the regional haze rules, and will consider the following paper at that time. The white paper "Estimating Natural Emissions From Wildland and Prescribed Fire" presents preliminary options for defining natural wildland and prescribed fire emissions that may or may not be consistent with the final regional haze rules. See Section I to obtain a copy.

C. **Prevention of Significant Deterioration**

Title I, part C of the CAA requires SIP's to include provisions to prevent the significant deterioration of air quality in areas designated as attainment or unclassifiable for any NAAQS. "Significant deterioration" for any pollutant is defined as an unacceptable incremental increase in ambient concentrations above the baseline concentration for that pollutant in an area. The PSD "increments" have been established for SO_2, NO_2, and PM_{10}. The EPA adopted NAAQS for $PM_{2.5}$, which became effective on September 16, 1997. However, no increments have yet been promulgated for $PM_{2.5,}$

The SIP's are required to contain emission limits and such other measures as may be necessary to prevent significant deterioration of air quality. See section 161 of the Act. In addition, SIP's are required to include a preconstruction review permit program for new and

modified major stationary sources. See section 165 of the Act. The SIP's must ensure that increases in emissions from all types air pollution sources do not cause the allowable increment for a pollutant to be exceeded.

While fires managed for resource benefits generally are not subject to a preconstruction review and the issuance of a PSD permit, the emissions from such activities may affect the air quality in a PSD area. Under adverse conditions, the combined PM emissions from increased fire activities and from other sources could possibly result in ambient concentrations that exceed the allowable PSD increments for PM. Historically, EPA has often regarded fires managed for resource benefits to be temporary activities.[6] The PM emissions resulting from fire activities differ from the PM emissions generated by most other sources because they are generally short-lived. That is, the burning generally is carried out infrequently at a specific location (once every 5-20 years) and the duration tends to be short (approximately 1-2 days). Even with the proposed increased utilization of fire as a resource management tool, the resulting PM emissions are expected to be relatively uncommon at a particular location and of short duration.

Section 163(c)(1)(C) of the Act authorizes States with approved PSD programs to exclude (with the Administrator's approval) concentrations of PM caused by "construction or other temporary emission-related activities" when determining compliance with the PSD increments. The EPA generally supports the concept of allowing States with approved SIP's to exclude emissions caused by temporary managed fire activities from increment analyses, provided the exclusion does not result in permanent or long-term air quality deterioration. Nevertheless, the decision as to whether PM emissions from fire activities should be counted against the PSD increments for PM is a decision to be made by individual States. The EPA expects States to consider the extent to which a particular type of prescribed burning activity is truly temporary, as opposed to those activities which can be expected to occur in a particular area with some regularity over a period of time.

[6]See Volume 58 Federal Register 31633, June 3, 1993.

DEFINITIONS

Air Quality: The characteristics of the ambient air (all locations accessible to the general public) as indicated by concentrations of the six air pollutants for which national standards have been established [i.e., particulate matter (PM), sulfur dioxide (SO_2), nitrogen dioxide (NO_2), ozone (O_3), carbon monoxide (CO) and lead], and by visibility in mandatory Federal Class I areas. For the purposes of this policy, concentrations of PM are taken as the primary indicators of ambient air quality.

Air Quality Manager: The regulatory body responsible for managing the air quality protection program for a State, local or tribal government.

Air Quality Related Values (AQRV): Those special attributes of a mandatory Class I Federal area that deterioration of air quality may adversely affect. Some examples of AQRV include: flora and fauna, water, visibility, and odor among others.

Ambient Air: That portion of the atmosphere, external to buildings, to which the general public has access.

Administrative Unit: A unit of land (Forest, Refuge, Park, etc.) under the administration of a public land management agency.

AP-42: The Environmental Protection Agency's (EPA) Compilation of Air Pollutant Emission Factors for stationary point, area, and mobile sources. An emission factor is a representative value that attempts to relate the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant. Emission factors are then used to estimate the magnitude of a source's pollutant emissions.

The plan includes the project objective, fire prescription (including smoke management components), personnel, organization, equipment, etc.

Class I Area: An area set aside under the Clean Air Act (CAA) to receive the most stringent protection from air quality degradation. Mandatory Class I Federal areas are (1) international parks, (2) national wilderness areas which exceed 5,000 acres in size, (3) national memorial parks which exceed 5,000 acres in size, and (4) national parks which exceed 6,000 acres and were in existence prior to the 1977 CAA Amendments. The extent of a mandatory Class I Federal area includes subsequent changes in boundaries, such as park expansions.

De Minimis Fires: Fires that will cover fewer than X acres or consume less than Y tons of fuel, as established by a State or tribe.

Federal Implementation Plan (FIP): A plan (or portion thereof) promulgated by the Administrator, as provided for under the CAA and any applicable EPA regulations, including regulations governing tribal air plans, to fill all or a portion of a gap or otherwise correct all or a portion of an inadequacy in a State or tribal implementation plan (TIP), and which may include enforceable emission limitations or other control measures, means or techniques (including economic incentives, such as marketable permits or auctions of emissions allowances), and provides for attainment of the relevant national ambient air quality standard (NAAQS).

Federal Land Manager (FLM): With respect to any lands in the United States, the Secretary of the Federal department with authority over such lands. Generally, the Secretaries delegate their authority to specific elements within each department. For example, the National Park Service and the Fish and Wildlife Service manage those areas under the authority of the Department of the Interior.

Fire Dependent Ecosystem: A community of plants and animals that must experience recurring disturbances by fire, in order to sustain its natural plant succession, structure and composition of vegetation, and maintain appropriate fuel loading and nutrient cycling to ensure proper ecosystem function.

Fire Management Plan (FMP): A strategic plan that defines a program to manage wildland and prescribed fires, and documents the FMP to meet management objectives outlined in the approved land use plan. The plan is supplemented by operational procedures such as preparedness plans, burn plans and prevention plans.

Fuel: Includes combustible vegetative matter such as grass, trees, shrubs, limbs, branches, duff, and stumps.

Indian Land: Indian land in this document refers to Indian country which is (a) all land within the limits of any Indian reservation under the jurisdiction of the United States Government, notwithstanding the issuance of any patent, and, including rights-of-way running through the reservation, (b) all dependent Indian communities within the borders of the United States whether within the original or subsequently acquired territory thereof, and whether within or without the

limits of a state, and (c) all Indian allotments, the Indian titles to which have not been extinguished, including rights-of-way running through the same. [See 18 U.S.C. 1151.]

Land Use Plan: A broad scale, long range plan (e.g., forest plan, refuge plan or resource management plan) that identifies the scope of actions and goals for the land and resources administered by a land owner/manager.

National Ambient Air Quality Standards (NAAQS): Standards for maximum acceptable concentrations of pollutants in the ambient air to protect public health with an adequate margin of safety, and to protect public welfare from any known or anticipated adverse effects of such pollutants (e.g., visibility impairment, soiling, materials damage, etc.) in the ambient air.

National Environmental Policy Act (NEPA): Establishes procedures that Federal agencies must follow in making decisions on Federal actions which may impact the environment. Procedures include evaluation of environmental effects of proposed actions, and alternatives to proposed actions; involvement of the public and cooperating agencies.

Nuisance Smoke: Amounts of smoke in the ambient air which interfere with a right or privilege common to members of the public, including the use or enjoyment of public or private resources.

Particulate Matter (PM): Any airborne finely divided material, except uncombined water, which exists as a solid or liquid at standard conditions (e.g., dust, smoke, mist, fumes, or smog).

$PM_{2.5}$: Particles with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers.

PM_{10}: Particles with an aerodynamic diameter less than or equal to a nominal 10 micrometers (including $PM_{2.5}$).

Prescribed Fire: Any fire ignited by management actions to meet specific objectives (i.e., managed to achieve resource benefits).

Prescription: Measurable criteria which guide selection of appropriate management response and actions. Prescription criteria may include the meteorological conditions affecting the area under prescription, as well as factors related to the state of the area to be burned such as

the fuel moisture condition and other physical parameters. Other criteria which may be considered include safety, economic, public health, environmental, geographic, administrative, social or legal considerations, and ecological and land use objectives.

Prevention of Significant Deterioration (PSD): A requirement in the CAA, which establishes the maximum allowable increases in ambient air concentrations of selected air pollutants above baseline concentrations in areas designated as Class I, Class II, or Class III.

Project Plan: A strategic plan for accomplishing specific actions and goals (objectives) established in a land use plan. A project may include several activities such as cutting and hauling trees and shrubs, planting trees, building trails, and fire treatment.

Regional Haze: Generally, concentrations of fine particles in the atmosphere extending up to hundreds of miles across a region and promoting noticeably hazy conditions; wide-spread visibility impairment, especially in mandatory Class I Federal areas where visibility is an important value.

Sensitive Receptors: Population centers such as towns and villages, camp grounds and trails, hospitals, nursing homes, schools, roads, airports, mandatory Class I Federal areas, etc. where smoke and air pollutants can adversely affect public health, safety and welfare.

Smoke Management Program (SMP): Establishes a basic framework of procedures and requirements for managing smoke from fires that are managed for resource benefits. The purposes of SMP's are to mitigate the nuisance and public safety hazards (e.g., on roadways and at airports) posed by smoke intrusions into populated areas; to prevent deterioration of air quality and NAAQS violations; and to address visibility impacts in mandatory Class I Federal areas in accordance with the regional haze rules.

State Implementation Plan (SIP): A CAA required document in which States adopt emission reduction measures necessary to attain and maintain NAAQS, and meet other requirements of the Act.

Suppression: A management action intended to protect identified values from a fire, extinguish a fire, or alter a fire's direction of spread.

Tribal Implementation Plan (TIP): A document authorized by the CAA in which eligible tribes adopt emission reduction measures necessary to attain and maintain NAAQS, and

meet other requirements of the CAA for lands within tribal jurisdictions.

Violation of the PM NAAQS: As revised in 1997, the daily PM_{10} standard is violated when the 99th percentile of the distribution of 24-hour concentrations for a period of 1 year (averaged over 3 calendar years) exceeds 150 $\mu g/m^3$ at any monitor within an area. The annual PM_{10} standard is violated when the arithmetic average of 24-hour concentrations for a period of 1 year (averaged over 3 calendar years) exceeds 50 $\mu g/m^3$ at any monitor within an area.

The new NAAQS levels for $PM_{2.5}$ are set at a daily concentration less than or equal to 65 $\mu g/m^3$, and an annual mean concentration of less than or equal to 15 $\mu g/m^3$. The daily standard is violated when the 98th percentile of the distribution of the 24-hour concentrations for a period of 1 year (averaged over 3 calendar years) exceeds 65 $\mu g/m^3$ at any monitor within an area. The annual standard is violated when the annual arithmetic mean of the 24-hour concentrations from a network of one or more population-oriented monitors (averaged over 3 calendar years) exceeds 15 $\mu g/m^3$. Compliance with the annual $PM_{2.5}$ NAAQS is based on population-oriented monitors because the health information, upon which the standard is based, relates area-wide health statistics to area-wide air quality as measured by one or more monitors.

Volatile Organic Compounds (VOC): Any organic compound which participates in atmospheric photochemical reactions, which are measured by a reference method, an equivalent method, or an alternative method. Some compounds are specifically listed as exempt due to their having negligible photochemical reactivity. [See 40 CFR 51.100.] Photochemical reactions of VOC's with oxides of nitrogen and sulfur can produce O_3 and PM.

Wildfire: An unwanted wildland fire.

Wildland: An area where development is generally limited to roads, railroads, power lines, and widely scattered structures. The land is not cultivated (i.e., the soil is disturbed less frequently than once in 10 years), is not fallow, and is not in the United States Department of Agriculture (USDA) Conservation Reserve Program. The land may be neglected altogether or managed for such purposes as wood or forage production, wildlife, recreation, wetlands or protective plant cover. **[The distinction between wildlands, to which the recommendations in this document apply, and agricultural lands is subject to further discussion.]**

Wildland Fire: Any non-structural fire, other than prescribed fire, that occurs in the

wildland. Note: Wildland fires include unwanted (wild) fires and naturally ignited fires that are managed within a prescription to achieve resource benefits.

Wildland Fire Situation Analysis (WFSA): A real time decision-making process carried out by federal land management agencies to select an appropriate management response to wildland fire. The WFSA considers fire fighter and public safety, risk to property and resources, fire fighting resources available, land management objectives and environmental, social economic and political constraints. The environmental and social constraints considered include, among other things, how air quality and/or visibility will be affected at sensitive receptors by each alternative fire management strategy.

Wildland/Urban Interface: The line, area or zone where structures and other human development meets or intermingles with the wildland.

Foreword

"Interagency Prescribed Fire Planning and Implementation Procedures Reference Guide" (2006 Guide) provides standardized procedures, specifically associated with the planning and implementation of prescribed fire. These procedures meet all policy requirements described in the 2003 ***Interagency Strategy for the Implementation of Federal Wildland Fire Management Policy.*** The 2006 guide provides unified direction and guidance for prescribed fire planning and implementation for the Department of the Interior's Bureau of Indian Affairs (BIA), Bureau of Land Management (BLM), the National Park Service (NPS), the United States Fish and Wildlife Service (USFWS) and the United States Department of Agriculture Forest Service (USDA FS).

Prior to implementing Prescribed Fire under the standards in the 2006 Guide, local units must have ensured compliance with National Environmental Policy Act (NEPA), National Historical Preservation Act (NHPA) and Endangered Species Act (ESA) requirements.

This Implementation Procedures Reference Guide (2006 Guide) meets requirements of National Fire and Aviation Executive Board (NFAEB) task to develop common language and unified direction or guidance for agency/bureau manuals, directive handbooks, and guidelines to complete final implementation of this policy.

Executive Summary

Fire is an essential ecological process in many fire dependent ecosystems. In large areas of the country, fire exclusion from these ecosystems has led to unhealthy forest, woodland and rangeland conditions. These areas are at risk of intense, severe wildfires that threaten communities and cause significant damage to key ecological components.

As one component of fire management, prescribed fire is used to alter, maintain, or restore vegetative communities; achieve desired resource conditions; and to protect life, property, and values that would be degraded and/or destroyed by wildfire.

Federal Prescribed Fire Programs are guided by the principles of the 1995 Federal Wildland Fire Management Policy and Program Review and the 2001 update. Collectively these principles establish that wildfire suppression, wildland fire use, and prescribed fire programs be implemented equally, consistently and concurrently, as a means to avoid fire risks. The policy emphasizes firefighter safety as a consideration in planning and a priority in operations (Wildland Fire Management Policy, June, 2003).

This guide supports the Interagency Strategy for the Implementation of Federal Wildland Fire Management Policy. It provides unified direction and guidance for prescribed fire planning and implementation for the Department of the Interior's Bureau of Indian Affairs (BIA), Bureau of Land Management (BLM), the National Park Service (NPS), the United States Fish and Wildlife Service (USFWS) and the United States Department of Agriculture Forest Service (USDA FS).

This guide partially replaces the original Wildland and Prescribed Fire Management Policy Implementation Procedures and Reference Guide (USDI/ USDA 1998)[1] which established consistent agreement between agencies regarding federal policy direction related to prescribed fire planning and implementation.

Contents

Introduction

Purpose

The purpose of this guide is to provide consistent interagency policy, establish common terms and definitions and identify planning and implementation processes for prescribed fire.

The guide describes what is **minimally** acceptable for prescribed fire planning and implementation. Agencies may choose to provide more restrictive standards and policy direction, but must adhere to these **minimums**.

Scope

This guide provides policy and direction to implement existing federal policy and has been developed with tribal, state, county, and local cooperators in mind. While some of these guidelines will not fit all non-federal cooperators, the intent is to include everyone by establishing a planning and implementation guide that might result in that outcome.

Prescribed Fire Program Goals

Interagency Prescribed Fire Program goals are to:

- Provide for firefighter and public safety as the first priority.
- Ensure that risk management is incorporated into all prescribed fire planning and implementation.
- Use prescribed fire in a safe, carefully planned, and cost-efficient manner.
- Reduce wildfire risk to communities, municipal watersheds and other values and to benefit, protect, maintain, sustain, and enhance natural and cultural resources.
- Utilize prescribed fire to restore natural ecological processes and functions, and to achieve land management objectives.

Authorities

All use of prescribed fire will be supported by a Land/Resource Management Plan (L/RMP) and/or Fire Management Plans (FMP). Prescribed fire projects can only be implemented through an approved Prescribed Fire Plan. Specific authorities exist for each agency to utilize prescribed fire (See Appendix A). All project decisions to use prescribed fire are subject to the agency's analysis, documentation, and disclosure requirements for complying with the National Environmental Policy Act (NEPA).

During prescribed fire planning and operations, all federal agencies will accept each other's standards for qualifications. The minimum qualifications standard is National Wildland Fire Coordinating Group (NWCG) Wildland and Prescribed Fire Qualifications System Guide, 2000 (PMS 310-1). State, local cooperators and contractors working on federal agency prescribed fires must meet the NWCG PMS 310-1 standards unless local agreements specify otherwise.

The main reference glossary for this guide is the NWCG glossary, which is updated periodically: http://www.nwcg.gov/.

This guide is not intended to address interagency business rules. Reference individual agency's business rules for direction.

Prescribed Fire Planning Process

Common planning documents to ensure quality prescribed fire plans include:

Land/Resource Management Plan (L/RMP)

Overall direction is provided to the Wildland Fire Management Program by Land/Resource Management Plans (L/RMP). These plans serve as the document to initiate, analyze, and provide the basis for using prescribed fire to meet resource management objectives.

Fire Management Plan (FMP)

All burnable acres will be covered by a Fire Management Plan (FMP). The FMP is the cornerstone plan for managing a Wildland Fire Management Program and should flow directly from the L/RMP. FMPs may be developed for a Fire Planning Unit (FPU) that crosses jurisdictional boundaries. Where the Wildland Fire Management Program crosses jurisdictional boundaries, or where

program coordination is essential, the FMP will require interagency coordination. Most FMPs are anticipated to fall into this category.

National Environmental Policy Act (NEPA)

Resource and prescribed fire objectives for specific prescribed fire projects are derived from the NEPA analysis. **The entire prescribed fire project area must be analyzed under NEPA.** NEPA documents that identify and analyze the effects of using or not using prescribed fire treatment projects may include Environmental Impact Statements (EIS), Environmental Assessments (EA), and Categorical Exclusion (CE).

Other authorities that may be utilized to guide analysis and determination of NEPA compliance are Healthy Forest Restoration Act (HFRA), Healthy Forest Initiative (HFI), and the Tribal Forest Protection Act (TFPA).

Prescribed fire planning and related NEPA analysis should always occur at the largest possible spatial and temporal scales.

Implementation Organization and Qualifications

During prescribed fire planning and operations, all federal agencies will accept each other's standards for qualifications. The minimum qualifications standard is National Wildland Fire Coordinating Group (NWCG) Wildland and Prescribed Fire Qualifications System Guide, 2000 (PMS 310-1). State, local cooperators and contractors working on federal agency prescribed fires must meet the NWCG PMS 310-1 standards unless local agreements specify otherwise. No less than the organization described in the approved Prescribed Fire Plan may be used for implementation. The complexity of each prescribed fire or phase of fire(s) determines the organization(s) needed to safely achieve the objectives specified in the Prescribed Fire Plan.

Minimum Supervisory Qualifications determined by prescribed fire complexity:

Table 1. Qualifications requirements related to Prescribed Fire Complexity.

	Complexity		
Position	**High**	**Moderate-Low**	**Low**
RXM1	Optional	Optional	Optional
RXM2	Not Allowed	Optional	Optional
RXB1	Required	Optional	Optional
RXB2	Not Allowed	Required	Optional
RXB3	Not Allowed	Not Allowed	Required
FIRB	Optional	Optional	Optional
Holding Specialist: Holding functions will be managed by personnel qualified at the appropriate ICS wildland fire operations position as required by complexity, assigned resources and operational span of control. For some projects, there may be no holding requirements or the holding duties are assumed by the Burn Boss.			

High, Moderate, and Low complexity prescribed fires are determined through the required NWCG Prescribed Fire Complexity Rating System Guide.

Prescribed Fire Burn Boss Type 3 (RXB3):

Adoption of the RXB3 position is up to each agency. Non-federal RXB3s must meet the qualifications as listed in the table below unless local agreements specify otherwise.

An RXB3 will only be allowed to implement low complexity prescribed fires where the possibility of spread or spotting outside the project area is negligible to non-existent; multiple fuel models are not involved and aerial operations are not involved;.

The requirements for Prescribed Fire Burn Boss Type 3 are:

Table 2. Requirements for Prescribed Fire Burn Boss Type 3

Training:	Required: S-290 Intermediate Wildland Fire Behavior Suggested: S-234 Ignition Operations
Prerequisite Experience:	Incident Commander, Type 5 **OR** Advanced Firefighter/Squad Boss **AND** Satisfactory position performance as a Prescribed Fire Burn Boss Type 3
Physical Fitness:	Moderate
Other Position Assignments that will Maintain Currency:	Prescribed Fire Burn Boss Type 2 Prescribed Fire Burn Boss Type 1 Fire Use Manager Prescribed Fire Manager Type 1 Prescribed Fire Manager Type 2

Responsibilities

Prior to prescribed fire implementation, thorough planning and review processes must be conducted. All prescribed fire actions must be developed from resource/fire management objectives carried forward from FMP's and L/RMP's. A specific implementation plan for each prescribed fire must be completed, reviewed, and approved before ignition can begin.

The Agency Administrator has final approval authority for all Prescribed Fire Plans, unless special circumstances warrant higher review and concurrence (such as may occur during higher Preparedness Levels or for extremely large, complex projects). Although the Agency Administrator has final approval authority for the Prescribed Fire Plan and the Agency Administrator Pre-Ignition Approval checklist, the Prescribed Fire Burn Boss has the responsibility to make the on-site tactical "GO/NO-GO" decision. The Prescribed Fire Burn Boss ensures that all prescription, staffing, equipment, and other plan specifications are met before, during, and after the prescribed fire.

Every Prescribed Fire Plan must receive a technical review. The Technical Reviewer and Prescribed Fire Plan Preparer must be qualified or have been previously qualified as a Prescribed Fire Burn Boss at an experience level equal to or higher than the complexity being reviewed. Either **the Prescribed Fire Plan Preparer or Technical Reviewer must be currently qualified.**

Only a RXB1 can review plans at high complexity. An RXB2 can review plans of moderate to low complexity. An RXB3 is not allowed to function as a Prescribed Fire Plan Preparer (see Chapter 3, section C.) or Technical Reviewer.

Agency or individual unit policy may dictate additional reviews. Interagency Prescribed Fire Plans require approval from all appropriate Agency Administrators and a technical review. Listed below are the prescribed fire and implementation position roles and responsibilities:

Agency Administrator

For the purposes of this document, the Agency Administrator is defined as the Line Officer (or designee) of the agency or jurisdiction that has responsibility for the prescribed fire. These usually include the: NPS Park Superintendent, BIA Agency Superintendent, USFS Forest Supervisor, BLM District/Field Office Manager, FWS Project Leader, State Forest Officer, and/or Fire Chief.

The Agency Administrator is responsible to:

1. Approve Prescribed Fire Plans. When approving a plan, understand the risks associated with it. Ensure that the plan has been reviewed and recommended for approval by the Technical Reviewer who was not the primary preparer of the plan.
2. Ensure that only trained and qualified personnel participate in the implementation portion of the prescribed fire.
3. Ensure that projects are monitored, evaluated, and documented in the project file.
4. Sign, date, and provide an expiration date for the approval to burn on the Agency Administrator Pre-Ignition Approval Checklist (Reference Burn Plan Template, Appendix B).
5. Understand and approve the Complexity Analysis (PMS 424 January 2004).
6. Ensure that all prescribed fires are conducted in accordance with the approved implementation plan and established standards and guidelines.
7. Ensure that periodic reviews and inspections of the Prescribed Fire Program are completed.
8. Determine if and when the Agency Administrator is to be notified that contingency actions are being taken.
9. Report all wildfires resulting from prescribed fires through the chain of command.

10. Declare an escaped prescribed fire a wildfire (if responsibility is assigned in the plan).
11. Ensure that escaped prescribed fires are reviewed according to established guidelines.

Technical Reviewer

The Technical Reviewer is responsible for reviewing each Prescribed Fire Plan element for content as well as evaluating the risk and Complexity Analysis to ensure that the stated goals and objectives can be safely and successfully achieved when properly implemented. The Technical Reviewer shall be qualified or previously qualified as a Burn Boss at or above the level of project complexity. At a minimum, NWCG qualifications will be accepted. The Technical Reviewer should have local knowledge of the area, experience burning in similar fuel types, and/or conduct an on-site review. **The Technical Reviewer must be someone other than the primary preparer of the plan.** An off-unit technical review is encouraged to provide an additional independent perspective. It is acceptable for other specialists to review certain portions of the plan however; a primary Technical Reviewer must be designated as technical review signatory. For example, a fire behavior analyst may review the fire behavior calculations; the aviation manager may review the air operations plan; and/or a resource specialist may review impacts to their resource of interests. It is recommended that at least once every year, each unit should send a moderate or high complexity Prescribed Fire Plan off-unit for technical review.

The Technical Reviewer is responsible to:

1. Ensure that Prescribed Fire Plans meet agency policy and direction.
2. Ensure that the Complexity Analysis accurately represents the project, so the Agency Administrator understands the identified risks and the mitigating measures enacted. This may require on-site review in Wildland Urban Interface (WUI) or high complexity situations by the Technical Reviewer.
3. Check the prescription parameters against the fuel types to ensure that the project as planned has a reasonable chance of meeting the resource management objectives.
4. Ensure that the fire behavior calculations and/or prescription parameters are appropriate and within the acceptable range.
5. Ensure that the ignition, holding and contingency plans are consistent with the predicted fire behavior.
6. Complete and sign the Technical Review Checklist (See Burn Plan Template, Appendix B) and the Prescribed Fire Plan signature page.

Prescribed Fire Plan Preparer

For the purpose of this document, the Prescribed Fire Plan Preparer is defined as the individual responsible for the preparation of the Prescribed Fire Plan. Several people may be involved in the preparation of the Prescribed Fire Plan, but the Prescribed Fire Plan Preparer is responsible for the final plan content. The primary preparer of the Prescribed Fire Plan will sign the signature page.

The preparer is responsible to:

1. Prepare the Prescribed Fire Plan in accordance with this guide's policy and direction.
2. Coordinate with the resource management and/or technical specialists to ensure that the plan meets management and operational objectives.
3. Interact with the Technical Reviewer to ensure that all plan elements are adequately addressed.
4. Complete and sign the Complexity Analysis.

Prescribed Fire Burn Boss (RXB1/RXB2/RXB3)

The Prescribed Fire Burn Boss is responsible to the Agency Administrator, Prescribed Fire Manager, or FMO/local fire management organization for implementing the Prescribed Fire Plan.

The Prescribed Fire Burn Boss is responsible to:

1. Review the Prescribed Fire Plan prior to implementation and ensure all required elements and objectives are addressed.
2. Inspect the burn unit to validate Prescribed Fire Plan elements including areas of special concern as well ensuring that holding/contingency plans adequately address expected fire behavior outside the unit(s).
3. Obtain current weather and smoke management forecasts, updates, and special advisories from a meteorologist.
4. Maintain communication with the Agency Administrator, Prescribed Fire Manager, or FMO/local fire management organization.
5. Ensure that the Agency Administrator Pre-Ignition Approval Checklist is valid (See Burn Plan Template, Appendix B)
6. Take to the field those portions of the Prescribed Fire Plan necessary for completing the briefing and safe project implementation.
7. Complete and sign the Prescribed Fire GO/NO-GO Checklist (See Burn Plan Template, Appendix B).
8. Ensure availability of any contingency resources and management of those resources if deployed.
9. Ensure that all operations are conducted in a safe manner and in accordance with the approved plan and established standards and guidelines.
10. Verify qualifications of all assigned personnel. Conduct the personnel/safety briefing to ensure a safe operation.
11. Conduct the test fire and document the results.
12. Supervise assigned personnel and direct the ignition, holding and monitoring operations. The Prescribed Fire Burn Boss will be responsible for implementation including mop-up and patrol unless otherwise assigned to other qualified personnel.
13. Declare the prescribed fire out unless the responsibility for it is formally passed to another Prescribed Fire Burn Boss, Prescribed Fire Manager or the local fire management organization.
14. Determine when the prescribed fire is not within prescription parameters (both short and long term) or is not meeting objectives.
15. Declare an escaped prescribed fire a wildfire (if responsibility is assigned in the plan).
16. Manage the incident or oversee the transition to another Incident Commander if an escape occurs.
17. Ensure that reports are completed.
18. Coordinate with adjacent landowners, cooperators and permittees as designated in the Prescribed Fire Plan.

Fire Management Officer (FMO)/ Fire Program Manager

The Fire Management Officer (FMO)/Fire Program Manager is responsible to the Agency Administrator for planning, implementing and monitoring of the Prescribed Fire Program in accordance with policy and direction.

The FMO/Fire Program Manager is responsible to:

1. Ensure compliance with National, Regional, tribal and local fire policy and direction, as well as applicable state and local laws.
2. Ensure that Preparedness Level Restrictions are adhered to. At National Preparedness Levels Four and Five, prescribed fire implementation is restricted. See the National Interagency Mobilization Guide for details.
3. Ensure that both the Prescribed Fire Plan Preparer and the Technical Reviewer are qualified or qualified less currency at the level of complexity or higher.
4. Ensure that trained and qualified personnel are available to participate in the Prescribed Fire Program.
5. Assign the Prescribed Fire Burn Boss.
6. Ensure a Prescribed Fire Plan with written approval exists for each prescribed fire project.
7. Review the Prescribed Fire Plan to assess the impact of the project on the unit's workload; include the project in the unit's Annual Work Plan; assess the unit's

ability to implement the project; and assess the need for additional implementation resources.

8. Ensure that all prescribed fires are conducted in accordance with the approved Prescribed Fire Plan and established standards and guidelines.
9. Declare an escaped prescribed fire a wildfire (if responsibility is assigned in the plan).
10. Act as liaison/coordinator to the Agency Administrator, Prescribed Fire Manager and/or Prescribed Fire Burn Boss, local dispatch office, other units, other agencies, air quality authorities, news media, transportation agencies, and safety officials.
11. Ensure that projects are reported through the local office and comply with national reporting guidelines.
12. Ensure that fuels management projects and interagency support actions are reported through the proper reporting systems.
13. Ensure that periodic reviews and inspections of the Prescribed Fire Program are completed.
14. Update Agency Administrator on the progress of the prescribed fire (as necessary).
15. Ensure that projects are monitored, evaluated and documented as a part of the project file.

Prescribed Fire Manager (RXM1/RXM2)

The Prescribed Fire Manager is responsible for implementing and coordinating assigned prescribed fire activities. A Prescribed Fire Manager may be assigned during periods when multiple simultaneous prescribed fires are being conducted; when multiple prescribed fires will be conducted within a short time frame; or where there is complex interagency involvement.

The Prescribed Fire Manager is responsible to:

1. Review Prescribed Fire Plans prior to implementation.
2. Monitor all prescribed fire operations.
3. Ensure that all operations are conducted in a safe manner and in accordance with the approved plan(s) and established standards and guidelines.
4. Act as coordinator/liaison between the burn organization(s) and other offices, agencies, air quality authorities, news media, transportation agencies, safety officials, and interested public.
5. Declare an escaped prescribed fire a wildfire (if responsibility is assigned in the plan).
6. Obtain and interpret long-term weather information.
7. Brief the Burn Bosses and direct operational assignments according to policies, priorities and standards.
8. Set priorities for allocation of resources.
9. Ensure the completion of all required documentation including the evaluation and documentation of accomplishments, fire behavior and fire effects, operation procedures, and cost summaries.

Firing Boss (FIRB)

The Firing Boss reports to the Prescribed Fire Burn Boss and is responsible for supervising and directing ground and/or aerial ignition operations according to established standards in the Prescribed Fire Plan.

The Firing Boss is responsible to:

1. Review the Prescribed Fire Plan and the burn unit prior to implementation.
2. Brief personnel on project objectives and ignition operations.
3. Complete the test fire according to the ignition plan at the direction of the Prescribed Fire Burn Boss.
4. Conduct ignition operations in a safe manner according to the ignition plan.
5. Identify the impacts of ignition on the control and desired fire effects.
6. Coordinate ignition operations with the Holding Specialist.

Holding Specialist

The supervisory position in charge of the holding forces reports to the Prescribed Fire Burn Boss. There is no specific NWCG approved prescribed fire position for this function. This position is assigned by name and title using PMS 310-1 mnemonics. Holding functions will be managed by personnel qualified at the appropriate Incident Command System (ICS) wildland fire operations standard and as required by the prescribed fire complexity, assigned resources, and operational span of control.

The Holding Specialist is responsible to:

1. Review the Prescribed Fire Plan and the burn unit prior to implementation.
2. Brief holding personnel on project objectives and holding operations.
3. Conduct holding operations in a safe manner according to the holding plan.
4. Coordinate holding operations with the Firing Boss.
5. Confine the fire to a predetermined area, mop up, and patrol.
6. Maintain communication with Burn Boss on holding progress and/or problems.

For some prescribed fires, there may be no holding requirements or the holding duties are assumed by the Prescribed Fire Burn Boss.

Fire Effects Monitor (FEMO)

The Fire Effects Monitor (FEMO) is responsible for collecting the onsite weather, fire behavior, and fire effects information needed to assess whether the fire is achieving established resource management objectives.

The FEMO is responsible to:

1. Review the monitoring plan prior to implementation.
2. Monitor, obtain, and record weather data.
3. Monitor and record fire behavior data throughout the burn operations.
4. Recon the burn unit/area assigned.
5. Plot the burn area and perimeter on a map.
6. Monitor and record smoke management information.
7. Monitor first order fire effects.
8. Provide monitoring summary of the fire.
9. Provide fire behavior and weather information to burn personnel as appropriate.

Helitorch Manager (HTMG)

The Helitorch Manager is responsible to manage the helitorch operation, supervise the mixing operation, and provide technical assistance to the Prescribed Fire Burn Boss/Ignition Specialist. The HTMG may also serve as Helicopter Manager and Helitorch Manager or Helicopter Parking Tender (but not both).

Plastic Sphere Dispenser Operator (PLDO)

The Plastic Sphere Dispenser Operator (PLDO) is responsible for the preparation, operation, maintenance, and care of the dispenser. The PLDO reports to the Ignition Specialist.

Helitorch Mixmaster (HTMM)

The Helitorch Mixmaster (HTMM) is responsible for supervising the mixing/filling operations. The HTMM may also serve as Helitorch Manager or Helicopter Manager.

Resource Specialist or Resource Advisor (READ)

The Resource Specialist/READ is responsible for ensuring the prescribed fire project is planned and implemented in a manner supporting the unit's resource management goals and objectives. The Resource Specialist/READ is responsible to the Agency Administrator.

The Resource Specialist/READ is responsible to:

1. Ensure resource management representation in the preparation of the Prescribed Fire Plan.
2. Ensure a review of Prescribed Fire Plans is conducted before each plan is submitted for approval.
3. Evaluate the prescribed fire project in terms of meeting objectives..
4. Provide resource information and direction to the Prescribed Fire Burn Boss.

5. Present information at briefings on resources, priorities, and issues of concern.
6. Coordinate with adjacent landowners, cooperators and permittees as designated in Prescribed Fire plan or by Burn Boss.

Amendments

There may be a need to make amendments to the Prescribed Fire Plan. These are changes to the Prescribed Fire Plan that require Agency Administrator signature. When changes are necessary, plans must be amended to identify the affected sections; the reason for the change(s); and have the changes clearly identified. For amendments, the same standards for Prescribed Fire Plan preparation, review, and approval apply.

Common reasons for amending the Prescribed Fire Plan may include:

- Changes to objectives.
- Changes to complexity.
- Changes to fire behavior prescription parameters.
- Changes to project area boundaries resulting in either an increase or decrease in area.
- Reduction in resource capabilities identified as required in the plan.
- Major changes to ignition methods including ground ignition to aerial ignition; aerial ignition to hand ignition; hand drip torch ignition to use of terra torch ignition (includes ATV mounted ignition devices); and/or hand ignition from roadways to hand ignition from boats or other watercraft.

To avoid having to amend the Prescribed Fire Plan, flexibility should be built into the plan that will allow for a range of adjustments during the prescribed fire. When building flexibility, the range of identified options must remain within the scope of the Complexity Analysis.

Examples of flexibility that can be built into a prescribed fire plan:

- The Prescribed Fire Plan may state that on burn day and subsequent days of the prescribed fire, a mix of the number and kinds of hand crews and engines may be modified as long as stated production capabilities are not compromised.
- As the prescribed fire progresses from ignition to holding to mop up and patrol, specified capabilities and/or types of resources may be adjusted. If these flexibilities are built into the Prescribed Fire Plan, there must be a clear statement as to the work capability requirements of the resources at the various stages of the prescribed fire.
- Minor changes in burn unit boundaries to facilitate holding and/or ignition, as long as the area in question has been in the NEPA document, requires no change in holding or ignition resources and is within the project boundaries.
- Additional resources may be assigned to the project without amending the burn plan if the addition of these resources does not change the complexity of the burn or require additional supervisory positions. These changes must be documented in the daily briefing.

Safety

The Federal Wildland Fire Policy states that firefighter and public safety is first priority. Prescribed Fire Plans and activities must reflect this commitment. Every person involved in a prescribed fire is responsible for identifying safety issues and concerns. It is the responsibility of each individual participating in prescribed fire activities to notify immediate supervisor of any possible misunderstanding of assigned tasks or safety concerns related to the assignment.

NWCG established Work/Rest Guidelines and span of control apply equally to wildland and prescribed fire operations. The management of crew, overhead, and support personnel rest to assure safe, productive fire operations is the responsibility of all supervisory fire management personnel (refer to *NWCG Interagency Incident Business Management Handbook*, PMS 902, NFES 3139).

Exposure to smoke during prescribed fire operations can be a significant safety concern. Research has shown that exposure to smoke on prescribed fires, especially in holding and ignition positions, often exceeds that on wildfire. At a minimum, smoke exposure must be addressed in the Job Hazard Analysis (JHA) and smoke management element. Public safety impacts from smoke should be addressed in the Smoke Management and Air Quality Element as well as the Public, Personnel Safety, Medical Element.

Transportation and use of any product containing chemicals (drip torch fuel, aviation gas, sphere dispensers, fusees, fuel thickener, etc.) must be in compliance with the Occupational Safety and Health Administration's (OSHA) Hazard Communication Standard (29 CFR 1910.1200) and Department of Transportation Regulations (49 CFR Part 171), and agency specific guidance. Material Safety Data Sheets (MSDS) for hazardous materials used on projects should be consulted in developing the JHA.

The SAFENET form and process is designed for reporting and correcting unsafe situations and is applicable to prescribed fire applications.

The risk management process identified in the NWCG Incident Response Pocket Guide (IRPG, PMS 410-1) helps ensure that critical factors and risks associated with prescribed fire operations are considered during decision making. This process should be applied to all prescribed fire planning and operations.

Consider using a Safety Officer on high complexity prescribed fires and others where the complexity analysis shows the need or indicates a higher than normal hazard.

A qualified Safety Officer is defined as a currently qualified Safety Officer, at any Type level (Types 1, 2 or 3), as defined by the NWCG, *Wildland and Prescribed Fire Qualification System Guide* (PMS 310-1).

Prescribed Fire Plan

The Prescribed Fire Plan is the site-specific implementation document. It is a legal document that provides the Agency Administrator the information needed to approve the plan and the Prescribed Fire Burn Boss with all the information needed to implement the prescribed fire. Prescribed fire projects must be implemented in compliance with the written plan.

Prescribed Fire Plans will vary in their degree of detail. The size and complexity of the prescribed fire project will determine the level of detail required. The Prescribed Fire Plan Template (Appendix B) must be utilized. Each element must be addressed and then assembled in the sequence identified in the template. Should an element not apply to a specific prescribed fire plan, not applicable (N/A) may be utilized. Programmatic plans for multiple units under like conditions may be appropriate. Additional information may be added as appendices.

If an interagency mixed ownership Prescribed Fire Plan is being prepared, the development of all appropriate elements within the plan will be conducted in an interagency setting. Interagency agreements and Memorandums of Understanding (MOU) and/or private land owner agreements are required to implement prescribed fire on multiple ownerships.

Listed below are the planning explanations of each individual element required as part of a complete Prescribed Fire Plan and implementation policy related to the element.

Element 1. Signature Page

The following information must be included on the signature page:

1. Administrative unit name.
2. Prescribed Fire Unit (burn unit)/Project name.
3. At a minimum, three dated signatures are required: a Prescribed Fire Plan Preparer, a Technical Reviewer, and an Agency Administrator. Additional signatures may be included as required by the individual unit.
4. Final determined complexity rating(s).
5. If the plan needs to be amended, the signed and dated amendments must be attached to the Prescribed Fire Plan (see Chapter 4).

Element 2. GO/NO-GO Checklists

Agency Administrator Pre-Ignition Approval Checklist

The Agency Administrator's Pre-Ignition Approval Checklist (Burn Plan Template, Appendix B) is required to be completed. The Agency Administrator's Pre-Ignition Approval Checklist evaluates whether compliance requirements, Prescribed Fire Plan's elements, and internal and external notification(s) have been completed and expresses the Agency Administrator's intent to implement the Prescribed Fire Plan. The checklist establishes the expiration date for the implementation of the Prescribed Fire Plan. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval is required. An 'acting' Agency Administrator may sign the Agency Administrator Pre-Ignition Approval Checklist if authority to do so has been delegated. If the Prescribed Fire Plan is amended, a review and re-validation of the Agency Administrator Pre-Ignition Approval Checklist would be required and included in the Project File.

Prescribed Fire GO/NO-GO Checklist

Prior to all ignition operations, the assigned Prescribed Fire Burn Boss will complete and sign the Prescribed Fire GO/NO-GO Checklist (Burn Plan Template, Appendix B). This checklist is a minimum standard and agencies may elect to add questions and/or approval signatures. For each day of active ignition on a prescribed fire, a separate daily GO/NO-GO Checklist is required.

Element 3. Complexity Analysis

Risk management is a foundation for all prescribed fire activities. Risks and uncertainties

relating to prescribed fire activities must be understood, analyzed, communicated, and managed as they relate to the cost of either doing or not doing an activity. At a minimum, those risks from the Complexity Analysis that are rated high and can not be mitigated will be identified with a discussion of the risks associated in the Summary Complexity Rating Rationale. This discussion will also be included in the Complexity Analysis Summary page (Burn Plan Template, Appendix B).

The Prescribed Fire Complexity Rating must be completed utilizing the Prescribed Fire Complexity Rating System Guide, NWCG, January, 2004 (or current version).

The purpose of the complexity rating process is to provide:

- Assignment of a complexity rating of high, moderate, or low to the prescribed fire.
- Management and implementation personnel a relative ranking as to the overall complexity of a specific prescribed fire project.
- A process that can be used to identify Prescribed Fire Plan elements or characteristics that may pose special problems or concerns.
- A process that identifies mitigation activities needed to reduce the risk/hazard to the implementation personnel and public as well as mitigating potential resource damage.

A preliminary rating will be completed early in the Prescribed Fire Plan development stage. This will identify potential concerns that may be mitigated during the plan preparation process. Once the Prescribed Fire Plan is near completion, the final complexity rating is made. The final complexity rating will be used as a basis for determining prescribed fire organization, Prescribed Fire Burn Boss level, and mitigation measures.

The Summary Complexity Rating Rationale will clearly justify the summary rating for prescribed fire organization and Prescribed Fire Burn Boss level. It must also identify those risks from the Complexity Analysis that are rated high and can not be mitigated and will provide a discussion of the risks associated. The Complexity Analysis must be signed by the Prescribed Fire Plan Preparer and the Agency Administrator and attached as an appendix to the Prescribed Fire Plan. The Complexity Analysis Summary will be attached to the Prescribed Fire Plan following the GO/NO-GO Checklists.

Separate prescriptions and/or burn organizations for different stages of implementation may result in multiple Complexity Analyses and ratings. For example, a plan may have separate prescriptions for spring and fall burning which may require different organizations and constitute the need for additional complexity analyses.

If a prescribed fire complexity changes which results in different Prescribed Fire Burn Boss qualifications, a separate complexity analysis is required. For example, for certain prescribed fires conducted over time, progressive or sequential actions may reduce complexity, organization and Prescribed Fire Burn Boss qualifications. (e.g. a large scale, high complexity prescribed fire has been black-lined, portions burned and operations suspended for a period of time then resumed to continue or finish the prescribed fire). In this case, a separate Complexity Analysis will be developed to reflect the reduced complexity rating and will be included in the appendix of the Prescribed Fire Plan.

Element 4. Description of the Prescribed Fire Area

A. Physical Description

This section of the plan will describe the physical features of the prescribed fire area.

- Location: Narrative description of the location of the prescribed fire project including a legal description, UTM and/or latitude/longitude (decimal degrees; NAD83 preferred), county, and state.
- Size: Area, in acres, of the prescribed fire project with a breakdown by prescribed fire unit and/or ownership if applicable.

- Topography: Identify the upper and lower range of elevation, slope(s) –maximum/minimum and average, and aspect(s) of the prescribed fire project.

- Project Boundary: **The project boundary defines that area where fire will be ignited and may be allowed to burn (some agencies previously called this Maximum Management Area or Allowable Area).** Describe the physical, natural and/or human made boundaries (including multiple units) of the prescribed fire project. This will be done through maps and may include narratives. The entire prescribed fire project area must be analyzed under NEPA.

B. Vegetation/Fuels Description

This is a description of current vegetation and fuels in the project area and should discuss history including past environmental effects or land management practices and how they have impacted the fuel characteristics. Identify any reference material used.

- Describe the structure and composition of the vegetation type(s) and fuel characteristics. This description may include natural or activity fuels, total fuel load (both live and dead) in tons/acre, dead fuel load by time-lag size classes, live fuel load (woody/herbaceous), fuel bed depth, and vertical and horizontal arrangement within the project boundary.

- Describe the percent of the unit composed of each vegetative type and the corresponding fuel model(s).

- Identify conditions (fuels, slope, and aspect) in and adjacent to boundaries that may be a potential threat for escaped fire.

- Identify any abiotic conditions like airshed, climate, soils, etc. as appropriate.

C. Description of Unique Features and Resources:

List and discuss special features, hazards, regulations, issues, constraints, etc. Examples may include: fences to protect, power poles, historical/cultural sites, threatened and endangered species or habitat, etc.

D. Maps:

Maps will be developed and included in the Prescribed Fire Plan. At a minimum, the plan will include a vicinity and project map. The number of maps, map size and scale, legend and level of detail should be appropriate for the complexity of the project. All maps will include the standard mapping elements: title, name of preparer(s), date, north arrow, scale, and legend.

- Vicinity Map: Shows prominent features including roads, streams, water sources, towns, structures, and the proximity of the burn unit(s) to these features. Transportation route(s) will be identified. Map scale will be such that the burn units can be located on the ground and in sufficient detail to guide implementation.

- Project Map(s): The project map(s) identify features in sufficient detail to guide and assist in operational implementation of the prescribed fire. Topographic, vegetative, or aerial photo maps should be used as the base map. ICS map display symbols, identified in the Fireline Handbook PMS 410-1 will be used as appropriate. Examples of features that should be included on the project map(s) are: project boundary, individual unit boundaries, ownership, fireline locations, natural barriers, fuel model locations, proposed ignition patterns and sequence, critical holding points, hazards, safety

zones, escape routes, helispots, areas of special concern, smoke management issues (predicted plume dispersion, sensitive receptors, etc), escaped fire contingency actions (primary and secondary control lines, trigger points, etc), water sources, location of treatment monitoring plots, etc. if these are significant in communicating project implementation.

Element 5. Goals and Objectives

A short summary description will be developed that identifies the purpose of the prescribed fire and the resource management goals from the supporting L/RMPs and/or NEPA documents. The summary will identify desired future conditions of the prescribed fire project. This should be consistent with the appropriate land management goals. Include a discussion of future Fire Regime Condition Class (FRCC) post-treatment conditions if applicable.

Describe in clear, concise statements the specific measurable resource and fire objectives for this prescribed fire. Objectives will be measurable and quantifiable so prescription elements can be developed to meet those objectives and the success of the project can be determined following implementation.

Element 6. Funding

Identify the funding source(s) and estimated cost(s) of the prescribed fire. Itemize by phase if desired.

Element 7. Prescription

Prescription is defined as the measurable criteria that define a range of conditions during which a prescribed fire may be ignited and held as a prescribed fire.

The plan prescription will describe a range of low to high limits for the environmental (weather, topography, fuels, etc.) and fire behavior (flame lengths, rate of spread, spotting distance, etc.) parameters required to meet Prescribed Fire Plan objectives while meeting smoke management and control objectives.

Parameters are quantitative variables expressed as a range that result in acceptable fire behavior and smoke management.

The range of prescribed fire behavior characteristics (outputs such as: flame lengths, rates of spread, scorch heights, mortality, spotting, etc.) identified in the plan will help determine the acceptable combination of environmental parameters (inputs such as: weather, topography and fuels) under which the prescribed fire can be conducted. In many cases, burning under the extremes of all prescriptive parameters would not meet or possibly exceed the desired prescribed fire behavior characteristics and are therefore out of prescription. The Prescribed Fire Burn Boss must ensure that the prescriptive parameters and fire behavior characteristics as identified in the Prescribed Fire Plan are not exceeded. Empirical evidence (historical evidence or researched data) and judgment may be utilized to identify or calibrate prescriptions. Weaknesses in modeling can be overridden, but must be justified with empirical evidence and/or verified actual fire behavior.

Separate prescriptions may be needed for multiple fuel model conditions to address seasonal differences and/or types of ignition (black lining, aerial ignition, etc). Separate prescriptions may result in multiple complexity ratings and burn organizations. For example, a separate prescription is needed for black-lining operations if conditions will be significantly different from the primary prescription or if the holding resources differ from those identified for ignition and holding phases. Separate prescriptions may result in the need to identify multiple levels of management, organizational structures, implementation measures, and pre-burn considerations.

Holding and contingency plans must be developed with the consideration of the predicted fire behavior outside the project boundary(s). Fire behavior characteristics for fuel models within the maximum spotting distance and/or adjacent to the project boundaries must be considered and modeled using worst-case fire behavior predictions. These predictions will be identified from fire behavior model runs or empirical evidence of the hottest, driest, and windiest prescription limits identified in the Prescribed Fire Plan, along with the most

extreme environmental conditions (slope, aspect) identified.

A short fire behavior narrative that summarizes the fire behavior identified in the prescription and discusses how it will achieve the desired treatment objectives may be included.

When used, fire behavior calculations must be developed using an appropriate fire behavior modeling program. Include modeling and/or empirical evidence documentation as an appendix or in the fire behavior narrative.

Element 8. Scheduling

Identify the general ignition time frame(s) (i.e. time of day, duration of ignition) or season(s) and note any dates when the project may not be conducted. For prescribed fires with multiple ignitions or burn days, list projected duration.

At National Preparedness Levels Four and Five, prescribed fire implementation is restricted. See National Interagency Mobilization Guide for details.

Element 9. Pre-burn Considerations

Describe on and off-site actions and considerations that need to be conducted prior to implementation. Examples include clearances; line to be built; preparation of critical holding points; snags to be felled or protected; equipment to be pre-positioned; special features to be protected; warning signs to be placed; weather recording; fuels condition sampling; monitoring needs; responsibility; and timeframes.

Describe any fuel sampling and weather data that may need to be obtained (See Element 14: Test Fire). This data should be taken at the project site. If this is not possible, use the closest representative site.

The plan will include a list of organizations (including media) and individuals that are to be notified prior to ignition, with information necessary to make the contacts. Reasonable efforts will be made to notify adjacent land owners (or their agents) and other potentially impacted publics. Attempts and/or actual notifications will be documented with date and method and placed in the Project File.

Identify in the burn plan the method and frequency for obtaining weather and smoke management forecast(s).

Spot weather or local area forecasts are required prior to ignition, on all ignition days and any days the fire is actively spreading. A copy of the forecast will be included in the Project File. The Prescribed Fire Burn Boss or other person in charge of mop-up and patrol will also obtain and review the spot weather or area forecast to determine if mop up and patrol resources are adequate.

Element 10. Briefing

All assigned personnel must be briefed at the beginning of each operational period to ensure personnel safety considerations (including the JHA) and prescribed fire objectives and operations are clearly defined and understood. Briefing checklists are required to be included in the Prescribed Fire Plan and will include the following elements:

- Burn Organization and Assignments
- Burn Objectives and Prescription
- Description of the Prescribed Fire Area
- Expected Weather & Fire Behavior
- Communications
- Ignition Plan
- Holding Plan
- Contingency Plan and Assignments
- Wildfire Conversion
- Safety and Medical Plan

The briefing checklist should list briefing topics only, not re-state what is listed in the Prescribed Fire Plan for that element.

The Prescribed Fire Burn Boss will ensure that any new personnel arriving to the prescribed fire receives a briefing prior to assignment.

An Incident Action Plan (IAP) is optional, it is recommended for large multi-day or high complexity prescribed fires.

If aerial ignition devices will be used, include an Aerial Ignition briefing.

Element 11. Organization & Equipment

The complexity of each prescribed fire determines the organization capabilities needed to safely achieve the objectives specified in the Prescribed Fire Plan. Specify the minimum required implementation organization to meet the capabilities (line production rates, etc.) by position, equipment, and the supplies needed for all phases of the prescribed fire until declared out. At a minimum, a Prescribed Fire Burn Boss will be assigned to every prescribed fire. Positions that may not be filled as collateral duty will be identified in the organization chart of the Prescribed Fire Plan.

Standard ICS fire management principles for span of control and length of assignments will be adhered to when developing burn implementation organization(s) and used in managing prescribed fires. On prescribed fires with large organizations, use the ICS organization and staffing commensurate with the level of complexity. Consider the use of a Prescribed Fire Manager in conducting multiple prescribed fires.

Before implementation (all phases) of the prescribed fire, documentation in the form of an organization chart must be completed. Any changes to the organization during implementation must be documented. Any changes that reflect modification of the capabilities, equipment or supplies will require an amendment. Different organizations may be identified for different phases of implementation (i.e. holding v. mop-up and patrol, different ignition operations, different prescriptions).

Multiple prescriptions for one Prescribed Fire Plan are permissible and in some cases required (Element 7). Multiple prescriptions may require identifying and developing multiple organizations.

The Prescribed Fire Burn Boss is responsible for implementation including mop-up and patrol until the responsibility is formally passed to a Prescribed Fire Burn Boss, Prescribed Fire Manager or the local fire management organization.

Element 12. Communication

Develop communications plan specific to the project's implementation to address safety and tactical resource management needs. Identify and assign command, tactical, and air operations frequencies as needed. Also include any required telephone numbers. Cover under an Incident Action Plan, if utilized.

Element 13. Public & Personnel Safety, Medical

Describe provisions to be made for public and personnel safety. All personnel who are within the active burn area are required to wear personal protective equipment. Identify and analyze the safety hazards unique to the individual prescribed fire project and specify personnel safety and emergency procedures. Include safety hazards (including smoke exposure and impacts) and measures taken to reduce those hazards. Specify emergency medical procedures, evacuation methods, and emergency facilities to be used. A Job Hazard Analysis (JHA) is required for each prescribed fire project and will be attached to the Prescribed Fire Plan as an appendix.

Element 14. Test Fire

Provisions for a test fire are required and results must be recorded. The test fire must be ignited in a representative location and in an area that can be easily controlled. The purpose of the test fire is to verify that the prescribed fire behavior characteristics will meet management objectives and to verify predicted smoke dispersion. In many applications, analysis of the initial ignitions may provide adequate test fire results. On multiple-day projects, evaluation of current active fire behavior, in lieu of a test fire, may provide a comparative basis for continuing and must be documented. If in doubt however, initiate a separate test fire and evaluate results.

Prior to ignition of both the test fire and ignition operations, compare the Prescribed Fire Plan prescription elements, both individually and collectively, against local area or spot weather forecasts, other predicted conditions, and the actual conditions onsite (See element 9: Pre-Burn Considerations) to ensure that predicted

fire behavior will take place and/or weather parameters will not change to the point of the burn going out of prescription.

Element 15. Ignition Plan

Describe planned ignition operations including firing methods, devices, techniques, sequences, patterns, and ignition staffing for single or multiple unit operations. Maps showing proposed firing patterns may be included. If aerial ignition (or other aerial operations) is planned, cover aviation operations, organization, and safety within the Prescribed Fire Plan, Aerial Ignition Plan, or in an agency specific Aviation Operating Plan (Refer to the Interagency Helicopter Operations Guide, {NFES #1885} and the Interagency Aerial Ignition Guide {NFES #1080}for more detailed information on this topic). Multiple prescriptions and ignition operations (blackline, primary, aerial, etc.) may require identifying and developing multiple ignition organizations.

Element 16. Holding Plan

Describe general procedures to be used for operations to maintain the fire within the project area and meet project objectives until the fire is declared out. This may include mop-up and/or patrol procedures. Describe critical holding points (if any) and mitigation actions. Critical holding points will be identified on the project map. Describe minimum capabilities needed for all phases of implementation (see Element 11: Organization and Equipment). If used, attach or reference modeling outputs or worksheets (i.e. Fireline Handbook production rates, BEHAVE, etc.) and/or documented empirical evidence to justify minimum holding resources required.

Different organizations may be identified for different phases of implementation (i.e. holding v. mop-up and patrol, different ignition operations, different prescriptions). Multiple prescriptions may require identifying multiple complexity ratings and developing multiple holding organizations.

If onsite resources are insufficient to meet the prescribed fire plan objectives, then the Burn Boss should implement the Contingency Plan or Wildfire Conversion.

Element 17. Contingency Plan

"...If the objectives are not being met the Contingency Plan, a required component of the Prescribed Fire Burn Plan, is implemented. If the Contingency Plan is successful at bringing the project back within the scope of the Prescribed Fire Burn Plan the project continues. If contingency objectives are not met the prescribed fire is converted to a wildfire and Extended Attack is undertaken."

Interagency Strategy for the Implementation of Federal Wildland Fire Management Policy, June 20, 2003, page 12.

Contingency planning is intended for more than just a response to an escaped fire. The contingency plan is the portion of the Prescribed Fire Plan that considers possible but unlikely events and the contingency resources and actions needed to mitigate those events.

Contingency planning is the determination of initial actions and additional resources needed if the prescribed fire is not meeting, exceeds, or threatens to exceed:

- Project or unit boundary
- Objectives
- Prescription parameters
- Minimum implementation organization
- Smoke impacts
- Other Prescribed Fire Plan elements

The contingency plan will establish trigger points or limits that indicate when additional holding resources and actions are needed.

Contingency planning includes the additional resources required, and the maximum acceptable response time for those resources. Resource needs should be based on fire behavior outputs tied to the worst case fire behavior scenario (as modeled in Element 7: Prescription). Separate contingency plans may be necessary and appropriate to address seasonal differences, types of ignitions or phases of the burn implementation as described in the prescriptions and ignition and holding plans developed for the burn.

Verify and document availability of identified contingency resources and response time on day of implementation. If contingency resources availability falls below plan levels, actions must be taken to secure operations until identified contingency resources are replaced.

The same contingency resource can be identified for multiple prescribed fire projects. When specific contingency resources are identified for more than one prescribed fire, the local fire management organization(s) must evaluate and document adequacy of all contingency resources within the area. This evaluation must consider:

- Local, current, and predicted fire danger
- Local and regional wildland fire activities.

Once a contingency resource is committed to a specific wildland fire action (wildfire, wildland fire use or prescribed fire), it can no longer be considered a contingency resource for another prescribed fire project and a suitable replacement contingency resource must be identified or the ignition halted.

The Agency Administrator will determine if and when they are to be notified that contingency actions are being taken.

If the contingency actions are successful at bringing the project back within the scope of the Prescribed Fire Plan, the project may continue. If contingency actions are not successful by the end of the next burning period, then the prescribed fire will be converted to a wildfire.

Element 18. Wildfire Conversion

The Prescribed Fire Plan will specify who has the authority to declare a wildfire. A prescribed fire must be declared a wildfire by those identified in the plan when that person(s) determines that the contingency actions have failed or are likely to fail and cannot be mitigated by the end of the next burning period by on-site holding forces and any listed contingency resources. In addition, an escaped prescribed fire must be declared a wildfire when the fire has spread outside the project boundary, or is likely to do so, and cannot be contained by the end of the next burning period. A prescribed fire can be converted to a wildfire for reasons other than an escape.

Describe the actions to be taken when a prescribed fire is declared a wildfire (refer to Wildland Fire and Aviation Program Management and Operations Guide {BIA--Blue Book} and Interagency Standards for Fire and Aviation {Red Book}). Description will include:

- Wildfire declaration (by whom)
- IC assignment
- Notifications: dispatch, Agency Administrator, adjacent land owners, etc.
- Extended attack actions and opportunities to aid in suppression efforts.

After a wildfire declaration, an escaped prescribed fire cannot be returned to prescribed fire status. A WFSA will define appropriate future management actions.

Element 19. Smoke Management & Air Quality

Describe how the project will comply with local community, County, State, Tribal, and Federal air quality regulations. Identify what permits, if any, need to be obtained. Identify smoke sensitive areas including population centers, recreation areas, hospitals, airports, transportation corridors, schools, non-attainment areas, Class I air sheds, and restricted areas that may be impacted. Include modeling outputs and mitigation strategies and techniques to reduce the impacts of smoke production, if required by State Implementation Plans (SIPs) and/or State or local regulations. Reference the Smoke Management Guide for Prescribed and Wildland Fire 2001 Edition for other smoke management planning suggestions and smoke management techniques for reducing or redistributing emissions.

Special considerations must be taken to address smoke when the project is in a non-attainment area for a National Ambient Air Quality Standards including insuring compliance with SIP/TIP provisions and addressing Conformity. Projects which will potentially impact Class I areas should address any efforts to minimize smoke impacts on visibility. Comply with all local, State, Tribal and Federal pre-burn and post-burn data reporting requirements.

Element 20. Monitoring

Prescribed fire monitoring is defined as the collection and analysis of repeated observations or measurements to evaluate changes in condition and progress toward meeting a management objective. Describe the monitoring that will be required to ensure that Prescribed Fire Plan objectives are met. For the prescribed fire, at a minimum specify the weather, fire behavior and fuels information (forecast and observed) and smoke dispersal monitoring required during all phases of the project and the procedures for acquiring it, including who and when.

Element 21. Post-burn Activities

Describe the post-burn activities that must be completed. This may include post-burn report, safety mitigation measures, and rehabilitation needs including those as a result of pre-burn activities undertaken.

Appendices.

Include all the required appendices.

A. Maps

B. Technical Review Checklist

C. Complexity Analysis

D. Job Hazard Analysis

E. Fire Behavior Modeling Documentation or Empirical Documentation

Project File

All prescribed fire Project Files will contain the following information. Agencies and/or administrative units may require additional information.

1. Prescribed Fire Plan
2. Monitoring data including weather, fire behavior, fire effects and smoke dispersal observations
3. Weather forecasts
4. Notifications
5. Documented prescribed fire organization(s)
6. Any agreements related to implementation
7. Multiple day GO/NO-GO checklist(s), if applicable
8. Re-validation of the Agency Administrator Pre-Ignition Approval checklist

Depending on the scope and complexity of the prescribed fire, optional information and/or further documentation that may be included in the Project File include:

1. After Action Review (see Chapter 8)
2. Incident Action Plans, Unit Logs
3. Press releases, etc
4. Implementation costs
5. Actual ignition patterns and sequences used
6. Smoke management information
7. Agency individual fire occurrence form
8. Detailed Post Burn Report
9. NEPA documentation
10. Permits

Reviews

After Action Review (AAR)

Each operational shift on a prescribed fire should have an informal After Action Review (AAR). Certain events or a culmination of events that may affect future prescribed fire implementation and/or policy should be submitted via the Roll-up documentation (Found at http://www.wildfirelessons.net). The questions to answer in conducting an AAR are:

1. What did we set out to do (what was planned)?
2. What actually happened?
3. Why did it happen that way?
4. What should be sustained? What can be improved?

Escaped Fire Reviews

The Agency Administrator will be notified of an escaped fire. The Agency Administrator is required to make the proper notifications. All prescribed fires declared a wildfire will have an investigative review initiated by the Agency Administrator. The level and scope of the review will be determined by policy and procedures in Wildland Fire and Aviation Program Management and Operations Guide (BIA--Blue Book) or Interagency Standards for Fire and Aviation (Red Book).

The goal of the escaped prescribed fire review process is to guide future program actions by minimizing future resource damage and/or preventing future escapes from occurring by gathering knowledge and insight for incorporation into future resource management and prescribed fire planning. The objectives of the review are to:

- Determine if the Prescribed Fire Plan was adequate for the project and complied with policy and guidance related to prescribe fire planning and implementation.
- Determine if the prescription, actions, and procedures set forth in the Prescribed Fire Plan were followed.
- Describe and document factual information pertaining to the review.
- Determine if overall policy, guidance, and procedures relating to prescribed fire operations are adequate.
- Determine the level of awareness and the understanding of the personnel involved, in regard to procedures and guidance.

At a minimum, the escaped fire review report will include the following elements:

1. An analysis of seasonal severity, weather events, and on-site conditions leading up to the wildfire declaration.
2. An analysis of the actions taken leading up to the wildfire declaration for consistency with the Prescribed Fire Plan.
3. An analysis of the Prescribed Fire Plan for consistency with policy.
4. An analysis of the prescribed fire prescription and associated environmental parameters.
5. A review of the approving line officer's qualifications, experience, and involvement.
6. A review of the qualifications and experience of key personnel involved.
7. A summary of causal agents contributing to the wildfire declaration.

Document the incident, including all actions prior to and after the escape. Set up a file that includes all pertinent information, i.e., the Prescribed Fire Plan; a chronology of events including the prescribed fire report; unit logs and individual statements; weather forecasts including any spot forecasts; weather information taken on site and Remote Automated Weather Station (RAWS) and National Fire Danger Rating System (NFDRS) data for the day of the escape from the nearest station(s); photos; and all other pertinent information. Since all prescribed fires are planned management actions, an escape may lead to a Tort Claim and liability issues. Special attention to documentation is critical.

An independent review team is recommended for conducting escaped fire reviews. The number of individuals assigned to the team and their functional expertise should be commensurate with the scope and focus of the review. Interagency participation is highly recommended for all prescribed fire reviews.

Appendix B: Prescribed Fire Plan Template

A standardized, reproducible template form for the Prescribed Fire Plan development process is included in this appendix. A standardized format is provided for the Prescribed Fire Plan in PDF. An electronic version editable in Word is also available. Users should prepare the plan using the electronic version.

In the electronic Word version, the Project Name and/or Unit Name should be entered in the document's header which will automatically appear on each following page of the plan.

To insert information into the document's header:

1. Double-click in the header region (upper region of each page displayed on the screen).
2. Type Project and/or Unit information.
3. Double-click *outside* the header region in the body of the document.

You may also access the header under **View > Headers and Footers**. This will open the header region for edits automatically. After entering the information, go again to **View > Headers and Footers** which will return you to being able to enter information into the body of the document.

ELEMENT 2: AGENCY ADMINISTRATOR PRE-IGNITION APPROVAL CHECKLIST

Instructions: The Agency Administrator's Pre-Ignition Approval is the intermediate planning review process (i.e. between the Prescribed Fire Complexity Rating System Guide and Go/No-Go Checklist) that should be completed before a prescribed fire can be implemented. The Agency Administrator's Pre-Ignition Approval evaluates whether compliance requirements, Prescribed Fire Plan elements, and internal and external notifications have been or will be completed and expresses the Agency Administrator's intent to implement the Prescribed Fire Plan. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval will be required.

YES	NO	KEY ELEMENT QUESTIONS
		Is the Prescribed Fire Plan up to date? *Hints: amendments, seasonality.*
		Will all compliance requirements be completed? *Hints: cultural, threatened and endangered species, smoke management, NEPA.*
		Is risk management in place and the residual risk acceptable? *Hints: Prescribed Fire Complexity Rating Guide completed with rational and mitigation measures identified and documented?*
		Will all elements of the Prescribed Fire Plan be met? *Hints: Preparation work, mitigation, weather, organization, prescription, contingency resources*
		Will all internal and external notifications and media releases be completed? *Hints: Preparedness level restrictions*
		Will key agency staff be fully briefed and understand prescribed fire implementation?
		Are there any other extenuating circumstances that would preclude the successful implementation of the plan?
		Have you determined if and when you are to be notified that contingency actions are being taken? Will this be communicated to the Burn Boss?
		Other:

ELEMENT 2: PRESCRIBED FIRE GO/NO-GO CHECKLIST

	YES	NO
A. Has the burn unit experienced unusual drought conditions or contain above normal fuel loadings which were not considered in the prescription development? If NO proceed with checklist., if YES go to item B.		
B. If YES have appropriate changes been made to the Ignition and Holding plan and the Mop Up and Patrol Plans? If YES proceed with checklist below, if NO STOP.		

YES	NO	QUESTIONS
		Are ALL fire prescription elements met?
		Are ALL smoke management specifications met?
		Has ALL required current and projected fire weather forecast been obtained and are they favorable?
		Are ALL planned operations personnel and equipment on-site, available, and operational?
		Has the availability of ALL contingency resources been checked, and are they available?
		Have ALL personnel been briefed on the project objectives, their assignment, safety hazards, escape routes, and safety zones?
		Have all the pre-burn considerations identified in the Prescribed Fire Plan been completed or addressed?
		Have ALL the required notifications been made?
		Are ALL permits and clearances obtained?
		In your opinion, can the burn be carried out according to the Prescribed Fire Plan and will it meet the planned objective?

If all the questions were answered "YES" proceed with a test fire. Document the current conditions, location, and results

B. EXECUTIVE SUMMARY

Tall grass prairies once covered more than 140 million acres of the United States, from Indiana to Kansas and from Canada to Texas. Nearly all of it is gone, plowed under for agriculture. Prairies respond to their environment, which includes soil type, water availability, and natural processes such as grazing and fire. Most ecologists agree that for the last 5,000 years, prairie vegetation would have mostly disappeared if it had not been for the burning of these grasslands. After climate it can be said that *fire* is the next most important determinant in the spread and maintenance of prairie grassland.

Remnants of these tall grass prairies can be found at George Washington Carver National Monument. With management ignited prescribed fire, these fragile ecosystems will be preserved for generations to come.

This plan encompasses all nine burn units in the park. All nine will not be burned in any one year. The five year burn schedule in the park's Fire Management Plan and the entry of individual burn units in NFPORS will dictate which units will get treated each year.

C. DESCRIPTION OF PRESCRIBED FIRE AREA

GENERAL AREA: **George Washington Carver National Monument/2 miles west of Diamond, MO.**

LOCATION:

1. Latitude N 36' 59' 17" (36.98836)
   Longitude W 94' 21' 22" (096.35480)

Fire Management Zone: Suppression (Tallgrass Prairie).

GEOGRAPHIC ATTRIBUTES:

Size: 88 total acres

Elevation: 1050'

Slope Range: 0-5%

Aspect Range: Flat to rolling

DESCRIPTION OF PROJECT BOUNDARIES:

The units scheduled for treatment are outlined in the five year schedule in the park's fire management plan. For this year, FY2006, units 3, 4, 5, 6, and 7b will be treated. Units 3 and 6 will be combined since they lie adjacent to one another.

Units 3 and 6: The north boundary will be the woods north of unit 6. The east boundary will be the woods and the service road separating these units from unit4. The south boundary will be the barbed wired fence south of unit 3. The west boundary will be the park boundary.

Unit 4: The east boundary will be the service road the separates units 4 and 5 and the mowed cool season grasses around the visitor center construction zone. The north boundary will be the woods north of unit 4. The west and south boundaries will be the service road.

Unit 5: The north boundary will be the mowed line adjacent to the park's development sub-zone. The east boundary will be the park boundary. The south boundary with be the park boundary. The west boundary will be the service road that separates units 4 and 5, and the barbed wire fence that extends from the service road to the south park boundary.

Unit 7b: The north boundary will be the woods north of the unit. The east boundary will be the park boundary. The south boundary will be the manicured lawn. The west boundary will be the woods west of the unit.

VEGETATION DESCRIPTION:

Fuel Model 3 occurs throughout the units. Some woody species are encroaching into the prairies. Fuel Model 9 and 1 surround the units.

Vegetation type	Fuel Model NFFL	Estimated Acres	Estimated Tons Per Acre
100% Tall grass prairie	3	80	3

PROJECT MAP (attachment)

VICINITY MAP (attachment)

D. GOALS AND OBJECTIVES

GOALS

1. Provide for firefighter safety.
2. Promote public awareness and support for the NPS Fire Management Program.
3. Restore fire and associated natural ecological processes in order to retain species composition and other characteristics of natural communities.
4. Maintain and expand prairie complexes.
5. Reduce hazardous fuels.
6. Keep the fire from escaping or damaging public or government property.
7. Enhance Wildlife habitat.
8. Provide for training opportunities for firefighters.

SPECIFIC OBJECTIVES:	PROPOSED REDUCTION WITHIN ONE YEAR	ACTUAL RESULTS
Burn units with low to moderate intensity	75-95%	
Top-kill woody species encroaching prairies	>75%	

Range of Acceptable Results Expected Across The Project Area

Throughout the entire unit a mosaic of different levels of fire severity are desired and acceptable.

E. PROJECT COMPLEXITY

This burn rates as a low complexity project that should pose no unusual risks to personnel safety or property. Burn duration will be 24 hours or less, with isolated residual burning expected in fuel jackpots.

HAZARD, RISK AND COMPLEXITY WORKSHEETS (attached)

F. ORGANIZATION

The Burn Boss may order additional resources to assist with the project as long as no slopovers or spot fires are occurring. The holding resource worksheet and Fireline Handbook will be used to determine adequate number and type of holding resources for each scenario. Specific resources will be identified in an incident action plan prepared prior to each operational period during the implementation of the burn. While FM3 is the fuel model that represents the burn units, FM9 surrounds the units and is the fuel model used on the holding resources worksheet to determine adequate holding resources.

Total of (12) persons will be the minimum required conducting the prescribed fire.

Overhead Personnel:
1 Burn Boss/ Incident Commander (RXB2)

Additional Crews/Personnel/Resources For Daytime Holding and Ignition Operations:
2 FFT2 – Ignition Crew
2 Type 6 engines with engine boss and operator.
2 ATVs with Water Tanks and operators
3 FFT2- Holding Crew

G. ESTIMATED PROJECT COSTS (non-base, other agency, contract):

Costs will be primarily for personnel and equipment preparing and conducting burn operations. The unit requires some preparation. Firing operations and post firing patrols should be of short duration with the goal of keeping overall costs low.

FUNCTION	**PROJECTED WORK HOURS/**	**PROJECTED COSTS***
Planning	8/Rx Fire Plan development, site visit	$100.00
Unit Preparation	40/brush hog line	$1000.00
Operations (including burning, holding, mop-up)	96	$4800.00
Monitoring & Evaluation	16	$100.00

TOTAL PROJECTED COST $6000.00 divided by 88_ acres = $68.18 PER ACRE

*Required information in final report: ACTUAL COSTS, COST PER ACRE, WORK HOURS PER ACRE.

H. SCHEDULING

Proposed Ignition Date:	March 22- April 12, 2006
Projected Burn Duration:	Less than 6 hours
Actual Ignition Date:	
Date Declared Out:	
Date DI-1202 Submitted:	

I. PRE-BURN CONSIDERATIONS

PREPARATION NEEDS ON SITE:

1. Eight to twelve foot wide fire lines will be mowed around the perimeter of burn units.

2. Rangers or designated traffic control will be available with 5 "smoke ahead" signs for V highway and the road adjacent to the park on the east.

3. Reduce fuel jackpots near control lines (cut and stack or scatter) within 100 ft. of control line.

4. Check all control lines for debris and remove as appropriate.

5. Coordinate burn schedule with GWCA staff to maximize chance of achieving objectives while minimizing impacts to park observations/visitation.

6. Ensure radios, and handtools for each assigned person, will be on scene.

7. Ensure minimum of six drip torches and 30 gallons of drip torch fuel will be on scene. This will be provided by resources assigned.

8. Take pre-burn photos of unit and record photo point locations.

9. Ensure engines can fill from either the hydrant near the visitor center or from a porta-tank. Hydrant will be tested the morning of the burn and necessary hardware attached to allow engines to quickly fill. If porta-tank is used, it will be filled and a pump set up with hardware to attach to an engine. The pump will be started to ensure its reliability before ignition begins. This will be done by resources assigned.

OFF SITE:

1. Coordinate daily weather and burn conditions monitoring with park staff for at least four days prior to ignition date.

2. Ensure notifications are made.

3. Ensure local media is contacted as appropriate.

4. Brief assigned personnel and park staff as appropriate.

5. Burn Boss will coordinate escape and other wildfire coverage with MDC (Neosho 417-451-4158) and Diamond VFD (417-325-4442 fire chief)

6. Spot weather forecast will be obtained from NWS in Springfield, MO (417-863-9124)

J. PRESCRIBED FIRE PRESCRIPTION

NFFL Fuel Models used: 3 100%

PRESCRIPTION

Weather	Range
Relative Humidity %	25-50%
Wind Direction	All
Mid Flame Wind Speed	0-8
Fuel Moisture (1 hour)	8-16%
(10 hour)	
(100 hour)	
Mixing height	≥1500'
Transport winds	≥7

FIRE CHARACTERISTICS

Characteristics	Range
Rate of Spread (chains/hour)	23-185
Flame Length (feet)	5.8-16
Fireline Intensity (btu/ft/s)	259-2342

K. IGNITION AND HOLDING ACTIONS

The Burn Boss or Ignition Specialist will thoroughly describe the firing plan and safety considerations to all burn personnel at the pre-burn briefing. Everyone will be provided a copy of the project map. Firing operations for the entire unit should be completed in one day.

Firing and Ignition:
A test fire will be lit near the main point of origin of the burn. The Burn Boss will decide the location of the test fire, which will depend on current and forecasted winds. Fuels and topography will be representative of most of the project. The Burn Boss will decide at that point to initiate the main burn or not.

Strip head fire will be used on the downwind side to establish a "black line". Once enough black is established on the down wind side, a ring fire technique will be used to finish off each unit. The Burn Boss and Ignition Specialist will develop an ignition plan prior to the pre-burn briefing. They will consider the current and expected weather for the day, primarily wind direction, to decide where to start ignition.

This plan will be explained to all burn personnel at the pre-burn briefing. Once a unit is complete, the Burn Boss will hold another briefing prior to igniting the next unit.

If prescription parameters are exceeded during project execution, the Burn Boss should terminate ignition operations at a safe and appropriate location based on fire behavior, fuels topography and weather conditions. If the project area comes back into prescription based on current and forecasted weather, ignition operations may continue. If not, the project area is put into a mop-up and patrol status. Holding actions shall maintain control of the fire until a decision to continue, postpone or extinguish the prescribed fire is made and the Agency Administrator or their designee is notified. The Burn Boss will document this decision process on a unit log.

Holding Actions:
All ATV's will be mobile and used accordingly to provide adequate patrol behind ignition teams. Engines will be used to lay down wet lines to ignite from. They will also perform structure protection near the visitor center and maintenance building. Holding crew personnel will take appropriate suppression actions on all slopovers and spot fires

Mop-Up Operations:
Mop-up will occur only for the purpose of maintaining control of the burn. Jackpots, snags, or problem areas will be secured through the use of water or foam. Chainsaw and handtools will only be used when other methods are not practical.

L. WILDLAND FIRE TRANSITION PLAN

1. If spot fires or slopovers occur, the Holding Squad Leader will initially supervise suppression actions.

2. If spot fires and/or slopovers cannot be controlled within one burning period with on site resources the Burn Boss will convert the fire to a wildland fire. A Wildland Fire Situation Analysis (WFSA) will be completed.

3. If the burn is converted to a wildland fire, the Burn Boss will make the declaration and assume the role of Incident Commander until relieved by an Incident Commander Type III (ICT3). If the Burn Boss is not a qualified ICT3, one will be ordered through the Missouri/Iowa Interagency Coordination Center (MOCC). The burn boss will immediately notify Park Dispatch (**417-325-4151**) and the Park Superintendent of the change in status to a wildland fire and will order resources through MOCC.

4. The Burn Boss will coordinate safety considerations with the section leaders (Holding, Ignition, and Monitoring) to provide and ensure the safety of ALL personnel assigned. All personnel will be assigned holding or suppression duties.

5. Water sources (drafting sites, hydrants, etc.) will be identified on the project map.

M. PROTECTION OF SENSITIVE FEATURES

N. PUBLIC AND PERSONNEL SAFETY

1. A safety briefing will be given at the pre-burn briefing and at the start of each operational period. All personnel will be advised of Lookouts, Communications, Escape Routes, and Safety Zones. Any other potential safety hazards will be pointed out and mitigated as soon as possible upon identification of hazard.

2. All burn personnel will wear standard firefighting personal protective equipment. They will carry a fire shelter and fire tool at all times.

3. Only red-carded personnel will be utilized during the burn.

4. All standard wildland firefighter safety rules will be strictly enforced (ref: Fireline Handbook).

5. V Hwy and the county road adjacent to the east boundary of the park will be signed to warn motorists of smoke and fire along the road. A total of five (5) signs will be need to sign the roads adjacent to the park. If smoke becomes a problem on the highway, then the burn boss will instigate traffic control using the park staff or burn staff under the following guidelines:

Monitoring Highway Visibility

Minimum Acceptable Visibility	Posted Speed Limit
< 100 Feet	Stop ALL traffic
100 Feet*	15 MPH
152 Feet*	20 MPH
216 Feet	25 MPH

* Requires that vehicles be stopped and told to proceed slowly

6. EMERGENCY MEDICAL PROCEDURES:

- EMT or First Responder assigned the day of the burn.
- First Aid equipment available and location made known to all burn personnel.
- Burn Boss notified immediately of injury.
- Burn Boss will coordinate with EMT/First Responder.
- Burn Boss will notify Park Dispatch of an injury and will follow up with information as soon as the injury has been assessed.
- EMT/First Responder will assess injury and begin treatment.
- Once injury has been assessed, the Burn Boss or designee will activate the appropriate EMS response for evacuation of injured personnel.
- If personnel need to be evacuated, park dispatch will dispatch/contact EMS resources from the following table:

RESOURCE	CONTACT PHONE NUMBER	LOCATION
METS (Metro Emergency Transport Service)	911	Joplin, MO
Newton County Ambulance Service	911	Newton County
Life Flight Dispatch Air Evac 1	911	 Joplin, MO
St. John's Regional Health Center Burn Unit	417-885-2876	Springfield, MO

O. SMOKE MANAGEMENT AND AIR QUALITY

COMPLIANCE:

In the state of Missouri, prescribed fire is considered to be agricultural burning and there are no burn or smoke permit requirements to ignite a prescribed burn. However, agency standards require meeting minimum requirements for mixing height and transport winds. The minimum mixing height is 1500 feet and a minimum transport wind of 7 mph. A smoke management forecast will be obtained the day of the prescribed burn and attached to the plan.

MODELING:

A smoke projection map is attached for all proposed wind directions.

MITIGATION:

Smoke production will be light to moderate, but will lift and disperse adequately as long as the burn is conducted within smoke management guidelines.

P. INTERAGENCY COORDINATION AND PUBLIC NOTIFICATION

1. The GWCA fire coordinator will produce a press release a minimum of two (2) days before the burn. Generally a single media release made prior to the particular burn season (fall or spring) suffices.

2. Fire management staff will notify the following at least one week prior to the proposed ignition date:
   - Park Superintendent
   - Senior Management Staff & District Rangers

3. Fire management staff will notify the following at least two days prior to the proposed ignition date:

MDC Forestry(Neosho-Gary Smith District Forester)	417-451-4158
MOCC	573-341-7455
Newton County Sheriff's Office	417-451-8333
Diamond Fire Department(Mark Garbett, Fire Chief)	417-325-4442
Neosho Fire (Greg Hickman, Fire Chief)	417-451-8021
Carthage Fire Department	417-237-7100
MWRO (Connie Burns)	402-661-1756
National Weather Service – Springfield, MO	417-863-9124

Park Neighbors:

Elza Winter	417-325-6212
Mike Funderburgh	417-325-5116
Jess Holler	417-325-6268
Melvin Alford	417-325-5280
Glen & Randi Brown	417-325-6292

4. The GWCA fire coordinator will provide advance notification to any groups who have made reservations to visit the park on the proposed burn day.
5. Additional contact information:

Bobby Bloodworth (Ozark FMO)	573-323-4236 x252 office
	573-300-0840 cell
Scott Bressler (Ozark Engine Foreman)	573-323-8234 x24 office
	573-300-0842 cell

Scott Beacham (MWR Fuels Specialist)	402-661-1768 office 402-651-8789 cell
Moria Painter (Ozark Fire Program Asst.)	573-323-4236 x233 office 573-300-0847 cell

**Notifications are to be made before the day of the burn, by either the Burn Boss, Fire Program Clerk, Fire Management Officer or designated person. Notifications will be recorded into dispatcher's log and on the original burn plan with the time, date and agency/person notified.

AGENCY/PERSON CONTACTED	DATE	TIME	CONTACTED BY

Q. MONITORING AND EVALUATION PROCEDURES

PRE-IGNITION:

Before ignition of the burn unit begins, an on-site weather observation will be taken no more than 30 minutes prior to ignition. The Burn Boss or designated person will be responsible for obtaining a fire weather and smoke management forecast for the day of the burn. The need for fire effects plots, transects, and/or photo points will be determined by Resource and Fire Management staff in consultation with Midwest Region and Ozark Ecoregion Fire Ecologists. Resource and Fire Management staff will determine the monitoring schedule and location(s).

The nearest associated NFDRS/WIMS station is at Mt. Vernon, MO (GOES ID#573063C8) Outputs from this station will be tracked, beginning at least one week prior to the proposed ignition date. Spot weather forecasts will be requested prior to the burn and each consecutive day of the burn from the **Springfield, MO NWS** office (417-863-9124). Actual on-site weather information will be reported back to the weather forecaster to help improve the forecasts during the burn.

DURING THE BURN:

During the burn, specific parameters will be observed and recorded on the attached observation form. The completed form will then be attached to the original burn plan. Included on this form will be smoke, weather, and fire behavior observations. The burn boss will determine if photo documentation is required and assign this duty to the FEMO(s) or designated observer. The burn boss will determine monitoring schedule as needed but observations will be taken at least hourly.

POST-BURN:

Post burn monitoring will occur as Resource and Fire Management staff in consultation with Midwest Region and Ozark Ecoregion Fire Ecologists determine the need.

R. POST FIRE REHABILITATION

"Light Hand on the Land" guidelines will be used to help minimize rehab needs. The following list of standards for the rehabilitation burn units can be adjusted for specific burn unit needs.

1. Flush cut stumps.
2. Remove flagging.
3. Build water bars on fire lines that are located on steep slopes.
4. Cover firelines to blend in with surrounding vegetation **after** the fire has been declared out.
5. Repair or stabilize damage to road shoulders.
6. Snag hazard trees at the discretion of the burn boss and holding specialist.
7. Close all access created by fire personnel and equipment.
8. Any other rehab as directed by appropriate Resource Management personnel.

No special rehab needs are anticipated for this burn unit.

S. POST FIRE REPORTS

Post fire reports shall be the responsibility of the burn boss and should be submitted within seven (7) days of the completion of the burn to the Ozark National Scenic Riverways Fire Management Office. The Fire Management Officer and Fire Program Assistant (FPA) will incorporate any long-term monitoring data or reports into the burn documentation package as they come available. The FPA will be responsible for entering required prescribed fire reporting information, including the 1202 and employee experience records, into SACS when they become available.

Documentation Package:

Documentation	YES	NO	N/A
1. Original Signed Plan			
2. All Reviewer Comments			

3. All Maps			
4. Notification Checklist			
5. Permits			
6. Weather Forecast			
7. Smoke Forecast			
8. Agency Administrator Go/No Go Checklist			
9. Operational Go/No Go Checklist			
10. Daily Validation			
11. Unit Logs			
12. Enter into Prescribed Files by FPA			
13. 1202 Completed and Entered into SACS

APPENDIX#4
Quarry Prescribed Fire
Hazard Rating Guide

Hazard Element	Hazard Probability			Potential Consequences		
	L	M	H	L	M	H
Environmental Data						
a. Seasonal severity	Energy Release Component below 90th percentile levels.	Energy Release Component at or above 90 th percentile levels – above average drought conditions.	Energy Release Component at or above 97th percentile levels – severe drought conditions.	Low probability for problematic fire behavior or difficulty in holding activities.	Some potential for problematic fire behavior or difficulty in holding activities.	High probability problematic fire behavior and difficulty in contr
b. Fire Behavior	Flame lengths confined to surface fuels, spread rates low.	Flame lengths extending into shrub and tree regeneration, spread rates moderate.	Flame lengths highly variable, frequently involving individual tree crowns, spread rates moderate to fast.	Low probability of difficulty in holding fire or for adverse fire effects.	Some potential for fire behavior to approach upper prescription limits and cause undesirable effects.	High potential fo fire behavior to create holding problems, excee prescription ranges, and cau undesirable effe
c. Fuels	Surface fuels light with open tree canopies, small shrub component present.	Surface fuels moderate with variable forest stand density and moderate shrub presence.	High surface fuel loading with dense shrub component and dense stands with abundant regeneration.	Fuels present no specific implementation problems.	Fuels will have a marked effect on implementation activities and holding force requirements.	Fuels will dramatically affe management organization an qualifications fo implementation.
d. Weather	Weather stable, winds light and predictable, no frontal activity.	Weather slightly variable, winds present but light, occasional gusts, no frontal activity.	Weather highly variable, winds near prescriptive limits, gusts prevalent, frontal activity possible.	Little impact on implementation.	Weather variation will require mitigation actions involving additional resources.	Weather will se as a major influence on organization, personnel qualifications, a specific implementation actions.
e. Topography	Low variability in slope and aspect.	Some variability in slope and aspect, will affect fuel moisture and fire behavior.	High variability in slope and aspect, major implications on fire behavior and must be considered in prescription development and implementation.	Little influence on burn implementation.	Consideration of topography during planning process is necessary.	Topography will necessitate mitigation actio to be develope and firing patte and ignition methods to be modified to redu impacts.

Agency Values						
a. Ecological and Environmental Considerations	Fire poses little threat to cause adverse effects or long- term disturbances to natural resource values. No T and E species or critical habitat.	Fire poses moderate threat of adverse effects on natural resources and may cause short- to mid-term alterations or inconveniences such as air quality. Small amounts of T and E species present.	Fire poses high potential for adverse effects to natural resource values or to cause long- term degradations in air quality. Some T and E species present and/ or critical habitat.	Low probability for adverse impacts and little need for mitigation actions.	Mitigation actions may need to be developed to ensure desirable outcomes. Some short- term effects may have to be accepted.	Prescribed Fire Plan must addre mitigation actior to prevent undesirable outcomes.
b. Social and Cultural Values	No known social or cultural values in or adjacent to the project area.	Features of social or cultural value have been identified in and adjacent to the project area. Mitigation measures can be accomplished.	High social or cultural values have been identified in or adjacent to the project area. Mitigation actions are difficult to accomplish.	Severe fire behavior or fire outside the unit would not damage the identified values.	Severe fire behavior or fire outside the unit poses potential for moderate damage to special values. Concerned parties are aware and supportive of the project.	Excessive fire severity or fire outside the unit have adverse effects (substan damage to or potential destruction of th special sites). Acceptance by concerned parti is low.
c. Project Duration and Logistics	Fire planned to be of short duration, logistical needs easily accommodated.	Fire planned to be of short to moderate duration, logistical needs pose some difficulty.	Fire planned to be of moderate to long duration, logistical needs create much difficulty in accomplishing.	No consequences because of duration or logistics.	Duration may impact firefighters and public and logistical needs must be specifically addressed.	Long duration fi necessitates greater informat dissemination, mitigation to remove impacts firefighters and public, and logistical needs must be met or project postpon
d. Smoke and Air Quality Management	Few smoke sensitive areas near project area. No potential scheduling conflicts with cooperators.	Multiple smoke sensitive areas, mitigation actions minimize impacts, low potential for scheduling conflicts.	Multiple smoke sensitive areas near burn area, mitigation actions unable to remove all impacts, duration increases impacts, high potential for scheduling conflicts.	No adverse smoke consequences.	Mitigation actions must address smoke impacts, and coordination is required to confirm scheduling.	Mitigation actior must be develop regulatory agen must concur, scheduling conf may restrict implementation.

Hazard Element	Hazard Probability			Potential Consequences		
	L	M	H	L	M	H
Public Values						
a. Land use values	No commercial or agriculture activities near planned burn area.	Some commercial or agricultural activities near burn unit, some managed wildlands (recreation, timber, range values).	Planned burn directly adjacent to urban, commercial, and/ or agriculture areas.	No impacts from land use values.	Escaped fire onto nearby managed land causes some impacts to commercial values. Prescribed Fire Plan must consider actions to prevent fire movement onto commercial and/ or agriculture lands.	Escaped fire ont nearby manage land causes significant impac to commercial values. Mitigatio actions must ref additional resou needs to protect urban, commerc and/ or agricultu areas. If mitigati cannot be accomplished, b must be postponed.
b. Dwellings	No permanent or part-time residences present in area.	Some residences ½ mile or less from burn area.	Planned burn is located in wildland-urban interface zone, permanent residences in close proximity.	No impacts from dwellings.	Plan must address actions to ensure adequate protection of residences.	Notification of al concerned homeowners, residents, and visitors, coordination wit local fire protect organizations is needed, and mitigation action must adequatel address potentia fire escapes.
c. Non-dwellings	No non- dwellings present.	Some outbuildings and non- residences ½ mile or less from burn area.	Commercial structures in close proximity to burn area.	No impacts.	Planning must consider these non- dwellings.	Planning and implementation must adequatel address all measures to prevent any adverse impacts

Human Factors						
a. Firefighter	Little firefighter exposure.	Some firefighter exposure due to fire duration and smoke.	Potential for high firefighter exposure to smoke during burn and to fire during holding actions.	No specific problems, implement standard safety measures.	Mitigation measures to eliminate smoke exposure.	Mitigation measures must address smoke exposure, use o mechanized equipment to eliminate exposu to fire.
b. Public	No public exposure.	Some public exposure, mitigation actions can remove/ minimize exposure.	Public may be exposed to high smoke concentrations for moderately long periods, especially during nighttime hours.	No adverse consequences anticipated.	Mitigation actions necessary to provide for maximum public safety.	Mitigation action must be develop coordinated with other emergency organizations ar fully understood prior to ignition.
c. Fire Management	No problems with commitment and acceptance by park staff members.	No problems with commitment but some unwillingness to support and prioritize the prescribed fire over other activities.	Park staff not committed to using prescribed fire as a tool and not willing to support and prioritize prescribed fire over other activities.	No adverse consequences.	Park staff must be briefed on need and importance of prescribed fire.	Park manageme team must be informed of prescribed fire objectives, supp needs, and prior

uman Factors				
a. Firefighter	M	Burn Boss will ensure that a complete safety briefing is provided for all assigned personnel. All standard wildland firefighter safety rules will be strictly enforced (ref. Fireline Handbook). Effects of smoke will be managed by limiting prolonged exposure for holding personnel as much as possible. Complete mitigation of smoke exposure hazard may not be possible.	M	N. PRESCRIBED FIRE COMPLEXITY RATING WORKSHEET

	Complexity Element	L	M	H
Primary Factors	1. Life and Safety		X	
	2. Threats to Boundaries		X	
	3. Management Organization	X		
	4. Political Concerns	X		
	SUBTOTAL OF PRIMARY FACTORS	2	2	
Secondary Factors	5. Objectives	X		
	6. Fuels and Fire Behavior	X		
	7. Air Quality Values	X		
	8. Improvements	X		
	9. Logistics	X		
	10. Natural, Cultural and Social Values	X		
	11. Tactical Operations	X		
	12. Interagency Coordination	X		
	SUBTOTAL OF SECONDARY FACTORS	8		
	TOTAL COUNT OF COMPLEXITY VALUES	10	2	

(Column header "Complexity Value" spans L, M, H.)

QUALIFICATIONS DETERMINATION TABLE:

	Prescribed Fire Burn Boss Type 2 (RXB2)	Prescribed Fire Burn Boss Type 1 (RXB1)
Primary Factors rated "H"	Less than 2	2 or more
	AND	OR
Total Count rated "H"	Less than 4	4 or more
		OR
	Minimum required on all prescribed fires.	When deemed appropriate by the agency administrator or unit Fire Management Officer.

Prescribed Fire Burn Boss Level Indicated (check one):	**RXB1**		**RXB2**	**X**

```
WELCOME TO THE BEHAVE SYSTEM
  BURN SUBSYSTEM
    FIRE1 PROGRAM: VERSION 4.4 -- FEBRUARY 1997

DEVELOPED BY:  THE FIRE BEHAVIOR RESEARCH WORK UNIT
               INTERMOUNTAIN FIRE SCIENCES LABORATORY
               MISSOULA, MONTANA

YOU ARE RESPONSIBLE FOR SUPPLYING VALID INPUT AND FOR
  CORRECTLY INTERPRETING THE FIRE BEHAVIOR PREDICTIONS.

ASSUMPTIONS, LIMITATIONS, AND APPLICATION OF MATHEMATICAL
  MODELS USED IN THIS PROGRAM ARE IN:
  Andrews, Patricia L. "BEHAVE: Fire behavior prediction and
    fuel modeling system--BURN subsystem, Part 1", INT-GTR-194, 1986
  Andrews, Patricia L., and Chase, Carolyn H. "BEHAVE: Fire
    behavior prediction and fuel modeling system--BURN
    subsystem, Part 2", INT-GTR-260, 1989

APPENDIX #6
AGENCY ADMINISTRATOR
GO/NO-GO PRE-IGNITION APPROVAL

Prescribed Fire Name: Date:

A) Instructions

The Agency Administrator's Go/No-Go Pre-Ignition Approval is the first of two GO/NO-GO decisions that must be completed before a prescribed fire can be implemented. The Agency Administrator's Go/No-Go Pre-Ignition Approval is the final management approval prior to execution of the prescribed fire and evaluates whether compliance requirements, prescribed fire plan elements, and internal and external notifications have been completed. The Agency Administrator's Go/No-Go Pre-Ignition Approval is valid for 30 days. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval will be required.

B) Key Elements

1. Is the prescribed fire plan up to date?
   Hints: changes, amendments, seasonality.

2. Have all compliance requirements been completed?
   Hints: cultural, threatened and endangered species, smoke management.

3. Is risk management in place and the residual risk acceptable?
   Hints: Prescribed Fire Mitigation Table and Prescribed Fire Complexity Rating Guide completed with rationale and mitigations identified.

4. Will all elements of the prescribed fire plan be met?
   Hint: preparation work, mitigation, weather, organization, prescription.

5. Have all internal and external notifications and media releases been completed?

6. Are key park staff fully briefed, and understand the implementation of the prescribed fire?

7. Other?

APPENDIX #7
Prescribed Fire Operations
GO/NO-GO Checklist

Prescribed Fire Name: Units 3,4,5,6, and 7b Date:

	YES	NO
- Has Agency Administrator GO/NO-GO Pre-Ignition Approval been approved?		
Narrative/Comments:		
- Are current and forecasted weather conditions favorable for execution of the prescribed fire? (hints: spot weather, dialogue with fire weather forecaster, climatological analysis complete)		
Narrative/Comments:		
- Have all key personnel listed on the Incident Action Plan (IAP) been briefed with an opportunity to give feedback? (hints: safety, objectives, assignments)		
Narrative/Comments:		
- Has all pre-burn preparedness work been completed? (hints: fuels and weather observations, signs, closures, smoke management, unit preparation)		
Narrative/Comments:		
- Are all equipment and supplies required in the prescribed fire plan in place and functional? (hints: pumps, radios, ignition devices, hose lays, vehicles, aviation, etc.)		
Narrative/Comments:		
- Are all holding resources described in the IAP committed and can be on-scene within specified time frames?		
Narrative/Comments:		
- Are all personnel certified for their assigned positions? (hints: Check Red Cards)		
Narrative/Comments:		
- There are no extenuating circumstances that preclude successful completion of this project? (hints: regional & national preparedness, unusual circumstances, unusual drought, outstanding issues, other fires, recent fire escapes, etc.)		
Narrative/Comments:		
IF ALL BOXES HAVE BEEN CHECKED "YES" YOU MAY PROCEED WITH THE TEST FIRE.		

	YES	NO
TEST FIRE DOCUMENTATION AND RESULTS:		
- Observed Fire Behavior within Prescription?		
Narrative/Comments:		
- Test fire was successful?		
Narrative/Comments:		
- Are all prescription parameters in the prescribed fire plan favorable for implementing the project? (hints: each plan element, pre-burn, smoke management, cooperator coordination)		
Narrative/Comments:		
IF LAST 3 BOXES ARE ALL "YES", YOU MAY PROCEED WITH PRESCRIBED FIRE.

IAP/BRIEFING GUIDE

I. Present Handouts
   A. Map of Burn
   B. Organization Chart

II. Describe Area Of Burn
   A. Vegetation Type
   B. Acreage
   C. Slope
   D. Roads/Access
   E. High Values at risk
   F. Water Sources-natural, tanker and hydrants
   G. Natural/Manmade barriers

III. Weather Forecast- Use National Weather Service "Forestry" and "Smoke Management" Forecasts for applicable Zones. Use "Fire Weather Special Request" Form if updates are deemed necessary.
   A. Wind direction and Speed
   B. Relative Humidity
   C. Temperatures
   D. Predicted Changes

IV. Organization
   A. Organization Chart – Location on Map
   B. Equipment - tankers, refueling, etc.
   C. Fire Monitoring
   D. Any other resources
   E. Transition Fire Plan

V. Firing Sequence
   A. Test fire
   B. Type and Sequence of Firing

VI. Radio Assignments
   A. Given Day of Burn
   B. Communication Plan

VII. Safety
   A. Winds
   B. Escape Routes and Safe Zones
   C. Hazards – crew and equipment (wildlife, research plots, trash, etc.)
   D. Personal Protective equipment (PPE)
   E. Refueling – fuel handling, gloves, spilling, etc.
   F. Activation of emergency and headlights on major roads
   G. Other public safety considerations

VIII. Comments and Questions Period

APPENDIX #9

ADEQUATE HOLDING RESOURCES WORKSHEET

Project Name: Units 3, 4, 5, 6, and 7b Fuel Models Inside Project Area: 3

Prepared By/Date: Bobby Bloodworth Fuel Models Outside Project Area: 9

Characteristics	Output type	Modeling Predictions Inside Project Area	Modeling Predictions Outside Project Area	Unit of Measure
CRITICAL FIRE INPUTS	1 Hr Fuel Moisture	8	8	%
	Wind Speed	8	8	MPH
	Slope	5	5	%
KEY FIRE BEHAVIOR OUTPUTS	Rate of Spread	185	16	ch/hr
	Fire line Intensity	2342	102	BTU/ft/sec

	POI			%
	Spotting Distance			Miles
	Scorch Height			Feet
FIRE SIZE	Projection Time	.5	1	Hours
	Forward Spread	92.7	16.2	Chains
	Backward Spread	2.7	0.5	Chains
FIRE CONTAINMENT	Method Of Attack	Rear	Rear	Head/Rear
	Max Escape Target	400	100	Acres
	Max Containment Time	5.9	68.6	Hours
	Total Line Building Rate	1372	40	Ch/hr

1. Choose worst case total line building rate above that is needed for containment of slop over or spot fire : 40ch/hr
2. Estimate potential number spot fires or slop overs at on time: 1
3. TOTAL LINE BUILDING RATE NEEDED (multiply line 1 times line 2) 40ch/hr
4. Production Rates: Ease of Access: POOR-FAIR-GOOD-EXCELLEN(circle)
   Fuel Resistance to Control LOW- MODERATE-HIGH-EXTREME(circle)

(refer to fire line handbook) Hand Crew Production 8 ch/hr
Engine Production (Crew of 2) 25 ch/hr
Dozer Production (Type ___) ______ch/hr

On Site Organization	Total # Planned On Burn	Total # Available for Spot Fire or Slop Over Control		Line Building Production Rates		Spot Fire or Slop Over Line Building Capacity
Overhead	1		x	8	ch/hr	
Firing Crew	2	2	X	8	ch/hr	16
Holding	3	2	X	8	ch/hr	16
Other Personnel			X	8	ch/hr	
Engine (Crew of 2)	2	1	X	25	ch/hr	25
Dozer (Size)			X		ch/hr	
Other Equipment: ATV's	2	2	X	8	ch/hr	16

5. TOTAL SLOP OVER OR SPOT FIRE LINE BUILDING RATE CAPACITY 73 ch/hr

6. DETERMINATION OF ADEQUATE HOLDING RESOURCES (Line 5 minus Line 3) 33 ch/hr

If number on line 6 is positive then adequate holding forces will be available. If number is negative, more holding resources are needed to control potential spot fires or slopovers.

APPENDIX #10
POST-PROJECT EVALUATION

Instructions for Completion of Post-Project Evaluation Form

This form is to be completed and submitted for review within 30 days of declaring the project complete.
Block 1 Self-explanatory
Block 2 Copy of the Project Objectives as listed in the Project Plan.
Block 3 Give quantitative results of how well objectives were met, i.e. % of 1 hour and 10 hour fuels removed, % of burn area with fuels reduced, % of area with acceptable/unacceptable scorch, etc.
Block 4 Give a short narrative of problems encountered and suggestions for improving or refining operations and prescriptions i.e. firing pattern, equipment limitations, drought index, effectiveness of barriers.
Block 5 Self-explanatory - for providing feedback to the Program

JOB HAZARD ANALYSIS

United States Department of Interior NATIONAL PARK SERVICE	1. WORK PROJECT/ACTIVITY Prescribed Fire	2. LOCATION George Washington Carver NM	3. UNIT Units 3, 4, 5, 6, 7b
JOB HAZARD ANALYSIS (JHA)	4. NAME OF ANALYST Scott Bressler	5. JOB TITLE Supervisory Forestry Technician	6. DATE PREPARED 01-18-02

7. TASKS/PROCEDURES	8. HAZARDS	9. ABATEMENT ACTIONS ENGINEERING CONTROLS – SUBSTITUTION - ADMINISTRATIVE CONTROLS - PPE
1. Ignition Operations	A. Proximity to intense heat and erratic fire behavior.	A. Use Personal Protective Equipment (PPE), maintain close supervision, and lookouts. Thorough briefing on expected fire behavior. Adjust ignition patterns as needed to reduce exposure and fire behavior.
	B. Noise of fire obscures verbal warnings.	B. Handheld radios for all ignition personnel.
	C. Ignition sources.	C. Use only qualified personnel for ignition operations. Igniters stay alert to location of torch flame. Close air vent when not igniting. Make sure that target area is clear before using hand flares or very pistols. Wear proper PPE.
	D. Incorrect ignition locations. Careless ignition use.	D. Thorough briefing of ignition plan. Follow burn boss's instructions. Know location of other igniters and personnel. Radios for all igniters. Close supervision.
	E. Poor footing, heavy fuels accumulation.	E. Be constantly aware; identify hazard areas; slow down.
	F. Poor visibility due to smoke.	F. Post lookouts on roads to gauge visibility. Stage emergency vehicles with headlights and emergency lights on along roads to alert traffic. Use law enforcement to control traffic.
2. Motor Vehicle Operation	A. General operations and public traffic.	A. Defensive driving techniques. Observe posted speed limits and obey all driving laws and regulations. Use spotter when backing. Use headlights while driving.
	B. Secure loads.	B. Check loads for security before departing – use tie downs.
	C. Hauling flammable substances.	

	D. Transporting sharp tools.	C. Use appropriate containers for hauling drip torch fuels and gasoline. Secure containers on vehicle. D. Use guards and secure tools in engine compartments or on vehicles.

JOB HAZARD ANALYSIS

United States Department of Interior NATIONAL PARK SERVICE	1. WORK PROJECT/ACTIVITY Prescribed Fire	2. LOCATION George Washington Carver NM	3. UNIT Units 3, 4, 5, 6, 7b

TABLE OF CONTENTS

APPENDECIES

B. EXECUTIVE SUMMARY

This will be the fifth entry with prescribed fire in this unit. It was previously burned in spring of 1994,1996, 1998 and 2002. The unit is part of Stegall Mountain Natural Area. Missouri Department of Conservation (MDC) and Ozark National Scenic Riverways (ONSR) have jointly developed management direction. Most of the area is a mosaic of glade and Savannah sites, which have become more forested and the glades, therefore, are "in imminent danger of...losing their open glade species."

The goals for this burn are to restore fire and associated natural processes to the natural communities in order to retain species composition and other characteristics of natural communities. This goal was developed jointly by ONSR and MDC during the natural area nomination process and is supported by the ONSR Resource Management Plan (RMP) project statements: OZAR #125 Develop/Implement Natural Area Management Plans; OZAR #73 Monitor and Mitigate Identified Park Threats; OZAR #121 Monitor and Protect Select Vegetation Communities; and OZAR #253 Participate on State Wildlife Management in the Park. The approved 1994 ONSR Fire Management Plan direction is to "maintain natural processes;" it allows prescribed burns "predicated on adequate vegetation studies, prescription development and coordination with adjacent agencies within the Natural Zone." The ONSR glade vegetation study and Stegall Mountain Natural Area Nomination provide the basis for establishing quantifiable objectives, developed through coordination with MDC and ONSR biologists.

C. DESCRIPTION OF PRESCRIBED FIRE AREA

GENERAL AREA:

LOCATION:

Legal:

1. T 28 N, R 2 W, SEC 17, 18, 19, 20
2. Latitude N 37'05 00"
   Longitude W 91'12 30"
3. UTM Zone_____, Easting__. Northing__.

Fire Management Zone: Suppression (Mixed Hardwood Forest).

District: North .

GEOGRAPHIC ATTRIBUTES:

Size: 1015 – 693 acres on Missouri Department of Conservation and 322 on Ozark National Scenic Riverways.

Elevation Range: Upper 1348' – Lower 680' – Change in Elevation 668'

Slope Range: 5-45%

Aspect Range: Generally northwest. East slopes, ridge-tops and west slopes occur on two main ridges.

DESCRIPTION OF PROJECT BOUNDARIES:

This area includes portions of Peck Ranch Wildlife Area managed by the Missouri Department of Conservation and Stegall Mountain near Rocky Falls is managed by Ozark National Scenic Riverways. The area is all in a State Natural Area. The boundary is divided into sections A-J based on landmarks, as indicated on the Project Map. The east boundary is the Ozark Trail (a hiking trail), Kelley Hollow Drainage and an old logging spur from the ridge road to the south. The south boundary is an old logging road and an improved gravel road leading to Stegall Mtn. Lookout Tower. The west boundary is the drainage in White Oak Hollow and 700' of hand-line to Shannon County road #525. The north boundary from west to east includes Shannon County road #525, Rocky Creek and about ½ mile of a dirt road from Rocky Falls to the Ozark Trail at the mouth of Kelley Hollow.

VEGETATION DESCRIPTION:

95% of the fuels adjacent to the unit are classified as Fuel Model 9.

Vegetation type	Fuel Model NFFL	Estimated Acres	Estimated Tons Per Acre
80% Oak-Pine Forest	9	812	3.5
20% Rhyolyte Glades	1	203	4

PROJECT MAP (attachment)

VICINITY MAP (attachment)

D. GOALS AND OBJECTIVES

GOALS

1. Provide for firefighter safety.
2. Burn with 1000 hour fuel moisture of approximately 17-19% to produce a moderately intense burn that will minimize damage to over-story trees, yet maximize the reduction of woody encroachment on glade and Savannah sites.
3. Promote natural ecological processes
4. Reduce hazardous fuels.
5. Promote public awareness and support for the NPS Fire Management Program.
6. Keep the fire from escaping or damaging public or government property.
7. Enhance Wildlife habitat.
8. Protect riparian areas.
9. Provide for training opportunities for firefighters.
10. Provide an opportunity to work with other agencies in a fire environment.

SPECIFIC OBJECTIVES:	PROPOSED REDUCTION WITHIN ONE YEAR	ACTUAL RESULTS
Kill saplings less than 4 inches d.b.h. in upland forest (ELT-ridge and side slope), opening up the stand structure for a more Savannah like appearance.	20-40%	
Top kill blackjack oak, winged elm and winged sumac <2 inches d.b.h. on glades and in glade margins.	70-90%	
Top kill blackjack oak and winged elm >2 inches d.b.h. on glades and in glade margins.	50-70%	
Burn unit with moderate intensity	75-90%	

<u>Range of Acceptable Results Expected Across The Project Area</u>

Throughout the entire unit a mosaic of different levels of fire severity are desired and acceptable.

E. PROJECT COMPLEXITY

This burn rates as a low complexity project that should pose no unusual risks to personnel safety or property. Burn duration will be 24 hours or less, with isolated residual burning expected in fuel jackpots.

HAZARD, RISK AND COMPLEXITY WORKSHEETS (attached)

F. ORGANIZATION

This burn unit overlaps two public ownerships, NPS and MDC. In order to ensure responsibility for the fire resides with an employee of that agency, the burn will be conducted under a unified command structure (I.C.S.). NPS and MDC will share Burn Boss responsibilities. The burn organization will be set up under the I.C.S. structure.

Personnel:

1. Fire Program Coordinators — NPS and MDC
2. Prescribed Burn Bosses — NPS and MDC
3. Division A — TBD
4. Division B — TBD
5. Division C — TBD
6. Group D/Interior Ignition Team — TBD
7. Fire Effects Monitors — NPS and MDC
8. Safety Officer — TBD
9. Fire Weather — TBD
10. Crew: Respective agencies will assign available, qualified individuals to specific teams by day prior to burn.

Burn will be divided into four divisions/groups. Each division will have both ignition and holding personnel assigned. Each division will work an ignition and holding team. MDC will be assigned Division B, C and Group D and will need to provide a Burn Boss, Ignition Crews, Holding Personnel, Holding Bosses and Ignition Bosses. NPS will be assigned Division A and provide a Burn Boss, Ignition Boss, Ignition Crew, Holding Boss and Holding Personnel. NPS will provide two type 6 wildland fire engines with operators that will be utilized in DIV B and C.

There will be one ignition team (Group D) with two persons that will ignite interior portions of the unit.

The structure and terminology of the burn will be under the Incident Command System (I.C.S.). However, personnel will not be required to be NIMS qualified to serve in certain position on this burn. (Example: A person will not be required to be a DIVS in order to supervise activities on a division.)

Equipment:

The Following equipment will be on hand the day of the burn:

NPS
6 Backpack pumps
2 portable pumps
500' of 1" hose
2 chainsaws
10 fire rakes
5 pulaskis
5 shovels
2 ATV's with water
2 Type 6 Wildland Fire Engines
2 Backpack Leaf Blowers
4 Drip Torches
30 Gal Drip Torch Fuel
2 Belt Weather Kits
Radios: Portable and Mobile

MDC
1 Tractor/plow (stand-by in Eminence Area)
1 Slip-on Pumper
2 Chainsaws
10 Fire Rakes
1 Portable Pump
2 Backpack Pumps
2 ATV's w/ water
4 Drip Torches
25 Gal Drip Torch Fuel
2 First Aid Kits
3 Backpack Leaf Blowers
2 Belt Weather Kits
4 Flappers
Radios: Portable and Mobile

Three portable pumps will be available with hose. Most holding will take place with crews and water carrying ATV's. A Type 6 NPS Fire engine with foam will be deployed at the top of Stegall Mountain along with an MDC pumper. Another NPS type 6 engine with foam will be positioned along north boundary road. One dozer (MDC) will be staged (location to be determined the day of the burn).

G. ESTIMATED PROJECT COSTS (non-base, other agency, contract):

FUNCTION	**PROJECTED WORK HOURS/**	**PROJECTED COSTS***
Planning	26/Rx Fire Plan development, site visit	$1000.00
Unit Preparation	78/blow line, hazard tree mitigation, brush hog line	$6500.00
Operations (including burning, holding, mop-up)	208	$11000.00
Monitoring & Evaluation	52 (collateral assignment) site visit coordination between OZAR staff and	$1000.00

TOTAL PROJECTED COST $ 19,500.00 divided by 322 acres = $ 60.56 PER ACRE
*Required information in final report: ACTUAL COSTS, COST PER ACRE, WORK HOURS PER ACRE.

H. SCHEDULING

Proposed Ignition Date:	January 25-April 25, 2006
Projected Burn Duration:	16 hours (8 hrs ignition, 8 hrs burning and 2 days mop-up.)
Actual Ignition Date:	
Date Declared Out:	
Date DI-1202 Submitted:	

I. PRE-BURN CONSIDERATIONS

PREPARATION NEEDS ON SITE:

Preparation tasks are assigned by each agency representative. See appendix 3 for maps of burn unit.

NPS – Remove leaf litter from tread of Ozark Trail and logging spur to Division A-B break. Place torch refueling cans in safe place along perimeter near Points 2 and 4. Orange ribbon will be placed along perimeter to mark hazards such as snags, etc. Hang white ribbon at division breaks and points A-J along perimeter.

MDC – Clear debris from around wooden electric line poles on one mile of Tower electrical line. Put in hand lines three feet wide to mineral soil along upper portion of White Oak Hollow (DIV B) and between White Oak Drainage and Shannon County Road #526. Grade Tower Road. Place refueling cans along perimeter near points 6 and 7. Complete radio coordination and radio checks.

OFF SITE:

1. Coordinate daily weather and burn conditions monitoring with park staff for at least four days prior to ignition date.

2. Ensure notifications are made.

3. Ensure local media is contacted as appropriate.

4. Brief assigned personnel and park staff as appropriate.

5. Burn Bosses will coordinate escape and other wildfire coverage with other NPS Districts, MDC (Eminence 226-3616) and USFS (325-4233).

6. Spot weather forecast will be obtained from NWS in Paducah, KY (502)744-0321

7. Each Burn Boss will ensure agency equipment is prepared 3 days before burn, and personnel are available to fill positions.

Special Precautions/Regulations: (Utility lines, historical sites, safety, etc.)

1. All NPS burn personnel will wear standard fire fighting leather boots, Nomex Pants and Shirt, leather gloves and hard had. NPS personnel will carry a fire shelter at all times. MDC personnel will meet agency specific requirements for PPE.

2. All standard wildland firefighter safety rules (LCES and 10 standard orders) will be strictly enforced (see Fireline Handbook).

3. NEPA compliance. The ONSR Resource Management Plan and Fire Management Plan which has an accompanying E.A. identifies prescribed burning as a permitted activity in the natural zone. No rare or endangered species are known to be in the area, except for state-listed *Viola Cuculatta,* which grows in a wet seep near Rocky Falls that is too wet to burn.

4. Fire Tower – It is bordered by >10 feet of green grass and a large gravel parking area on the north side. Heat from fire is a concern, so area within 100' should be burned out slowly, using water/foam if needed to limit heat production.

5. Electric ROW – Watch for arcing in heavy smoke. Rake around poles to prevent them from catching fire.

6. No foam concentrate or solution will be handled, mixed or sprayed within 50' of any water source, including wet seeps containing *Viola Cuculatta.*

7. Minimize smoke concentrations by burning with a daytime visibility of at least 6 miles and a minimum mixing height of 500 meters (1640 feet); a transport windspeed of at least 9 mph and a following nighttime forecast of no area fog and a minimum nightime 20' windspeed of 6 mph.

8. The ignition team lighting spot fires on central ridge will have radios and stay in visual contact of each other during ignition. Safety zones will be in rocky areas of glades.

9. The ignition team lighting in Terrapin Hollow will light walking down hollow toward Shannon County Road #525. Safety zones will be downhill, staying in the stream channel, to the road.

J. PRESCRIBED FIRE PRESCRIPTION

NFFL Fuel Models used: 80% FM 9 – 20% FM 3

PRESCRIPTION

Weather	Range
Temperature F	55-75
Relative Humidity %	22-45%
Wind Direction	SSE-N (Prefer SW)
Mid Flame Wind Speed	2-5
Fuel Moisture (1 hour)	5-10%
(10 hour)	8-12%
(100 hour)	15-21%
Mixing height	1500'
Transport winds	9

FIRE CHARACTERISTICS
This unit should be burned under moderate conditions that produce a fire severity low enough to retain over-story trees, but high enough to open up the under-story, reduce the dead biomass and minimize smoke. Characteristics are based on a head fire.

Characteristics	Range
Rate of Spread (chains/hour)	1.5-12.5
Flame Length (feet)	1.4-3.6
Fireline Intensity (btu/ft/s)	11-89

K. IGNITION AND HOLDING ACTIONS

All personnel will attend briefing prior to burn. Tactics and assignments will be covered. Lookouts, Communications, Escape Routes and Safety Zones will be discussed. Individual job assignments and instructions will be given to each crew-member. Maps, firing and contingency plans will be made available to each crew-member.

Firing and Ignition:
A test fire will be set near the tower at point 1 (see appendix 3). Both ignition teams and all holding resources will be located at the test fire site. After test fire, a two-person ignition team (Group D) will ignite the central ridge starting near Point 11 and light towards the tower (Point 1). At the same time, one ignition team will black-line the top part of the burn near the tower and roads. Coordinated perimeter ignition will then take place down White Oak Hollow and Kelley Hollow. After significant progress has been made, another ignition team (Group D) will ignite Terrapin Hollow. All three-ignition teams should reach the bottom of the unit at the same time then finish by igniting the bottom from Points 3-5 and Points 7-5. Close coordination via radio will be necessary between ignition and holding personnel to ensure that the operation proceeds safely and efficiently.

Firing Sequence:
Refer to Appendix 3 for a map illustrating the ignition sequence.

If prescription parameters are exceeded during project execution, the Burn Boss should terminate ignition operations at a safe and appropriate location based on fire behavior, fuels topography and weather conditions. If the project area comes back into prescription based on current and forecasted weather, ignition operations may continue. If not, the project area is put into a mop-up and patrol status. Holding actions shall maintain control of the fire until a decision to continue, postpone or extinguish the prescribed fire is made and the Agency Administrator or their designee is notified. The Burn Boss will document this decision process on a unit log.

Holding Actions:
Each division will have ignition and holding personnel. Holding teams will secure the fire line with engines, ATV's and hand-tools. Engines and water carrying ATV's will patrol behind ignition teams lighting from roads and trails. Water sources (drafting sites, etc.) will be identified on the project map.

Mop-Up Operations:
Mop-up will occur only for the purpose of maintaining control of the burn. Jackpots, snags, or problem areas will be secured through the use of water or foam. Chainsaw and handtools will only be used when other methods are not practical.

L. WILDLAND FIRE TRANSITION PLAN

1. Stage an MDC dozer within a ten-minute response time prior to ignition. Coordinate with Eminence District Forester.

2. The secondary lines will be Kelley Creek on the east, The Ozark Trail on the southeast, Rocky Creek on the north and northwest and the woods trail out Mule Mountain south of White Oak Hollow.

3. Minor Escape-Spot fires and slop-overs that fall within the secondary lines and are controllable with hand crews-holding crews will suppress spot fires or slop-overs, and ignition may continue.

4. Major Escape-Spot fires regardless of location that can not be fought with hand crews. On NPS land, the NPS Burn Boss will be IC. On state lands, the MDC Burn Boss will be IC. The Burn Boss will notify **MDC-Eminence (573-226-3616), USFS-Winona (573-325-4143) and NPS-Van Buren (573-323-4236 ext.233)** and request for state dozer and crews if needed. An ICT3 will be available through the Forest Service in Winona.
5. If the escape cannot be contained within 1 burning period by on-site personnel, the fire will be converted to a wildland fire and resources will be ordered as needed by the IC.
6. The Burn Boss will coordinate safety considerations with the section leaders (Holding, Ignition, and Monitoring) to provide and ensure the safety of ALL personnel assigned. All personnel will be assigned holding or suppression duties.

M. PROTECTION OF SENSITIVE FEATURES

The fire tower and adjacent radio building will be protected with a wet line and a black line around their perimeters. The NPS Historian will do an on-site inspection for cultural resources on NPS lands. If any cultural or historical areas are found to be in the unit, burn personnel will be notified and measures will be taken to protect those areas.

N. PUBLIC AND PERSONNEL SAFETY

1. A safety briefing will be given at the pre-burn briefing and at the start of each operational period. All personnel will be advised of Lookouts, Communications, Escape Routes, and Safety Zones. Any other potential safety hazards will be pointed out and mitigated as soon as possible upon identification of hazard.

2. All NPS burn personnel will wear standard firefighting personal protective equipment (leather boots, leather gloves, Nomex Clothing and hard hat). They will carry a fire shelter and fire tool at all times. MDC personnel will adhere to that agency's requirements for PPE.

3. Only red-carded personnel or cooperators who meet their own agency's qualifications will be utilized during the burn.

4. All standard wildland firefighter safety rules will be strictly enforced (ref: Fireline Handbook).

5. H Highway and NN Highway will be signed to warn motorists of smoke along the road. If necessary, a road guard will be placed on the road to slow traffic. Visibility will be monitored on the highways during the burn and also after dark.

6. The public will be kept at a safe distance from the fire lines.

7. Escape Routes and Safety Zones will be identified prior to the burn.

8. EMERGENCY MEDICAL PROCEDURES:

- EMT or First Responder assigned the day of the burn.
- First Aid equipment available and location made known to all burn personnel.
- Burn Boss notified immediately of injury.
- Burn Boss will coordinate with EMT/First Responder.
- Burn Boss will notify Park Dispatch of an injury and will follow up with information as soon as the injury has been assessed.
- EMT/First Responder will assess injury and begin treatment.
- Once injury has been assessed, the Burn Boss or designee will activate the appropriate EMS response for evacuation of injured personnel.
- If personnel need to be evacuated, park dispatch will dispatch/contact EMS resources from the following table:

RESOURCE	CONTACT PHONE NUMBER	LOCATION
Eminence Ambulance/Sheriff Winona Ambulance	573-226-3615 800-262-3477	Eminence, MO Winona, MO
St. Francis Hospital	417-934-2246	Mtn. View, MO
Life Flight Dispatch Air Evac 1	800-247-3822	 West Plains, MO

O. SMOKE MANAGEMENT AND AIR QUALITY

This area is remote with few nearby residences. The nearest towns are Eminence 10 miles NW, Winona 8 miles SW, Ellington 17 miles NE, Bunker 25 miles N, Fremont 10 miles S and Van Buren 12 miles SE. One person will periodically check H and NN highways to ensure at least 1.5 miles visibility is maintained.

COMPLIANCE:

In the state of Missouri, prescribed fire is considered to be agricultural burning and there are no burn or smoke permit requirements to ignite a prescribed burn. However, agency standards require meeting minimum requirements for mixing height and transport winds. The minimum mixing height is 1500 feet and a minimum transport wind of 9 mph. A smoke management forecast will be obtained the day of the prescribed burn and attached to the plan.

MODELING:

A smoke projection map is attached for all proposed wind directions.

MITIGATION:

Smoke production will be light to moderate, but will lift and disperse adequately as long as the burn is conducted within smoke management guidelines.

P. INTERAGENCY COORDINATION AND PUBLIC NOTIFICATION

1. The park Fire Education, Prevention and Information Specialist will handle press releases a minimum of two (2) days before the burn. Generally a single media release made prior to the particular burn season (fall or spring) suffices.

2. Fire management staff will notify the following at least one week prior to the proposed ignition date:
   - Park Superintendent
   - Senior Management Staff & District Rangers

3. NPS Fire management staff will notify the following at least two days prior to the proposed ignition date:

Missouri Department of Conservation	573-226-3616
USFS	573-325-4233
MOCC in Rolla, MO	573-341-7484
MWRO (Connie Burns)	402-221-3476
National Weather Service – Paducah, KY	502-744-0321

MDC Burn Boss will contact local landowners, The Nature Conservancy and local volunteer fire departments (Eminence and Winona).

**Notifications are to be made the day of the burn, the day before by either the Burn Boss, Fire Program Clerk, Fire Management Officer or designated person. Notifications will be recorded into dispatcher's log and on the original burn plan with the time, date and agency/person notified.

AGENCY/PERSON CONTACTED	DATE	TIME	CONTACTED BY

Q. MONITORING AND EVALUATION PROCEDURES

The monitoring will include fire weather; fuel moisture; fire behavior; burn emissions; post fire effects on vegetation; and a video tape of burn at one hour intervals from Stegall Tower area (unless MDC films the burn from a helicopter).

Fire weather monitoring will include comparison of spot weather forecasts with on-site observations for wind speed and direction, temperature, and relative humidity taken every hour while the burn is in progress.

Fuel moistures for 10 hour fuels will be collected and dried to determine fuel moistures. On-site readings will be compared with fuel stick moistures at the Big Springs Automated Weather Station on at least 3 days prior to the burn.

Several agencies including the NPS, MDC, NBS, University of Missouri and Washington University have extensive monitoring plots located on Stegall Mountain. The following is a list of fire monitoring projects that are occurring:
Alan Rebertus and Richard Guyette-Fire history, Ecotones, landscape patterns, tree morality and recruitment
Gary Wilson-Same
Dr. Templeton- Collared lizards
Dr. Van Gilder-Turkeys
Lisa Thomas-Herbaceous species response
Before ignition of the burn unit begins, an on-site weather observation will be taken no more than 30 minutes prior to ignition. The burn boss or designated person will be responsible for obtaining a fire weather and smoke management forecast for the day of the burn.

The nearest associated NFDRS/WIMS station is at Van Buren (#031201). Outputs from this station will be tracked, beginning at least one week prior to the proposed ignition date. Spot weather forecasts will be requested prior to the burn and each consecutive day of the burn from the **Paducah, KY NWS** office (502-744-0321). Actual on-site weather information will be reported back to the weather forecaster to help improve the forecasts during the burn.

Burn emissions will be monitored by mapping plume trajectory at least three times during the burn. Background visibility will be estimated directly downwind in miles from Stegall Tower prior to and after ignition is completed.

POST-BURN:

Post burn monitoring will occur as Resource and Fire Management staff in consultation with Midwest Region and Ozark Ecoregion Fire Ecologists determines the need.

R. POST FIRE REHABILITATION

"Light Hand on the Land" guidelines will be used to help minimize rehab needs. The following list of standards for the rehabilitation burn units can be adjusted for specific burn unit needs.

1. Flush cut stumps.
2. Remove flagging.
3. Build water bars on fire lines that are located on steep slopes.
4. Cover firelines to blend in with surrounding vegetation **after** the fire has been declared out.
5. Repair or stabilize damage to road shoulders.
6. Snag hazard trees at the discretion of the burn boss and holding specialist.

7. Close all access created by fire personnel and equipment.
8. Any other rehab as directed by appropriate Resource Management personnel.

No special rehab needs are anticipated for this burn unit.

S. POST FIRE REPORTS

Post fire reports shall be the responsibility of the burn boss and should be submitted within seven (7) days of the completion of the burn to the Ozark National Scenic Riverways Fire Management Office. The Fire Management Officer and Fire Program Assistant (FPA) will incorporate any long-term monitoring data or reports into the burn documentation package as they come available. The FPA will be responsible for entering required prescribed fire reporting information, including the 1202 and employee experience records, into SACS when they become available.

APPENDIX #2
REVIEWERS' COMMENTS

Fire Management Officer:
This plan has been updated to reflect FY2006 dates and costs. My name appears on two signature lines. I reviewed the original plan as the MWR fuels specialist and now I am the FMO for Ozark NSR.

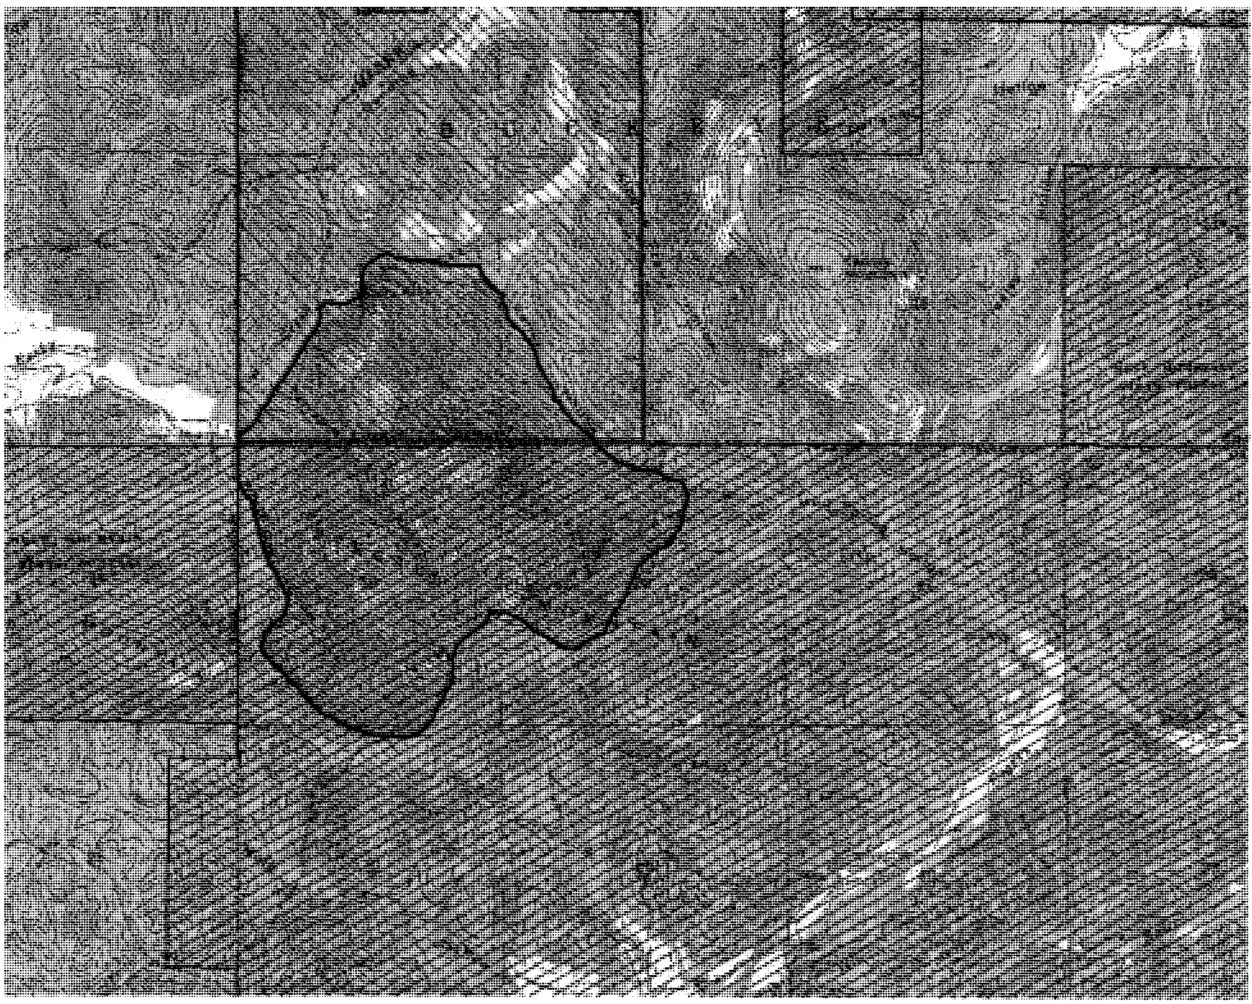
Chief Ranger:

Chief of Natural Resources:

Park Superintendent:

APPENDIX #3

ATTACH MAPS HERE



APPENDIX#4
Stegall Mountain Prescribed Fire
Hazard Rating Guide

Hazard Element	Hazard Probability L	Hazard Probability M	Hazard Probability H	Potential Consequences L	Potential Consequences M	Potential Consequences H
Environmental Data						
a. Seasonal severity	Energy Release Component below 90th percentile levels.	Energy Release Component at or above 90 th percentile levels – above average drought conditions.	Energy Release Component at or above 97th percentile levels – severe drought conditions.	Low probability for problematic fire behavior or difficulty in holding activities.	Some potential for problematic fire behavior or difficulty in holding activities.	High probability problematic fire behavior and difficulty in cont
b. Fire Behavior	Flame lengths confined to surface fuels, spread rates low.	Flame lengths extending into shrub and tree regeneration, spread rates moderate.	Flame lengths highly variable, frequently involving individual tree crowns, spread rates moderate to fast.	Low probability of difficulty in holding fire or for adverse fire effects.	Some potential for fire behavior to approach upper prescription limits and cause undesirable effects.	High potential fo fire behavior to create holding problems, exce prescription ranges, and cau undesirable effe
c. Fuels	Surface fuels light with open tree canopies, small shrub component present.	Surface fuels moderate with variable forest stand density and moderate shrub presence.	High surface fuel loading with dense shrub component and dense stands with abundant regeneration.	Fuels present no specific implementation problems.	Fuels will have a marked effect on implementation activities and holding force requirements.	Fuels will dramatically aff management organization an qualifications fo implementation
d. Weather	Weather stable, winds light and predictable, no frontal activity.	Weather slightly variable, winds present but light, occasional gusts, no frontal activity.	Weather highly variable, winds near prescriptive limits, gusts prevalent, frontal activity possible.	Little impact on implementation.	Weather variation will require mitigation actions involving additional resources.	Weather will se as a major influence on organization, personnel qualifications, a specific implementation actions.
e. Topography	Low variability in slope and aspect.	Some variability in slope and aspect, will affect fuel moisture and fire behavior.	High variability in slope and aspect, major implications on fire behavior and must be considered in prescription development and implementation.	Little influence on burn implementation.	Consideration of topography during planning process is necessary.	Topography wil necessitate mitigation actio to be develope and firing patte and ignition methods to be modified to redu impacts.

192

Agency Values						
a. Ecological and Environmental Considerations	Fire poses little threat to cause adverse effects or long- term disturbances to natural resource values. No T and E species or critical habitat.	Fire poses moderate threat of adverse effects on natural resources and may cause short- to mid- term alterations or inconveniences such as air quality. Small amounts of T and E species present.	Fire poses high potential for adverse effects to natural resource values or to cause long- term degradations in air quality. Some T and E species present and/ or critical habitat.	Low probability for adverse impacts and little need for mitigation actions.	Mitigation actions may need to be developed to ensure desirable outcomes. Some short- term effects may have to be accepted.	Prescribed Fire Plan must addre mitigation actior to prevent undesirable outcomes.
b. Social and Cultural Values	No known social or cultural values in or adjacent to the project area.	Features of social or cultural value have been identified in and adjacent to the project area. Mitigation measures can be accomplished.	High social or cultural values have been identified in or adjacent to the project area. Mitigation actions are difficult to accomplish.	Severe fire behavior or fire outside the unit would not damage the identified values.	Severe fire behavior or fire outside the unit poses potential for moderate damage to special values. Concerned parties are aware and supportive of the project.	Excessive fire severity or fire outside the unit have adverse effects (substan damage to or potential destruction of th special sites). Acceptance by concerned parti is low.
c. Project Duration and Logistics	Fire planned to be of short duration, logistical needs easily accommodated.	Fire planned to be of short to moderate duration, logistical needs pose some difficulty.	Fire planned to be of moderate to long duration, logistical needs create much difficulty in accomplishing.	No consequences because of duration or logistics.	Duration may impact firefighters and public and logistical needs must be specifically addressed.	Long duration fi necessitates greater informat dissemination, mitigation to remove impacts firefighters and t public, and logistical needs must be met or project postpone
d. Smoke and Air Quality Management	Few smoke sensitive areas near project area. No potential scheduling conflicts with cooperators.	Multiple smoke sensitive areas, mitigation actions minimize impacts, low potential for scheduling conflicts.	Multiple smoke sensitive areas near burn area, mitigation actions unable to remove all impacts, duration increases impacts, high potential for scheduling conflicts.	No adverse smoke consequences.	Mitigation actions must address smoke impacts, and coordination is required to confirm scheduling.	Mitigation actior must be develop regulatory agen must concur, scheduling confl may restrict implementation.

Hazard Element	Hazard Probability			Potential Consequences		
	L	M	H	L	M	H
Public Values						
a. Land use values	No commercial or agriculture activities near planned burn area.	Some commercial or agricultural activities near burn unit, some managed wildlands (recreation, timber, range values).	Planned burn directly adjacent to urban, commercial, and/ or agriculture areas.	No impacts from land use values.	Escaped fire onto nearby managed land causes some impacts to commercial values. Prescribed Fire Plan must consider actions to prevent fire movement onto commercial and/ or agriculture lands.	Escaped fire on nearby manage land causes significant impa to commercial values. Mitigatio actions must ref additional resou needs to protec urban, commerc and/ or agricult areas. If mitigati cannot be accomplished, b must be postponed.
b. Dwellings	No permanent or part-time residences present in area.	Some residences ½ mile or less from burn area.	Planned burn is located in wildland-urban interface zone, permanent residences in close proximity.	No impacts from dwellings.	Plan must address actions to ensure adequate protection of residences.	Notification of a concerned homeowners, residents, and visitors, coordination wit local fire protect organizations is needed, and mitigation actior must adequatel address potenti fire escapes.
c. Non-dwellings	No non- dwellings present.	Some outbuildings and non- residences ½ mile or less from burn area.	Commercial structures in close proximity to burn area.	No impacts.	Planning must consider these non- dwellings.	Planning and implementation must adequatel address all measures to prevent any adverse impact

Human Factors						
a. Firefighter	Little firefighter exposure.	Some firefighter exposure due to fire duration and smoke.	Potential for high firefighter exposure to smoke during burn and to fire during holding actions.	No specific problems, implement standard safety measures.	Mitigation measures to eliminate smoke exposure.	Mitigation measures must address smoke exposure, use o mechanized equipment to eliminate expos to fire.
b. Public	No public exposure.	Some public exposure, mitigation actions can remove/ minimize exposure.	Public may be exposed to high smoke concentrations for moderately long periods, especially during nighttime hours.	No adverse consequences anticipated.	Mitigation actions necessary to provide for maximum public safety.	Mitigation actior must be develop coordinated with other emergenc organizations ar fully understood prior to ignition.
c. Fire Management	No problems with commitment and acceptance by park staff members.	No problems with commitment but some unwillingness to support and prioritize the prescribed fire over other activities.	Park staff not committed to using prescribed fire as a tool and not willing to support and prioritize prescribed fire over other activities.	No adverse consequences.	Park staff must be briefed on need and importance of prescribed fire.	Park manageme team must be informed of prescribed fire objectives, supp needs, and prio

FIRE MODELING OUTPUTS (Fuel Model 9)

APPENDIX #6
AGENCY ADMINISTRATOR
GO/NO-GO PRE-IGNITION APPROVAL

Prescribed Fire Name: Date:

A) Instructions
The Agency Administrator's Go/No-Go Pre-Ignition Approval is the first of two GO/NO-GO decisions that must be completed before a prescribed fire can be implemented. The Agency Administrator's Go/No-Go Pre-Ignition Approval is the final management approval prior to execution of the prescribed fire and evaluates whether compliance requirements, prescribed fire plan elements, and internal and external notifications have been completed. The Agency Administrator's Go/No-Go Pre-Ignition Approval is valid for 30 days. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval will be required.

B) Key Elements
1. Is the prescribed fire plan up to date?
   Hints: changes, amendments, seasonality.

2. Have all compliance requirements been completed?
   Hints: cultural, threatened and endangered species, smoke management.

3. Is risk management in place and the residual risk acceptable?
   Hints: Prescribed Fire Mitigation Table and Prescribed Fire Complexity Rating Guide completed with rationale and mitigations identified.

4. Will all elements of the prescribed fire plan be met?
   Hint: preparation work, mitigation, weather, organization, prescription.

5. Have all internal and external notifications and media releases been completed?

6. Are key park staff fully briefed, and understand the implementation of the prescribed fire?

7. Other?

Prescribed Fire Operations
GO/NO-GO Checklist

Prescribed Fire Name: Date:

	YES	NO
- Has Agency Administrator GO/NO-GO Pre-Ignition Approval been approved?		
Narrative/Comments:		
- Are current and forecasted weather conditions favorable for execution of the prescribed fire? (hints: spot weather, dialogue with fire weather forecaster, climatological analysis complete)		
Narrative/Comments:		
- Have all key personnel listed on the Incident Action Plan (IAP) been briefed with an opportunity to give feedback? (hints: safety, objectives, assignments)		
Narrative/Comments:		
- Has all pre-burn preparedness work been completed? (hints: fuels and weather observations, signs, closures, smoke management, unit preparation)		
Narrative/Comments:		
- Are all equipment and supplies required in the prescribed fire plan in place and functional? (hints: pumps, radios, ignition devices, hose lays, vehicles, aviation, etc.)		
Narrative/Comments:		
- Are all holding resources described in the IAP committed and can be on-scene within specified time frames?		
Narrative/Comments:		
- Are all personnel certified for their assigned positions? (hints: Check Red Cards)		
Narrative/Comments:		
- There are no extenuating circumstances that preclude successful completion of this project? (hints: regional & national preparedness, unusual circumstances, unusual drought, outstanding issues, other fires, recent fire escapes, etc.)		
Narrative/Comments:		
IF ALL BOXES HAVE BEEN CHECKED "YES" YOU MAY PROCEED WITH THE TEST FIRE.		

	YES	NO
TEST FIRE DOCUMENTATION AND RESULTS:		
- Observed Fire Behavior within Prescription?		
Narrative/Comments:		
- Test fire was successful?		
Narrative/Comments:		
- Are all prescription parameters in the prescribed fire plan favorable for implementing the project? (hints: each plan element, pre-burn, smoke management, cooperator coordination)

IAP/BRIEFING GUIDE

I. Present Handouts

- **A. Map of Burn**
- **B. Organization Chart**

II. Describe Area Of Burn

- **A. Vegetation Type**
- **B. Acreage**
- **C. Slope**
- **D. Roads/Access**
- **E. High Values at risk**
- **F. Water Sources-natural, tanker and hydrants**
- **G. Natural/Manmade barriers**

III. Weather Forecast- Use National Weather Service "Forestry" and "Smoke Management" Forecasts for applicable Zones. Use "Fire Weather Special Request" Form if updates are deemed necessary.

- **A. Wind direction and Speed**
- **B. Relative Humidity**
- **C. Temperatures**
- **D. Predicted Changes**

IV. Organization

- **A. Organization Chart – Location on Map**
- **B. Equipment - tankers, refueling, etc.**
- **C. Fire Monitoring**
- **D. Any other resources**
- **E. Transition Fire Plan**

V. Firing Sequence

- **A. Test fire**
- **B. Type and Sequence of Firing**

VI. Radio Assignments

- **A. Given Day of Burn**
- **B. Communication Plan**

VII. Safety

- **A. Winds**
- **B. Escape Routes and Safe Zones**
- **C. Hazards – crew and equipment (wildlife, research plots, trash, etc.)**
- **D. Personal Protective equipment (PPE)**
- **E. Refueling – fuel handling, gloves, spilling, etc.**
- **F. Activation of emergency and headlights on major roads**
- **G. Other public safety considerations**

VIII. Comments and Questions Period

APPENDIX #9

ADEQUATE HOLDING RESOURCES WORKSHEET

Project Name: Stegall Mountain RX Fuel Models Inside Project Area: 9

Prepared By/Date: Scott Bressler 09-14-01 Fuel Models Outside Project Area: 9

Characteristics	Output type	Modeling Predictions Inside Project Area	Modeling Predictions Outside Project Area	Unit of Measure
CRITICAL FIRE INPUTS	1 Hr Fuel Moisture		5	%
	Wind Speed		5	MPH
	Slope		45	%
KEY FIRE BEHAVIOR OUTPUTS	Rate of Spread		13	ch/hr
	Fire line Intensity		89	BTU/ft/sec
	Flame Length		3.6	Feet
	POI		60	%
	Spotting Distance			Miles
	Scorch Height			Feet
FIRE SIZE	Projection Time		1	Hours
	Forward Spread		12.5	Chains
	Backward Spread		0.6	Chains
FIRE CONTAINMENT	Method Of Attack		Rear	Head/Rear
	Max Escape Target		200	Acres
	Max Containment Time		10.5	Hours
	Total Line Building Rate		28	Ch/hr

1. Choose worst case total line building rate above that is needed for containment of slop over or spot fire : 28ch/hr
2. Estimate potential number spot fires or slop overs at on time: 1
3. TOTAL LINE BUILDING RATE NEEDED (multiply line 1 times line 2) 28ch/hr
4. Production Rates: Ease of Access: POOR-FAIR-GOOD-EXCELLEN(circle)
   Fuel Resistance to Control LOW- MODERATE-HIGH-EXTREME(circle)

(refer to fire line handbook) Hand Crew Production 8 ch/hr
Engine Production (Crew of 2) 25 ch/hr
Dozer Production (Type ___) ch/hr

On Site Organization	Total # Planned On Burn	Total # Available for Spot Fire or Slop Over Control		Line Building Production Rates		Spot Fire or Slop Over Line Building Capacity
Overhead	6	3	X	8	ch/hr	24
Firing Crew	10	4	X	8	ch/hr	32
Holding	15	6	X	8	ch/hr	48
Other Personnel			X	8	ch/hr	
Engine (Crew of 2)	2	1	X	25	ch/hr	25
Dozer (Size)			X		ch/hr	
Other Equipment			X		ch/hr	

5. **TOTAL SLOP OVER OR SPOT FIRE LINE BUILDING RATE CAPACITY 124 ch/hr**

6. DETERMINATION OF ADEQUATE HOLDING RESOURCES (Line 5 minus Line 3) 96 ch/hr

If number on line 6 is positive then adequate holding forces will be available. If number is negative, more holding resources are needed to control potential spot fires or slopovers.

APPENDIX #10
POST-PROJECT EVALUATION

Instructions for Completion of Post-Project Evaluation Form

This form is to be completed and submitted for review within 30 days of declaring the project complete.
Block 1 Self-explanatory
Block 2 Copy of the Project Objectives as listed in the Project Plan.
Block 3 Give quantitative results of how well objectives were met, i.e. % of 1 hour and 10 hour fuels removed, % of burn area with fuels reduced, % of area with acceptable/unacceptable scorch, etc.
Block 4 Give a short narrative of problems encountered and suggestions for improving or refining operations and prescriptions i.e. firing pattern, equipment limitations, drought index, effectiveness of barriers.
Block 5 Self-explanatory - for providing feedback to the Program

Title: Foreman Office: Buffalo NR

REVIEWERS' COMMENTS

Fire Management Officer:

Chief Ranger:

Chief of Natural Resources:

Park Superintendent:

Regional Review:

The Project map is missing. One needs to be made with all relevant information such as: burn units, water sources, roads, and structures.... This map needs to be made before Prescribed Burn and distributed to burn personnel. I approve of the Holding Forces Worksheet Justification, as long as conditions are as stated, on burn day. Found a typo on pg 55, Prescribed Fire Risk Analysis Worksheet. 1d Weather, the risk should be M.

Plan meets NPS standards

Table of Contents

B. EXECUTIVE SUMMARY

This burn supports the park's broad historic landscape restoration efforts to reestablish native plants and open savanna found during the civil war battle on August 10, 1861, for which the park was established. This project is part of continuing sequence of entry and maintenance burn projects to restore this historic landscape. The park brochure (1992) entitled "A Guide to Historic Landscape Restoration" reads:

> *"Prior to European settlement, savanna covered one third of Missouri. Today, only a few remnants of original savanna remain. Reestablishing an example of this unique biological community is not only an investment in our future but will, with time, recreate the 1861 landscape that was the stage for this important battle."*

This project also supports the following specific objectives found in the park Fire Management Plan:

- To utilize prescribed fire as a professional management tool to restore and perpetuate the natural environment and its processes and the historic scene. Initially, the park may implement prescribed burning for savanna restoration and preservation. Ultimately, as research provides the necessary knowledge and management recommendations, prescribed fire use are envisioned to be utilized for other management purposes.
- To research the proper role and effects of fire upon the park's natural and affected historical resources to provide management recommendations.

C. DESCRIPTION OF PRESCRIBED FIRE AREA

GENERAL AREA: The area is flat to rolling grasslands and hardwood timber with Wilson's Creek bisecting the park through the center from north to south.

LOCATION:

Legal:

1. T 28 N, R 23 W, SEC 23
2. Latitude N 37 07' 07" (37.1185)
   Longitude W 93 25' 04"(93.4178)
3. UTM Zone 15, Easting 462883. Northing 4108105.

Fire Management Zone: Suppression.

District: N/A .

GEOGRAPHIC ATTRIBUTES:

Size: SW-1: 56.6 acres
SW-2: 124.1 acres
NW-5: 6.7 acres
NE-6: 25 acres
NE-7: 73.3 acres

Elevation Range: 1080 to 1250 ft.

Slope Range: 0-10 %.

Aspect Range: Both burn units are fully exposed with a southern to western aspect.

DESCRIPTION OF PROJECT BOUNDARIES:

NW-5: The eastern boundary is Wilson's creek and the northern line is the park boundary. On the south the unit is bordered by the tour road and to the west a mowed line.

NW-6: The unit is bordered by the tour road to the south and on the west a maintenance road. The northern boundary is a paved county road and on the east a mowed line.

NW-7: This unit is surrounded by paved roads to the north, south and east. On the west side, the unit is bordered by Wilson's creek.

SW-1: The northern boundary is a creek and the tour road. On the east and south, the unit is bordered by a service road. The western boundary is the park boundary and ZZ highway.

SW-2: The northern boundary is a service road. On the east, the unit is bordered by a mowed field. The southern boundary is a tram road and on the west is the park boundary and ZZ highway.

VEGETATION DESCRIPTION:

The unit is 88% fuel model 3 and 12% fuel model 9. Located within each burn unit are small pockets of hardwood timber less than 1 total acre. The fuel model surrounding the burn units is Fuel Model 1. This is indicated in the Holding forces worksheet. Fuel Model 1 is used to calculate holding resources. The area surrounding the park is pastureland with some residential areas with manicured lawns. The pasture lands surrounding these units are severely grazed with grass of less than 2 inches at this time of year. A justification to the holding worksheet for a lower number of holding resources will be added in that Fuel Model 1 will grossly over predict rate of spread and fire line intensity.

Vegetation Type	Fuel Model NFFL	Estimated Acres	Estimated Tons Per Acre
Short/Tall Grass	1/3	577	2 - 6

PROJECT MAP (Appendix #1) The burn boss will assign points on the map for ease of communication while units are burned.

VICINITY MAP (Appendix #1)

D. GOALS AND OBJECTIVES

GOALS

1. Provide for Firefighter safety.
2. Reduce wildfire risk to urban interface improvements immediately outside of the park boundary, as well as historic park improvements,
3. Restore fire and associated natural processes in order to retain tall grass prairie species composition and hardwood savannas, characteristic of the park's historic natural communities an average of 10 to 12 oak trees per acre.
4. Provide training opportunity for firefighters

SPECIFIC OBJECTIVES:	PROPOSED REDUCTION WITHIN ONE YEAR	ACTUAL RESULTS
Burn unit with a moderate severity burn.	75-95%	
Reduce 1-hour fuel loading (litter layer).	50-80%	
Reduce 10-hour fuels.	40-70%	
Top-kill of saplings greater than 1.4 meters tall and less then 2.5 meters tall in the forested areas and where hardwoods are encroaching in historic open fields.	>40%	

Range of Acceptable Results Expected across the Project Area

Throughout the entire unit a mosaic of different levels of fire severity are desired and acceptable.

E. RISK MANAGEMENT

This burn project has a low risk value as calculated by the hazard risk analysis process. Assessing reasonable risks and the mitigation to lower these risks generates this low rating. This is documented on the Hazard Rating Guide, Prescribed Fire Risk Analysis Worksheet, and Job Hazard Analysis.

F. PROJECT COMPLEXITY

This burn rates as a low complexity project that should pose no unusual risks to personnel safety or property. Burn duration will be 8 hours or less both units combined.

HAZARD, RISK AND COMPLEXITY WORKSHEETS (attached)

G. ORGANIZATION

The Burn Boss may order additional resources to assist with the project before ignition if in their professional judgment, they are needed. This may be done after consultation with the project coordinator or Ozark Fire Management Officer. All non-park resources will be ordered and committed to the prescribed fire project through the Missouri Interagency Dispatch Center (MOCC). The holding resource worksheet and Fireline Handbook will be used to determine adequate number and type of holding resources for each scenario. Specific resources will be identified in an incident action plan prepared prior to each operational period during the implementation of the burn. It is anticipated that one or both Mid-west Fire Use Modules will be used. The regional office will provide a burn boss if Ozark NSR or Buffalo NR can not.

A total of Fourteen (14) persons will be the minimum required conducting the prescribed fire.

Overhead Personnel:
1 Burn Boss/ Incident Commander (RXB2)(The Burn Boss can serve as Ignition Specialist)
1 Holding Specialist (Single Resource Boss Qualified or higher)
1 Fire Effects Monitor

Additional Crews/Personnel/Resources For Daytime Holding and Ignition Operations:
3 FFT2 – Ignition Crew
2 Type 6 engines with operator and asst. operator
4 ATVs with Water Tanks and operators

H. ESTIMATED PROJECT COSTS (non-base, other agency, contract):

Costs will be primarily for personnel and equipment preparing and conducting burn operations. The unit requires some preparation. Firing operations and post firing patrols should be of short duration with the goal of keeping overall costs low.

FUNCTION	PROJECTED WORK HOURS/	PROJECTED COSTS*
Planning	10 hours (base salary paid) Rx Fire Plan development	$0.00
Unit Preparation	20 hours blow line, hazard tree mitigation, brush hog line	$4000.00
Operations (including burning, holding, mop-up)	50	$2500.00
Travel	12 people (includes per diem and lodging) X 4 days	$6000.0
Monitoring & Evaluation	2 (collateral assignment) site visit coordination between WICR staff and FMO.	$200.00

TOTAL PROJECTED COST _$ 12,700.00__ divided by 285.7_ acres = $ 44.45 PER ACRE
*Required information in final report: ACTUAL COSTS, COST PER ACRE, WORK HOURS PER ACRE.

I. SCHEDULING

Proposed Ignition Date:	March to Nov. 2005
Projected Burn Duration:	1 day total
Actual Ignition Date:	
Date Declared Out:	
Date DI-1202 Submitted:	

J. PRE-BURN CONSIDERATIONS

ON SITE PREPARATION NEEDS:

A. Construct a 6-8 foot wide mow line in grass along the park's boundary.

B. Mow a 3 foot clear diameter around each power pole within the units and remove the thatch from mowing. The thatch to be thrown into the unit.

C. Foam the Edwards Cabin the day of the burn and have a 8 to 10 foot mowed line in place.

D. Prepare 20 gallons of burn mix.

E. Access the nearest remote automated weather station at least two days prior to the ignition date to assess fuel moisture and weather conditions.

F. Take fuel moisture samples from the site and calculate % fuel moisture for 1-hr. fuels one day prior to the burn.

G. Set-up four all-terrain vehicles outfitted with water tank and pump and one all-terrain vehicle outfitted for patrol. Transport ATVs to burn site.

H. DAY OF BURN: Set up "Prescribed Burn" and "Smoke" signs along the Tour Road, Wire Road, ZZ Highway and Route 182.

I. Fill at least 4 bladder bags and place on the engines.

J. Program handheld radios for frequencies identified in the Communications Plan (Appendix #17).

OFF SITE:

A. WICR staff will purchase needed equipment and supplies.

B. WICR staff will notify local fire departments of the scheduled burn and their role.

C. WICR staff will complete a press release at least one week prior to the proposed burn in the local newspaper.

D. At least a week prior to the burn, WICR staff will contact the adjacent landowners with a press release of the proposed burn.

SPECIAL PRECAUTIONS/REGULATIONS:

A. All improvements (power poles, traffic and park signs) will be cleared around of fuel prior to the burn.

B. Smoke Ahead signs will be placed along ZZ Highway and Route 182.

Safety Hazards: Visitor safety; smoke on Route 182 and Hwy. ZZ and along control lines. Crew safety; safety zones, visibility, and exposure to smoke. **Mitigation:** The area, including all trails, will be closed while burning. Visibility on roads will be monitored and controlled. "Smoke Ahead" and/or "Prescribed Burn" signs will be posted. Strip burning may be used to increase heat to reduce smoke output. All personnel will have PPE. Escape routes and safety zones will be identified. Engines and Atvs will have headlights on.

K. PRESCRIBED FIRE PRESCRIPTION

NFFL Fuel Models used: 1 & 3
Fuel Model 3 for the burn unit and Fuel Model 1 for fuel surrounding the burn units.

BURNING PRESCRIPTION AND OBSERVED CONDITIONS:

Prior to ignition, compare prescription elements, both individually and collectively, against local weather forecasts and any other predicted conditions. During implementation of the burn, if objectives are not being met, further ignition shall be evaluated; therefore, prescription parameters must be wide to accommodate established objectives while staying within fire personnel capabilities. All changes to the prescription parameters must be approved with same level of authority required for the plan approval.

The prescription is based on fuel moisture, wind speed and relative humidity. Temperature ranges will not be used as a constraint.

Fuel Model 3

ENVIRONMENTAL VARIABLES	HOT	OPTIMUM	COOL	OBSERVED*
Relative Humidity (%):	20	30	50	
Wind Direction:	S/SW to N/NW	S/SW	S/SW to N/NW	
Wind Speed (midflame):	8 mph	4 mph	2 mph	
Dead Fuel Moisture (%) 1 Hour:	5	8	10	

*At time of ignition

PREDICTED FIRE BEHAVIOR	HOT	OPTIMUM	COOL	OBSERVED*
Rate of Spread (ch/h):	235	78	30	
Fireline Intensity (Btu/ft/s):	3369	980	370	
Flame Length (ft):	18.9	10.7	6.8	

*Standard observation time

See Appendixes for BEHAVE Projections

Fuel Model 1

ENVIRONMENTAL VARIABLES	HOT	OPTIMUM	COOL	OBSERVED*
Relative Humidity (%):	20	30	80	
Wind Direction:	S/SW to N/NW	S/SW	S/SW to N/NW	
Wind Speed (midflame):	8 mph	4 mph	2 mph	
Dead Fuel Moisture (%) 1 Hour:	5	8	10	

*At time of ignition

PREDICTED FIRE BEHAVIOR	HOT	OPTIMUM	COOL	OBSERVED*
Rate of Spread (ch/h):	256	53	10	
Fireline Intensity (Btu/ft/s):	434	81	11	
Flame Length (ft):	7.7	3.4	1.4	

*Standard observation time

See Appendixes for BEHAVE Projections

Behave Projections

Fuel Model 3 is used for predictions within the units and Fuel Model 1 outside of the unit. The fuels outside of the burn unit are mowed hay fields and hardwood forest. All units will be surrounded by fuel model 1. **Note:** The high fire intensities and rate of spreads predicted will be interior in each unit. This will be mitigated by the burn boss with firing patterns and sequences. During black lining operations, fire intensities will be low due to burning on the low end of the prescription and the fact that intensities are over predicted in these blocks.

L. IGNITION AND HOLDING ACTIONS

The Burn Boss or Ignition Specialist will thoroughly describe the firing plan and safety considerations to all burn personnel at the pre-burn briefing. Everyone will be provided a copy of the project map. Firing operations for the entire unit should be completed in one to two days. After the unit has been fired and mop up has been completed, the burn will be turned over to the Resource Management Specialist at Wilson's Creek. He will set up daily patrols as needed until the fire is out. The resource specialist will be the person to call the fire out. Once the fire is called out, the Ozark NSR Fire Management Office will be notified.

TEST IGNITION:

A test ignition at the burn site will be conducted with a drip torch to observe ignition and combustion rates on the actual day of the burn. The burn boss will decide this location based on current wind direction. All holding resources will be present at the site. If the observed burning conditions or fire behavior is not acceptable, the test burn will be suppressed and the primary burn project delayed. If deemed successful, firing of the primary unit may continue.

FIRING AND IGNITION:

The Burn Boss will determine prevailing wind direction and create a buffer strip on the downwind side of the burn. Once completed, the flanks will be ignited working up-wind. As the fire backs against the wind, the Burn Boss may decide to use short strip head fires to keep the burn moving into the wind or to keep the backing fire even across the unit. This interior ignition will be at the discretion of the Burn Boss. In the event that smoke becomes an issue, the Burn Boss will decide whether to stop the burn or continue depending on the stage of burn completion. At this point the Burn Boss can ring fire the unit decreasing smoke production and time of burning. The Burn Boss will document these decisions on a unit log.

HOLDING ACTIONS:

The holding team will secure the fireline using handtools, water unit ATV's, engines, possible hose lays and backpack pumps. No night operations are planned. Ignition of these units will be completed in less than eight hours. The holding resources will follow up the ignitors immediately mopping up the line creating a cold line. Once the burn has been completed, the lines will be mopped up interior to 100 feet.

MOP-UP OPERATIONS:

The fire will be mopped up at least 100' in from the lines as soon as possible. This will be done before all resources are released from the incident. No night operations are planned or anticipated.

Burn unit boundaries will be hand ignited with drip torches or atv torches. The unit interior will also be hand ignited with drip torches or atv torches at the direction of the Burn Boss with coordination of the Ignition Specialist.

M. WILDLAND FIRE TRANSITION PLAN

1. If spot fires or slopovers occur, the Holding Specialist will initially supervise suppression actions.

2. If spot fires and/or slopovers cannot be controlled within one burning period with on-site resources the Burn Boss will convert the prescribed fire to a wildland fire. A Wildland Fire Situation Analysis (WFSA) will be completed. Any suppression actions will be in accordance with the Ozark National Scenic Riverways Fire Management Plan.

3. If the burn is converted to a wildland fire, the Burn Boss will make the declaration and assume the role of Incident Commander until relieved by an Incident Commander Type III (ICT3). An Incident Commander Type III will be ordered and used in the organization of the burn. The I.C. will immediately notify **Mark Twain National Forest Dispatch (573-341-7455) and WICR Superintendent** of the change in status to a wildfire and will order the appropriate resources. The I.C. will also complete a WFSA. Dispatch will order additional resources specified by the I.C., and suppression actions on the escape fire will be conducted using the most appropriate suppression response. Any suppression actions will be in accordance with the Wilson's Creek National Battlefield Fire Management Plan. On-scene individuals will be utilized and assigned to suppression positions.

4. If the Burn Boss is occupied on the escaped fire, the Holding Specialist will assume command of the prescribed fire, and begin operations to hold and mop-up the prescribed fire.

5. Water sources will be identified on the project map.

N. PROTECTION OF SENSITIVE FEATURES

A. Archeological features should not be impacted by the project, as control lines will be raked or mowed, as often as possible utilizing existing roads and trails, as no soil disturbance is anticipated during project preparation. Any cultural sites discovered during the pending survey requiring mitigation would be identified and prepared prior to ignition.

B. No foam concentrate or solution will be handled, mixed, or sprayed within 50 feet of any water source.

O. PUBLIC AND PERSONNEL SAFETY

A. "Prescribed Burn-Do Not Report" and/or "Smoke Ahead" signs will be posted along ZZ Highway and Route 182.

B. Traffic control will be conducted by assigned burn personnel and/or Park Rangers along the park road if smoke emissions are impacting driving visibility.

C. A safety briefing will be given at the pre-burn briefing and at the start of each operational period. An Incident Action Plan describing burn operations, objectives, personnel/division assignments, and radio frequency information will be distributed to all personnel. A project map and spot weather forecast will be distributed, as well. All personnel will be advised of Lookouts, Communications, Escape Routes, and Safety Zones. Any potential safety hazards (power lines) will be pointed out.

D. All burn personnel will wear standard fire fighting leather boots, Nomex clothing, leather gloves, and a hard hat. They will carry a fire shelter and a fire tool at all times.

E. All standard wildland fire fighter safety rules will be strictly enforced (ref: Fireline Handbook).

F. Ensure safety of FEMO with Burn Boss and maintain effective communication with ignition and holding teams.

G. The public will be kept at a safe distance from the firelines. Authorized personnel must accompany all visitors and press.

H. In case of an accident or injury involving fireline personnel or the public, refer to the Medical Plan (Appendix #16).

I. Only red-carded personnel or cooperators who meet their own agency's qualifications will be utilized during the burn.

1. EMERGENCY MEDICAL PROCEDURES:

- EMT or First Responder assigned the day of the burn.
- First Aid equipment available and location made known to all burn personnel.
- Burn Boss notified immediately of injury.
- Burn Boss will coordinate with EMT/First Responder.
- Burn Boss will notify Park Dispatch of an injury and will follow up with information as soon as the injury has been assessed.
- EMT/First Responder will assess injury and begin treatment.
- Once injury has been assessed, the Burn Boss or designee will activate the appropriate EMS response for evacuation of injured personnel.
- If personnel need to be evacuated, park dispatches will dispatch/contact EMS resources from the following table or the Medical Unit Plan (ICS-206) located in the Appendix.

RESOURCE	CONTACT PHONE NUMBER	LOCATION
Cox Air Care	911	Springfield, MO.
Brookline VFD	911	Springfield, MO.

P. SMOKE MANAGEMENT AND AIR QUALITY

COMPLIANCE:

In the state of Missouri, prescribed fire is considered to be agricultural burning and there are no burn or smoke permit requirements. The Air Pollution Control Dept. of the Missouri Dept. of Natural Resources will be notified prior to the burn.

MODELING:

Weather and Smoke Management forecasts will be obtained from the National Weather Service Forecast Office in Springfield, Missouri. A Smoke Trajectory Map has been completed to show the preferred wind direction in relationship to the critical receptors listed below.

MITIGATION:

A. Moderate smoke volume and/or decreased visibility may occur along the ZZ Highway, immediately west of the project, as well as on the county road 182. Park personnel will

assist with traffic control if visibility poses a safety problem for road traffic. Highway warning signs will be posted along nearby public roads.

B. Critical receptor points are:

• Battlefield, Missouri	3 miles northeast
• Republic, Missouri	3 miles northwest
• Springfield, Missouri	6 miles northeast
• Nixa, Missouri	6 miles southeast

C. If enough smoke does drift towards across the ZZ Highway, or other roads near the park, to impact traffic safety, the Burn Boss will determine if further burning operations should be suspended, if smaller strips should be ignited, or if traffic control should be initiated.

D. Considering the small area to be burned, little smoke impact to park neighbors and nearby communities is expected. Smoke along Highway ZZ is of greater concern than long-range smoke impacts; therefore the preferred wind direction is S to SW. Nighttime smoke will drift downstream along Wilson's Creek and the James River away from the critical receptors.

E. Smoke emissions and behavior will be continually monitored and documented on a smoke observation form. Any significant change in smoke emissions and/or column behavior will be reported to the Burn Boss.

F. All sensitive and critical areas were identified and smoke trajectories plotted. In the appendix a smoke trajectory map illustrates a smoke trajectory with the preferred north, west or east airflow.

G. Smoke concentrations will be minimized by burning with a daytime visibility of at least 15 miles, a minimum mixing height of 1100 feet, a transport wind speed of at least 9 mph, and a following nighttime forecast of no area fog.

Q. INTERAGENCY COORDINATION AND PUBLIC NOTIFICATION

PRE-BURN COORDINATION ACTIONS & MEDIA RELEASES:

A. Wilson's Creek National Battlefield staff will prepare a news release at least one week prior to the burn. A news release will be posted in nearby public places and will also be distributed to local media contacts.

B. Mandatory and optional notifications will be made on or prior to the day of the burn by the dispatcher as specified below.

C. The appropriate Sheriff's Offices will be notified on the day of the burn by the dispatcher.

D. The Missouri State Highway Patrol will be notified prior to the burn.

E. Affected adjacent landowners will be contacted the day before the burn by the dispatcher or Burn Boss.

F. An Information Officer may be ordered for the burn if deemed necessary by the Fire Management Officer and/or Superintendent.

G. Notify the Park Superintendent and/or Information Officer at least one week prior to the proposed ignition date.

NOTIFICATIONS: Located in the Appendix # 12

R. MONITORING AND EVALUATION PROCEDURES

PRE-IGNITION:

There are currently no fire effects plots utilizing NPS monitoring protocol located within the project boundary. The Prairie Cluster I & M Monitoring Crew are providing all long-term monitoring at this site.

DURING THE BURN:

A. During the burn, on site monitoring will be conducted by the lead FEMO and other assigned FEMO's. These people will be responsible for the collection and documentation of the following environmental parameters: temperature, relative humidity, mid-flame wind speed, flame length, flame height, flame zone depth, and rate of spread. These measurements will be made every 30 minutes or at the discretion of the Burn Boss.

B. Fire monitoring on I & M Prairie Cluster plots will be conducted with the above information recorded. Fire monitor will take before and after photographs of plots at pre-determined photo points.

C. I & M Prairie Cluster crew will monitor plots. Documentation of fire behavior will be included in post-burn summary. The fire monitor on the burn will prepare a fire monitor's report and submit to the Burn Boss or designated person.

Transect Plots: Established by Resource Management staff and/or the Prairie Cluster I & M crew.

Photo Points: Will be established by the Ozark fire effects crew.

D. Monitors will maintain communication with the Burn Boss, Ignition, and Holding Specialists to ensure safe operations when working in the interior of the burn.

POST-BURN:

After the burn, a fire critique will be conducted by the Fire Management Officer, Burn Boss, selected members of the prescribed burn team, and the park staff to evaluate the level at which the burn objectives were accomplished.

S. POST FIRE REHABILITATION

A. The fire staff will evaluate all temporary fire lines once the Burn Boss has declared the prescribed burn out. If it is determined that rehabilitation work is necessary, it will be completed with project funds within six months of burn completion.

B. If any firelines are made barren of natural vegetation, leaves, needles, grass, or other native natural organic material will be replaced to encourage growth of vegetation.

C. Branches will be placed across the lines in order to discourage their use as ATV or hiking trails.

D. All flagging will be removed.

T. POST FIRE REPORTS

A. The Burn Boss/I.C. and Lead FEMO will maintain an ICS-214's (Unit Logs) throughout each operational period.

B. The Lead FEMO will prepare and submit an individual report that includes hourly weather, fire behavior and smoke observation data to the Ozark Fire Management Officer.

C. The Burn Boss will prepare an Individual Fire Report, DI-1202, within five days of declaring the fire out.

D. The Burn Boss will prepare a post burn report and submit a copy to the FMO along with a copy of the Fire Monitor report.

E. The FMO will prepare a project accomplishment report in NFPORS and SACS.

F. Ozark Fire Management staff will maintain a project file that includes the burn unit plan, spot weather forecasts, and all required reports.

APPENDIX #5
AGENCY ADMINISTRATOR
GO/NO-GO PRE-IGNITION APPROVAL

Prescribed Fire Name: Date:

A) Instructions

The Agency Administrator's Go/No-Go Pre-Ignition Approval is the first of two GO/NO-GO decisions that must be completed before a prescribed fire can be implemented. The Agency Administrator's Go/No-Go Pre-Ignition Approval is the final management approval prior to execution of the prescribed fire and evaluates whether compliance requirements, prescribed fire plan elements, and internal and external notifications have been completed. The Agency Administrator's Go/No-Go Pre-Ignition Approval is valid for 30 days. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval will be required.

B) Key Elements

1. Is the prescribed fire plan up to date?
   Hints: changes, amendments, seasonality.

2. Have all compliance requirements been completed?
   Hints: cultural, threatened and endangered species, smoke management.

3. Is risk management in place and the residual risk acceptable?
   Hints: Prescribed Fire Mitigation Table and Prescribed Fire Complexity Rating Guide completed with rationale and mitigations identified.

4. Will all elements of the prescribed fire plan be met?
   Hint: preparation work, mitigation, weather, organization, prescription.

5. Have all internal and external notifications and media releases been completed?

6. Are key park staff fully briefed, and understand the implementation of the prescribed fire?

7. Other?

Recommended by: ______________________________ Date ________________
FMO/Burn Boss

Approved by: __________________________________ Date________________
Park Superintendent

Approval expires: ___________ (May not be more than 30 days after approved date.)
Date

APPENDIX #6
Prescribed Fire Operations
GO/NO-GO Checklist

Prescribed Fire Name: Date:

	YES	NO
- Has Agency Administrator GO/NO-GO Pre-Ignition Approval been approved?		
Narrative/Comments:		
- Are current and forecasted weather conditions favorable for execution of the prescribed fire? (hints: spot weather, dialogue with fire weather forecaster, climatological analysis complete)		
Narrative/Comments:		
- Have all key personnel listed on the Incident Action Plan (IAP) been briefed with an opportunity to give feedback? (hints: safety, objectives, assignments)		
Narrative/Comments:		
- Has all pre-burn preparedness work been completed? (hints: fuels and weather observations, signs, closures, smoke management, unit preparation)		
Narrative/Comments:		
- Are all equipment and supplies required in the prescribed fire plan in place and functional? (hints: pumps, radios, ignition devices, hose lays, vehicles, aviation, etc.)		
Narrative/Comments:		
- Are all holding resources described in the IAP committed and can be on-scene within specified time frames?		
Narrative/Comments:		
- Are all personnel certified for their assigned positions? (hints: Check Red Cards)		
Narrative/Comments:		
- There are no extenuating circumstances that preclude successful completion of this project? (hints: regional & national preparedness, unusual circumstances, unusual drought, outstanding issues, other fires, recent fire escapes, etc.)		
Narrative/Comments:		
IF ALL BOXES HAVE BEEN CHECKED "YES" YOU MAY PROCEED WITH THE TEST FIRE.		
TEST FIRE DOCUMENTATION AND RESULTS:		

	YES	NO
- Observed Fire Behavior within Prescription?		
Narrative/Comments:		
- Test fire was successful?		
Narrative/Comments:		
- Are all prescription parameters in the prescribed fire plan favorable for implementing the project? (hints: each plan element, pre-burn, smoke management, cooperator coordination)		
Narrative/Comments:		
IF LAST 3 BOXES ARE ALL "YES", YOU MAY PROCEED WITH PRESCRIBED FIRE.

JOB HAZARD ANALYSIS

United States Department of Interior NATIONAL PARK SERVICE	1. WORK PROJECT/ACTIVITY Prescribed Fire	2. LOCATION Wilson's Creek National Battlefield	3. UNIT All Prescribed Fire
JOB HAZARD ANALYSIS (JHA)	4. NAME OF ANALYST B. Bloodworth	5. JOB TITLE Ozark FMO	6. DATE PREPARED 2-13-04
7. TASKS/PROCEDURES	8. HAZARDS	9. ABATEMENT ACTIONS ENGINEERING CONTROLS – SUBSTITUTION - ADMINISTRATIVE CONTROLS - PPE	
1. Ignition Operations	A. Proximity to intense heat and erratic fire behavior.	A. Use Personal Protective Equipment (PPE), maintain close supervision, and lookouts. Thorough briefing on expected fire behavior. Adjust ignition patterns as needed to reduce exposure and fire behavior.	
	B. Noise of fire obscures verbal warnings.	B. Handheld radios for all ignition personnel.	
	C. Ignition sources.	C. Use only qualified personnel for ignition operations. Igniters stay alert to location of torch flame. Close air vent when not igniting. Make sure that target area is clear before using hand flares or very pistols. Wear proper PPE.	
	D. Incorrect ignition locations. Careless ignition use.	D. Thorough briefing of ignition plan. Follow burn boss's instructions. Know location of other igniters and personnel. Radios for all igniters. Close supervision.	
	E. Poor footing, heavy fuels accumulation.	E. Be constantly aware; identify hazard areas; slow down.	
	F. Poor visibility due to smoke.	F. Post lookouts on roads to gauge visibility. Stage emergency vehicles with headlights and emergency lights on along roads to alert traffic. Use law enforcement to control traffic.	
2. Motor Vehicle Operation	A. General operations and public traffic.	A. Defensive driving techniques. Observe posted speed limits and obey all driving laws and regulations. Use spotter when	
	B. Secure loads.		

	C. Hauling flammable substances. D. Transporting sharp tools.	backing. B. Check loads for security before departing – use tie downs. C. Use appropriate containers for hauling drip torch fuels and gasoline. Secure containers on vehicle. D. Use guards and secure tools in engine compartments or on vehicles.

Firing Crew	3	2	X	4	ch/hr	8
Holding (ATV w/ water)	4	4	X	12	ch/hr	48
Other Personnel			X		ch/hr	
Engine (Crew of 2)	2	2	X	12	ch/hr	24
Dozer (Size)			X		ch/hr	
Other Equipment			X		ch/hr	

5. TOTAL SLOP OVER OR SPOT FIRE LINE BUILDING RATE CAPACITY = 80 ch/hr

6. DETERMINATION OF ADEQUATE HOLDING RESOURCES (Line 5 minus Line 3) 80 ch/hr
If number on line 6 is positive then adequate holding forces will be available. If number is negative, more holding resources are needed to control potential spot fires or slopovers.

Holding Forces Worksheet Justification: The Behave runs for Fuel Model 1 indicate that the fire is to intense for direct attack and that the initial area is larger or nearly equal to the burn area target. Fuel Model 1 is being used to try and represent the fuel bed outside of the burn unit. However it grossly over estimates ROS, FL and FI within the existing fuels surrounding these burn units. The fuel beds that are next to these burn units are severly grazed pasture land with grass that is less than 2 inches tall. The grass within the pastures are cool season with a live moisture content between 250 to 300%. Fires that do occur in these areas exhibit slow rates of spread and low intensity. The Flame Lenghts are less than 1 foot are very easliy control. The existing organization within this burn plan is suffient to control any spots or slop-overs that may occur.

APPENDIX #10
POST-PROJECT EVALUATION

Instructions for Completion of Post-Project Evaluation Form

This form is to be completed and submitted for review within 30 days of declaring the project complete.
Block 1 Self-explanatory
Block 2 Copy of the Project Objectives as listed in the Project Plan.
Block 3 Give quantitative results of how well objectives were met, i.e. % of 1 hour and 10 hour fuels removed, % of burn area with fuels reduced, % of area with acceptable/unacceptable scorch, etc.
Block 4 Give a short narrative of problems encountered and suggestions for improving or refining operations and prescriptions i.e. firing pattern, equipment limitations, drought index, effectiveness of barriers.
Block 5 Self-explanatory - for providing feedback to the Program

Block 1)

APPENDIX # 14
SW-1, SW-2, NW-5 NW-6 & NW -7 Prescribed Fire
Hazard Rating Guide

Hazard Element Environmental Data	Hazard Probability L	Hazard Probability M	Hazard Probability H	Potential Consequences L	Potential Consequences M	Potential Consequences H
a. Seasonal severity	Energy Release Component below 90th percentile levels.	Energy Release Component at or above 90 th percentile levels -- above average drought conditions.	Energy Release Component at or above 97th percentile levels -- severe drought conditions.	Low probability for problematic fire behavior or difficulty in holding activities.	Some potential for problematic fire behavior or difficulty in holding activities.	High probability problematic fire behavior and difficulty in contr
b. Fire Behavior	Flame lengths confined to surface fuels, spread rates low.	Flame lengths extending into shrub and tree regeneration, spread rates moderate.	Flame lengths highly variable, frequently involving individual tree crowns, spread rates moderate to fast.	Low probability of difficulty in holding fire or for adverse fire effects.	Some potential for fire behavior to approach upper prescription limits and cause undesirable effects.	High potential fo fire behavior to create holding problems, excee prescription ranges, and cau undesirable effe
c. Fuels	Surface fuels light with open tree canopies, small shrub component present.	Surface fuels moderate with variable forest stand density and moderate shrub presence.	High surface fuel loading with dense shrub component and dense stands with abundant regeneration.	Fuels present no specific implementation problems.	Fuels will have a marked effect on implementation activities and holding force requirements.	Fuels will dramatically affe management organization an qualifications fo implementation.
d. Weather	Weather stable, winds light and predictable, no frontal activity.	Weather slightly variable, winds present but light, occasional gusts, no frontal activity.	Weather highly variable, winds near prescriptive limits, gusts prevalent, frontal activity possible.	Little impact on implementation.	Weather variation will require mitigation actions involving additional resources.	Weather will ser as a major influence on organization, personnel qualifications, a specific implementation actions.
e. Topography	Low variability in slope and aspect.	Some variability in slope and aspect, will affect fuel moisture and fire behavior.	High variability in slope and aspect, major implications on fire behavior and must be considered in prescription development and implementation.	Little influence on burn implementation.	Consideration of topography during planning process is necessary.	Topography will necessitate mitigation actior to be developed and firing patter and ignition methods to be modified to redu impacts.

Agency Values						
a. Ecological and Environmental Considerations	Fire poses little threat to cause adverse effects or long- term disturbances to natural resource values. No T and E species or critical habitat.	Fire poses moderate threat of adverse effects on natural resources and may cause short- to mid-term alterations or inconveniences such as air quality. Small amounts of T and E species present.	Fire poses high potential for adverse effects to natural resource values or to cause long- term degradations in air quality. Some T and E species present and/ or critical habitat.	Low probability for adverse impacts and little need for mitigation actions.	Mitigation actions may need to be developed to ensure desirable outcomes. Some short- term effects may have to be accepted.	Prescribed Fire Plan must addr mitigation actio to prevent undesirable outcomes.
b. Social and Cultural Values	No known social or cultural values in or adjacent to the project area.	Features of social or cultural value have been identified in and adjacent to the project area. Mitigation measures can be accomplished.	High social or cultural values have been identified in or adjacent to the project area. Mitigation actions are difficult to accomplish.	Severe fire behavior or fire outside the unit would not damage the identified values.	Severe fire behavior or fire outside the unit poses potential for moderate damage to special values. Concerned parties are aware and supportive of the project.	Excessive fire severity or fire outside the unit have adverse effects (substan damage to or potential destruction of th special sites). Acceptance by concerned parti is low.
c. Project Duration and Logistics	Fire planned to be of short duration, logistical needs easily accommodated.	Fire planned to be of short to moderate duration, logistical needs pose some difficulty.	Fire planned to be of moderate to long duration, logistical needs create much difficulty in accomplishing.	No consequences because of duration or logistics.	Duration may impact firefighters and public and logistical needs must be specifically addressed.	Long duration fi necessitates greater informat dissemination, mitigation to remove impacts firefighters and public, and logistical needs must be met or project postpon
d. Smoke and Air Quality Management	Few smoke sensitive areas near project area. No potential scheduling conflicts with cooperators.	Multiple smoke sensitive areas, mitigation actions minimize impacts, low potential for scheduling conflicts.	Multiple smoke sensitive areas near burn area, mitigation actions unable to remove all impacts, duration increases impacts, high potential for scheduling conflicts.	No adverse smoke consequences.	Mitigation actions must address smoke impacts, and coordination is required to confirm scheduling.	Mitigation actio must be develop regulatory agen must concur, scheduling conf may restrict implementation

Hazard Element	Hazard Probability L	Hazard Probability M	Hazard Probability H	Potential Consequences L	Potential Consequences M	Potential Consequences H
Public Values						
a. Land use values	No commercial or agriculture activities near planned burn area.	Some commercial or agricultural activities near burn unit, some managed wildlands (recreation, timber, range values).	Planned burn directly adjacent to urban, commercial, and/ or agriculture areas.	No impacts from land use values.	Escaped fire onto nearby managed land causes some impacts to commercial values. Prescribed Fire Plan must consider actions to prevent fire movement onto commercial and/ or agriculture lands.	Escaped fire on nearby manage land causes significant impa to commercial values. Mitigatic actions must ref additional resou needs to protec urban, commerc and/ or agricultu areas. If mitigati cannot be accomplished, b must be postponed.
b. Dwellings	No permanent or part-time residences present in area.	Some residences ½ mile or less from burn area.	Planned burn is located in wildland-urban interface zone, permanent residences in close proximity.	No impacts from dwellings.	Plan must address actions to ensure adequate protection of residences.	Notification of a concerned homeowners, residents, and visitors, coordination wit local fire protect organizations is needed, and mitigation actior must adequatel address potenti fire escapes.
c. Non-dwellings	No non- dwellings present.	Some outbuildings and non- residences ½ mile or less from burn area.	Commercial structures in close proximity to burn area.	No impacts.	Planning must consider these non- dwellings.	Planning and implementation must adequatel address all measures to prevent any adverse impacts

Human Factors						
a. Firefighter	Little firefighter exposure.	Some firefighter exposure due to fire duration and smoke.	Potential for high firefighter exposure to smoke during burn and to fire during holding actions.	No specific problems, implement standard safety measures.	Mitigation measures to eliminate smoke exposure.	Mitigation measures must address smoke exposure, use o mechanized equipment to eliminate expos to fire.
b. Public	No public exposure.	Some public exposure, mitigation actions can remove/ minimize exposure.	Public may be exposed to high smoke concentrations for moderately long periods, especially during nighttime hours.	No adverse consequences anticipated.	Mitigation actions necessary to provide for maximum public safety.	Mitigation actior must be develop coordinated wit other emergenc organizations ar fully understood prior to ignition.
c. Fire Management	No problems with commitment and acceptance by park staff members.	No problems with commitment but some unwillingness to support and prioritize the prescribed fire over other activities.	Park staff not committed to using prescribed fire as a tool and not willing to support and prioritize prescribed fire over other activities.	No adverse consequences.	Park staff must be briefed on need and importance of prescribed fire.	Park manageme team must be informed of prescribed fire objectives, supp needs, and prior

REVIEWERS' COMMENTS

Fire Management Officer:

Chief Ranger:

N/A

Chief of Natural Resources: Comments incorporated into this plan by B. Bloodworth 1/15/02

Park Superintendent:

Regional FMO

Page 13/14, where are the fire behavior predictions? I would like to see the FL, ROS, listed in the charts for the weather parameters that you have identified. RLB 2/7/02

Page 14, last paragraph. Spelling error, its not "migrated" but mitigated. Done RLB.

Page 15, If you are going to described the ignition sequence then I need to be able to go to the map appendix and visualize the wind, topography and sequence of events. Not require to have firing map (CH.10) RLB.

Page 58, Appendix #9, I don't like the words "positive and negative" why not greater

than or less than? Easier to understand. FRB 2/6/02 Standard Form.

Table of Contents

B. EXECUTIVE SUMMARY

This burn supports the park's broad historic landscape restoration efforts to reestablish native plants and open savanna found during the civil war battle on August 10, 1861, for which the park was established. This project is part of continuing sequence of entry and maintenance burn projects to restore this historic landscape. The park brochure (1992) entitled "A Guide to Historic Landscape Restoration" reads:

> *"Prior to European settlement, savanna covered one third of Missouri. Today, only a few remnants of original savanna remain. Reestablishing an example of this unique biological community is not only an investment in our future but will, with time, recreate the 1861 landscape that was the stage for this important battle."*

This project also supports the following specific objectives found in the park Fire Management Plan:

- To utilize prescribed fire as a professional management tool to restore and perpetuate the natural environment and its processes and the historic scene. Initially, the park may implement prescribed burning for savanna restoration and preservation. Ultimately, as research provides the necessary knowledge and management recommendations, prescribed fire use are envisioned to be utilized for other management purposes.
- To research the proper role and effects of fire upon the park's natural and affected historical resources to provide management recommendations.

C. DESCRIPTION OF PRESCRIBED FIRE AREA

GENERAL AREA:

LOCATION:

Legal:

1. T 28 N, R 23 W, SEC 23,24,25,26 & 36
2. Latitude N 93 24' 30"
   Longitude W 37 06' 30"
3. UTM Zone_____, Easting__. Northing__.

Fire Management Zone: Suppression.

District: N/A .

GEOGRAPHIC ATTRIBUTES:
Size: 676.6 acres

Elevation Range: 1080 to 1250 ft.

Slope Range: 0-10 %.

Aspect Range: Wilson's Creek runs north to south bisecting the unit. Lands east of Wilson's Creek have a generally west aspect and visa versa.

DESCRIPTION OF PROJECT BOUNDARIES:

The unit is bounded on all sides by the 18-foot-wide asphalt park tour road, which begins and ends at the park Visitor Center in the northwest corner of the park. The Old Wire Road, Wilson's Creek, secondary roads and trails form the boundaries between interior units shown on the Project Map (Appendix #1). These interior units will be designated, as blocks of which there will be four.

Block #1: This interior unit will include bloody Hill and the Edwards Cabin. The boundaries are everything east of Wilson's Creek, west of the Tour Road and North of the Wire Road (BH-1, BH-2, BH-3, NW-4).

Block 2: This unit will include the Ray Cornfield, Ray Orchard and the Pulaski Battery. The Tour Road is on located on the East, Wilson's Creek to the West and the Wire Road to the South (NE-2, NE-3, NE-4, NE-6)

Block 3: This includes all land south of the Wire road but still inside the Tour Road. Wilson's Creek splits this block in half (CN-1, CN-2, CN-3, SW-3, SW-4).

Block 4a &b: The critical habitat for *Lesquerella filiformis* is located in this block 4 a & b. This block will be excluded in the spring/fall burn windows and burned in the summer as a separate block within this plan. Block 4 is located on North Bloody hill and block 4 b is located by the weather station site (Walnut and North Glade).

Note: Block 4 a & b may be included in the entire burn project if these areas show no *Lesquerella filiformis* plants in the plots located within these blocks. In some years, *Lesquerella filiformis does not* appear.

VEGETATION DESCRIPTION:

The unit is 88% fuel model 2 and 12% fuel model 9. The fuel model surrounding the burn unit is often fuel model 9. This is indicated in the Holding forces worksheet. Fuel model 9 is used to calculate holding resources, as FM1 and FM3 overpredict fire behavior The area surrounding the park is pastureland with some residential areas. For the purpose of calculating fire behavior, percentages of 80% in fuel model 2 and 20% in fuel model 9 will be used.

Vegetation Type	Fuel Model NFFL	Estimated Acres	Estimated Tons Per Acre
Short/Tall Grass	1/3	577	2 - 6
Hardwood litter	9	80	2 - 10

PROJECT MAP (Appendix #1) The burn boss will assign points on the map for ease of communication while units are burned.

VICINITY MAP (Appendix #1)

D. GOALS AND OBJECTIVES

GOALS

1. Reduce wildfire risk to urban interface improvements immediately outside of the park boundary, as well as historic park improvements,
2. Restore fire and associated natural processes in order to retain tall grass prairie species composition and hardwood savannas, characteristic of the park's historic natural communities an average of 10 to 12 oak trees per acre.
3. Protect riparian areas.
4. Provide training opportunity for firefighters

SPECIFIC OBJECTIVES:	PROPOSED REDUCTION WITHIN ONE YEAR	ACTUAL RESULTS
Burn unit with a moderate severity burn.	75-95%	
Reduce 1-hour fuel loading (litter layer).	50-80%	
Reduce 10-hour fuels.	40-70%	
Top-kill of saplings greater than 1.4 meters tall and less then 2.5 meters tall in the forested areas and where hardwoods are encroaching in historic open fields.	>40%	

Range of Acceptable Results Expected across the Project Area

Throughout the entire unit a mosaic of different levels of fire severity are desired and acceptable.

E. RISK MANAGEMENT

This burn project has a low risk value as calculated by the hazard risk analysis process. Assessing reasonable risks and the mitigation to lower these risks generates this low rating. This is documented on the Hazard Rating Guide, Prescribed Fire Risk Analysis Worksheet, and Job Hazard Analysis.

F. PROJECT COMPLEXITY

This burn rates as a low complexity project that should pose no unusual risks to personnel safety or property. Burn duration will be 24 hours or less per interior blocks/unit, with isolated residual burning expected in fuel jackpots.

HAZARD, RISK AND COMPLEXITY WORKSHEETS (attached)

G. ORGANIZATION

The Burn Boss may order additional resources to assist with the project before ignition if in their professional judgement they are needed. This may be done after consultation with the project coordinator or Ozark Fire Management Officer. All non-park resources will be ordered and committed to the prescribed fire project through the Missouri Interagency Dispatch Center (MOCC). The holding resource worksheet and Fireline Handbook will be used to determine adequate number and type of holding resources for each scenario. Specific resources will be identified in an incident action plan prepared prior to each operational period during the implementation of the burn. It is anticipated that one or both Mid-west Fire Use Modules will be used. The regional office will provide a burn boss if Ozark NSR or Buffalo NR can not.

A total of Fifteen (15) persons will be the minimum required conducting the prescribed fire.

Overhead Personnel:
1 Burn Boss/ Incident Commander (RXB2)
1 Ignition Specialist (RXI2)
1 Holding Squad Leader (FFT1)
1 Fire Effects Monitor

Additional Crews/Personnel/Resources For Daytime Holding and Ignition Operations:
3 FFT2 – Ignition Crew
2 Type 6 engine with operator and asst. operator
4 ATVs with Water Tanks and operators.

H. ESTIMATED PROJECT COSTS (non-base, other agency, contract):

Costs will be primarily for personnel and equipment preparing and conducting burn operations. The unit requires some preparation. Firing operations and post firing patrols should be of short duration with the goal of keeping overall costs low.

FUNCTION	PROJECTED WORK HOURS/	PROJECTED COSTS*
Planning	10 hours (base salary paid) Rx Fire Plan development	$0.00
Unit Preparation	20 hours blow line, hazard tree mitigation, brush hog line	$300.00

Operations (including burning, holding, mop-up)	50	$750.00
Travel	12 people (includes per diem and lodging) X 4 days	$3990.0
Monitoring & Evaluation	2 (collateral assignment) site visit coordination between WICR staff and FMO.	$250.00

TOTAL PROJECTED COST <u>$ 5290.00</u> divided by <u>657</u> acres = <u>$ 8.05</u> PER ACRE
*Required information in final report: ACTUAL COSTS, COST PER ACRE, WORK HOURS PER ACRE.

I. SCHEDULING

Proposed Ignition Date:	Oct. 1 2002 to Sept. 30th 2002
Projected Burn Duration:	5-6 days total
Actual Ignition Date:	
Date Declared Out:	
Date DI-1202 Submitted:	

J. PRE-BURN CONSIDERATIONS

ON SITE PREPARATION NEEDS:

A. Construct a leaf blown and wet line (on the day of the burn) around block # 4 this serves to exclude critical habitat for *Lesquerella filiformis* found in the area of the Lyon's marker on top of North Bloody hill glade and Walnut glade. Cedar trees, brush and other ladder fuels will be removed 60 ft. inside the burn along the control line. Limb any low-hanging branches and remove any large woody debris, including snags, within 60 feet of the fireline.

B. Remove hardwood litter from all roadways and trails to be utilized as control line including the Wire Road and hiking trail. Remove any low-hanging branches or woody debris that may interfere with a wildland fire engine or ATV travelling along these routes.

C. Construct a 6-8 foot wide mow line in grass around the edge of all split rail fences and cannons, which are being protected. In all fields, the split rail fences and cannons are not to be burned.

D. Foam the Edwards Cabin the day of the burn and have a 8 to 10 foot mowed line in place.

E. Prepare 20 gallons of burn mix.

F. Access the nearest remote automated weather station at least two days prior to the ignition date to assess fuel moisture and weather conditions.

G. Take fuel moisture samples from the site and calculate % fuel moisture for 1-hr. fuels one day prior to the burn.

H. Set-up four all-terrain vehicles outfitted with water tank and pump and one all-terrain vehicle outfitted for patrol. Transport ATVs to burn site.

I. DAY OF BURN: Set up "Prescribed Burn" and "Smoke" signs along the Tour Road, Wire Road, ZZ Highway and Route 182.

J. Close all trails adjacent to and in the project area.

K. Fill at least 4 bladder bags and place on the engines.

L. Program handheld radios for frequencies identified in the Communications Plan (Appendix #16).

OFF SITE:

A. WICR staff will purchase needed equipment and supplies.

B. WICR staff will notify local fire departments of the scheduled burn and their role.

C. WICR staff will complete a press release at least one week prior to the proposed burn in the local newspaper.

D. At least a week prior to the burn, WICR staff will contact the adjacent landowners with a press release of the proposed burn.

SPECIAL PRECAUTIONS/REGULATIONS:

A. All improvements (fences, cannons, wayside exhibits and cabin) will be cleared around of fuel prior to the burn.

B. Ignition will stop short of riparian areas and allow the fire to back and go out or holding forces will stop the fire.

C. Endangered species habitat areas adjacent to the Lyon's marker, North Bloody Hill Glade and Walnut Glade will be protected with a wet and leaf blown line.

D. A herpetological study is ongoing within all burn blocks. After each burn unit is complete, personnel will put out smoldering cover boards (map located in appendix).

Safety Hazards: Visitor safety; smoke on the Loop Rd. and Hwy. ZZ and along control lines. Crew safety; safety zones, visibility, and exposure to smoke. **Mitigation:** The area,

including all trails, will be closed while burning. Visibility on roads will be monitored and controlled. "Smoke Ahead" and/or "Prescribed Burn" signs will be posted. The tour road will be kept open but closed when visibility is reduced to 100 yards. Strip burning may be used to increase heat to reduce smoke output. All personnel will have PPE. Escape routes and safety zones will be identified. Engines and Atvs will have headlights on.

K. PRESCRIBED FIRE PRESCRIPTION

NFFL Fuel Models used: 3 & 9 80% and 20 %

BURNING PRESCRIPTION AND OBSERVED CONDITIONS:

A prescribed fire prescription containing those key parameters needed to achieve desired results (see page 7). Prior to ignition, compare prescription elements, both individually and collectively, against local weather forecasts and any other predicted conditions. During implementation of the burn, if objectives are not being met, further ignition shall be evaluated; therefore, prescription parameters must be wide to accommodate established objectives while staying within fire personnel capabilities. All changes to the prescription parameters must be approved with same level of authority required for the plan approval.

The prescription is based on fuel moisture, wind speed and relative humidity. Temperature ranges will not be used as a constraint.

Blocks 1, 2 and 3

ENVIRONMENTAL VARIABLES	HOT	OPTIMUM	COOL	OBSERVED*
Temperature (dry bulb %):				
Relative Humidity (%):	20	30	50	
Wind Direction:	S/SW to N/NW	S/SW		
Wind Speed (midflame):	8 mph	4 mph	2 mph	
Dead Fuel Moisture (%) 1 Hour:	5	8	10	
10 Hour:	8	11	14	
1000 Hour:	14	18	20	

*At time of ignition

PREDICTED FIRE BEHAVIOR	HOT	OPTIMUM	COOL	OBSERVED*
Rate of Spread (ch/h):	192.5		26	
Heat per Unit Area (Btu/ft2):				
Fireline Intensity (Btu/ft/s):				
Flame Length (ft):	18.5		6.0	

*Standard observation time
See Appendixes for BEHAVE Projections

Block 4 a & b

ENVIRONMENTAL VARIABLES	HOT	OPTIMUM	COOL	OBSERVED*
Temperature (dry bulb %):				
Relative Humidity (%):	20	30	80	
Wind Direction:	S/SW to N/NW	S/SW		
Wind Speed (midflame):	8 mph	4 mph	2 mph	
Dead Fuel Moisture (%) 1 Hour:	5	8	10	
10 Hour:	8	11	14	
1000 Hour:	14	18	20	

*At time of ignition

PREDICTED FIRE BEHAVIOR	HOT	OPTIMUM	COOL	OBSERVED*
Rate of Spread (ch/h):				
Heat per Unit Area (Btu/ft2):				
Fireline Intensity (Btu/ft/s):				
Flame Length (ft):				

*Standard observation time
See Appendixes for BEHAVE Projections

Behave Projections

The Behave projections are located in the appendixes. Fuel models 2, 3, and 9 represent blocks 1, 2 and 3. Fuel models 2 & 9 represent block 4. Fuel model 9 is used to calculate the holding forces worksheet due to the fact that fuel model 3 will overpredict fire behavior. The fuels outside of the burn unit are mowed hay fields and hardwood forest. Block 4 will be surrounded by fuel 3 that was burned in the spring will have a live moisture content at the time block 4 is burned of over 300%. **Note:** The high fire intensities and rate of spreads predicted will be interior in each blocks. This will be migrated by the burn boss with firing patterns and sequences. During black lining operations, fire intensities will be low due to burning on the low end of the prescription and the fact that intensities are over predicted in these blocks.

L. IGNITION AND HOLDING ACTIONS

TEST IGNITION:

A test burn will be ignited near the main point of origin of the burn. Fuels and topography will be representative of most of the project. The Burn Boss will decide at that point to initiate the main

burn or not. It is most likely that the test burn will be conducted near the junction of the Wire Road and Tour Road (near wayside exhibit #5).

FIRING AND IGNITION:

The firing order will depend largely on wind direction the day of the burn. The burn will be broken down into blocks. The area containing the T&E species habitat is part of block #1, but will be treated in the Summer/Fall. Each block will be treated separately from the others. Since the basic shape of each unit is a rectangle, the downwind firelines will be "blacked-out" in order to make them more secure. A combination of strip head and strip backing ignition methods will be used to build good secure buffer zones along the firelines. Once the exterior firelines, cannons, block #4 and the Edwards cabin are secure, the Burn Boss will determine the best strategy for completing each block.

HOLDING ACTIONS:

All engines and ATV's will be mobile and used accordingly to provide adequate patrol behind the ignition teams. A hoselay, atv with water or engine patrol will be in place along the T & E species habitat exclusion line. Two wildland engines will be used to patrol behind ignition, one engine will patrol on roadways just outside the park boundary, while the fourth engine is on stand-by for water shuttles. Water sources include fill sites at the resource management office, as well as the hydrant at the park Visitor Center. The bulk of handcrew resources will be committed to holding and patrol immediately behind ignition operations.

MOP-UP OPERATIONS:

The fire will be mopped up at least 200' in from the lines as soon as possible. This will be done before all resources are released from the incident. This may require that the fire be staffed all night for one or two nights until this is accomplished. The fire will be checked every day until no smokes are seen for two days in a row.

Burn unit boundaries will be hand ignited with drip torches or atv torches. The unit interior will also be hand ignited with drip torches or atv torches at the direction of the Burn Boss with coordination of the Ignition Specialist.

The Burn Boss or Ignition Specialist will thoroughly describe the firing plan and safety considerations to all burn personnel at the pre-burn briefing. Everyone will be provided a copy of the project map. Firing operations for the entire unit should be completed in one to two days. After the unit has been fired and and mop up has been completed, the burn will be turned over to the resource management specialist at Wilson' Creek. He will set up daily patrols as needed until the fire is out. The resource specialist will be the person to call the fire out. Once the fire is called out, the Ozark NSR Fire Management Office will be notified.

M. WILDLAND FIRE TRANSITION PLAN

ESCAPED FIRES:
An escaped fire is an unwanted fire outside the project boundaries that has exceeded holding resource capabilities. If the prescribed fire exceeds project boundaries and/or slopovers and spot fires are not contained within one burning period, the fire will be declared an escaped fire and a Wildland Fire Situation Analysis (WFSA) will be completed. At the time of conversion to an escaped fire, ignition operations within the unit will continue only if deemed to be in the interest of safety and should follow the defined alternatives as outlined in the WFSA.

In case of a fire detected outside the project boundary, designated holding forces will proceed promptly to the spot fire or "slop-over" and initiate the appropriate strategy (direct or indirect) as determined by the Burn Boss and holding specialist. Firing operations may cease at the discretion of the Burn Boss. Any fire that escapes the project boundary will receive aggressive initial attack with the on-site resources. Infrequent and easily managed spots outside of the burn unit will not necessarily cause a conversion to an escaped fire.

Contingency lines have been drawn using human-made and natural features, which form logical barriers to the spread of fire. All holding personnel will be familiarized, during the briefing, with the contingency area boundaries and associated holding lines. Contingency holding lines include Highway ZZ west and a creek and unpaved road to the south. To the north escape across the Tour Road is unlikely, but Highway 182 could then be utilized as a contingency line. Escape west across the Tour Road is even less likely, but contingency lines would include the park boundary and Highway ZZ.

All escaped fires will trigger the conversion of the prescribed fire (unit and escape) to a wildfire. The primary priority will be public and personnel safety followed by protection of structures and cultural resources. At the time of conversion, the Burn Boss will become the Incident Commander and remain as such until the fire exceeds this individual's qualifications and capabilities and/or a transition can take place.

The I.C. will immediately notify **Mark Twain National Forest Dispatch (573-364-4621 x484) and WICR Superintendent** of the change in status to a wildfire and will order the appropriate resources. The I.C. will also complete a WFSA (see following page). Dispatch will order additional resources specified by the I.C., and suppression actions on the escape fire will be conducted using the most appropriate suppression response. Any suppression actions will be in accordance with the Wilson's Creek National Battlefield Fire Management Plan. On-scene individuals will be utilized and assigned to suppression positions. If management of the escaped fire is turned over to an incident management team (IMT), prescribed fire personnel may be assembled as a division in charge of the burn unit portion of the converted fire.

Resource:	Location and Phone Number:	Response Time:
1. 1 Type VI+ Wildland Engines	1.Fire Chief's Office (417-882-2014)	1. <1 hr.
2.	2.	2.
3.	3.	3.
4.	4.	4.

N. PROTECTION OF SENSITIVE FEATURES

A. Archeological features should not be impacted by the project, as control lines will be raked or mowed, as often as possible utilizing existing roads and trails, as no soil disturbance is anticipated during project preparation. Any cultural sites discovered during the pending survey requiring mitigation would be identified and prepared prior to ignition.

B. The federally listed *Lesquerella filiformis* is known to be utilizing the proposed burn unit area, however an exclusion line will be constructed to exclude habitat for *Lesquerella filiformis* from treatment, during the spring burn treatment. This step exempts the park from undertaking formal consultation with the U.S. Fish and Wildlife Service regarding potential impacts under NEPA. After the *Lesquerella filiformis* dies and cures in the late summer, block # 4 will be treated with prescribed fire.

C. No foam concentrate or solution will be handled, mixed, or sprayed within 50 feet of any water source.

O. PUBLIC AND PERSONNEL SAFETY

A. "Prescribed Burn-Do Not Report" and/or "Smoke Ahead" signs will be posted along major streets and highways near the burn site.

B. Traffic control will be conducted by assigned burn personnel and/or Park Rangers along the park road if smoke emissions are impacting driving visibility.

C. A safety briefing will be given at the pre-burn briefing and at the start of each operational period. An Incident Action Plan describing burn operations, objectives, personnel/division assignments, and radio frequency information will be distributed to all personnel. A project map and spot weather forecast will be distributed, as well. All personnel will be advised of

Lookouts, Communications, Escape Routes, and Safety Zones. Any potential safety hazards (power lines) will be pointed out.

D. All burn personnel will wear standard fire fighting leather boots, Nomex clothing, leather gloves, and a hard hat. They will carry a fire shelter and a fire tool at all times.

E. All standard wildland fire fighter safety rules will be strictly enforced (ref: Fireline Handbook).
F. Ensure safety of FEMO with IC and maintain effective communication with ignition and holding teams.

G. The public will be kept at a safe distance from the firelines. Authorized personnel must accompany all visitors and press.

H. In case of an accident or injury involving fireline personnel or the public, refer to the Medical Plan (Appendix #16).

I. Only red-carded personnel or cooperators who meet their own agency's qualifications will be utilized during the burn.

1. EMERGENCY MEDICAL PROCEDURES:

- EMT or First Responder assigned the day of the burn.
- First Aid equipment available and location made known to all burn personnel.
- Burn Boss notified immediately of injury.
- Burn Boss will coordinate with EMT/First Responder.
- Burn Boss will notify Park Dispatch of an injury and will follow up with information as soon as the injury has been assessed.
- EMT/First Responder will assess injury and begin treatment.
- Once injury has been assessed, the Burn Boss or designee will activate the appropriate EMS response for evacuation of injured personnel.
- If personnel need to be evacuated, park dispatches will dispatch/contact EMS resources from the following table or the Medical Unit Plan (ICS-206) located in the Appendix.

RESOURCE	CONTACT PHONE NUMBER	LOCATION
Cox Air Care	911	Springfield, MO.
Brookline VFD	911	Springfield, MO.

P. SMOKE MANAGEMENT AND AIR QUALITY

COMPLIANCE:

In the state of Missouri, prescribed fire is considered to be agricultural burning and there are no burn or smoke permit requirements. The Air Pollution Control Dept. of the Missouri Dept. of Natural Resources will be notified prior to the burn.

MODELING:

Weather and Smoke Management forecasts will be obtained from the National Weather Service Forecast Office in Springfield, Missouri. A Smoke Trajectory Map has been completed to show the preferred wind direction in relationship to the critical receptors listed below.

MITIGATION:

A. Moderate smoke volume and/or decreased visibility may occur along the ZZ Highway, immediately west of the project, as well as on the county road south of the park. Park personnel will assist with traffic control if visibility poses a safety problem for road traffic. Highway warning signs will be posted along nearby public roads.

B. Critical receptor points are:

• Battlefield, Missouri	3 miles northeast
• Republic, Missouri	3 miles northwest
• Springfield, Missouri	6 miles northeast
• Nixa, Missouri	6 miles southeast

C. If enough smoke does drift towards across the ZZ Highway, or other roads near the park, to impact traffic safety, the Burn Boss will determine if further burning operations should be suspended, if smaller strips should be ignited, or if traffic control should be initiated.

D. Considering the small area to be burned, little smoke impact to park neighbors and nearby communities is expected. Smoke along Highway ZZ is of greater concern than long-range smoke impacts; therefore the preferred wind direction is S to SW. Nighttime smoke will drift downstream along Wilson's Creek and the James River away from the critical receptors.

E. Smoke emissions and behavior will be continually monitored and documented on a smoke observation form. Any significant change in smoke emissions and/or column behavior will be reported to the Burn Boss.

F. All sensitive and critical areas were identified and smoke trajectories plotted. In the appendix a smoke trajectory map illustrates a smoke trajectory with the preferred north, west or east airflow.

G. Smoke concentrations will be minimized by burning with a daytime visibility of at least 15 miles, a minimum mixing height of 1100 feet, a transport wind speed of at least 9 mph, and a following nighttime forecast of no area fog.

Q. INTERAGENCY COORDINATION AND PUBLIC NOTIFICATION

PRE-BURN COORDINATION ACTIONS & MEDIA RELEASES:

A. Wilson's Creek National Battlefield staff will prepare a news release at least one week prior to the burn. A news release will be posted in nearby public places and will also be distributed to local media contacts.

B. Mandatory and optional notifications will be made on or prior to the day of the burn by the dispatcher as specified below.

C. The appropriate Sheriff's Offices will be notified on the day of the burn by the dispatcher.

D. The Missouri State Highway Patrol will be notified prior to the burn.

E. Affected adjacent landowners will be contacted the day before the burn by the dispatcher or Burn Boss.

F. An Information Officer may be ordered for the burn if deemed necessary by the Fire Management Officer and/or Superintendent.

G. Notify the Park Superintendent and/or Information Officer at least one week prior to the proposed ignition date.

NOTIFICATIONS: Located in the Appendix # 12

R. MONITORING AND EVALUATION PROCEDURES

PRE-IGNITION:

There are currently no fire effects plots utilizing NPS monitoring protocol located within the project boundary. The Prairie Cluster I & M Monitoring Crew are providing all long-term monitoring at this site. Two I & M plots are located in BH-3 unit.

DURING THE BURN:

A. During the burn, on site monitoring will be conducted by the lead FEMO and other assigned FEMO's. These people will be responsible for the collection and documentation of the following environmental parameters: temperature, relative humidity, mid-flame wind speed, flame length, flame height, flame zone depth, and rate of spread. These measurements will be made every 30 minutes or at the discretion of the Burn Boss.

B. Fire monitoring on I & M Prairie Cluster plots will be conducted with the above information recorded. Fire monitor will take before and after photographs of plots at pre-determined photo points.

C. I & M Prairie Cluster crew will monitor plots. Documentation of fire behavior will be included in post-burn summary. Fire monitor on the burn will prepare a fire monitor's report and submit to the Burn Boss or designated person.

Transect Plots: Established by Resource Management staff and/or the Prairie Cluster I & M crew.

Photo Points: Will be established by the Ozark fire effects crew.

D. Monitors will maintain communication with the Burn Boss, Ignition, and Holding Specialists to ensure safe operations when working in the interior of the burn.

POST-BURN:

After the burn, a fire critique will be conducted by the Fire Management Officer, Burn Boss, selected members of the prescribed burn team, and the park staff to evaluate the level at which the burn objectives were accomplished.

S. POST FIRE REHABILITATION

A. The fire staff will evaluate all temporary fire lines once the Burn Boss has declared the prescribed burn out. If it is determined that rehabilitation work is necessary, it will be completed with project funds within six months of burn completion.

B. If any firelines are made barren of natural vegetation, leaves, needles, grass, or other native natural organic material will be replaced to encourage growth of vegetation.

C. Branches will be placed across the lines in order to discourage their use as ATV or hiking trails.

D. All flagging will be removed.

T. POST FIRE REPORTS

A. The Burn Boss/I.C. and Lead FEMO will maintain an ICS-214's (Unit Logs) throughout each operational period.

B. The Lead FEMO will prepare and submit an individual report that includes hourly weather, fire behavior and smoke observation data.

C. The Burn Boss will prepare an Individual Fire Report, DI-1202, within five days of declaring the fire out.

D. The Burn Boss will prepare a post burn report and submit a copy to the FMO along with a copy of the Fire Monitor report.

E. The FMO will prepare a project accomplishment report in the National Park Service Wildland Fire Management Computer System.

F. Ozark Fire Management staff will maintain a project file that includes the burn unit plan, spot weather forecasts, and all required reports.

APPENDIX #5
AGENCY ADMINISTRATOR
<u>GO/NO-GO PRE-IGNITION APPROVAL</u>

Prescribed Fire Name: Date:

<u>A) Instructions</u>
The Agency Administrator's Go/No-Go Pre-Ignition Approval is the first of two GO/NO-GO decisions that must be completed before a prescribed fire can be implemented. The Agency Administrator's Go/No-Go Pre-Ignition Approval is the final <u>management</u> approval prior to execution of the prescribed fire and evaluates whether compliance requirements, prescribed fire plan elements, and internal and external notifications have been completed. The Agency Administrator's Go/No-Go Pre-Ignition Approval is valid for 30 days. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval will be required.

<u>B) Key Elements</u>

1. Is the prescribed fire plan up to date?
   Hints: changes, amendments, seasonality.

2. Have all compliance requirements been completed?
   Hints: cultural, threatened and endangered species, smoke management.

3. Is risk management in place and the residual risk acceptable?
   Hints: Prescribed Fire Mitigation Table and Prescribed Fire Complexity Rating Guide completed with rationale and mitigations identified.

4. Will all elements of the prescribed fire plan be met?
   Hint: preparation work, mitigation, weather, organization, prescription.

5. Have all internal and external notifications and media releases been completed?

6. Are key park staff fully briefed, and understand the implementation of the prescribed fire?

7. Other?

Recommended by: ______________________________ Date ________________
FMO/Burn Boss

Approved by: __________________________________ Date________________
Park Superintendent

Approval expires: ___________ (May not be more than 30 days after approved date.)
Date

APPENDIX #6
Prescribed Fire Operations
GO/NO-GO Checklist

Prescribed Fire Name: Date:

	YES	NO
- Has Agency Administrator GO/NO-GO Pre-Ignition Approval been approved?		
Narrative/Comments:		
- Are current and forecasted weather conditions favorable for execution of the prescribed fire? (hints: spot weather, dialogue with fire weather forecaster, climatological analysis complete)		
Narrative/Comments:		
- Have all key personnel listed on the Incident Action Plan (IAP) been briefed with an opportunity to give feedback? (hints: safety, objectives, assignments)		
Narrative/Comments:		
- Has all pre-burn preparedness work been completed? (hints: fuels and weather observations, signs, closures, smoke management, unit preparation)		
Narrative/Comments:		
- Are all equipment and supplies required in the prescribed fire plan in place and functional? (hints: pumps, radios, ignition devices, hose lays, vehicles, aviation, etc.)		
Narrative/Comments:		
- Are all holding resources described in the IAP committed and can be on-scene within specified time frames?		
Narrative/Comments:		
- Are all personnel certified for their assigned positions? (hints: Check Red Cards)		
Narrative/Comments:		
- There are no extenuating circumstances that preclude successful completion of this project? (hints: regional & national preparedness, unusual circumstances, unusual drought, outstanding issues, other fires, recent fire escapes, etc.)		
Narrative/Comments:		
IF ALL BOXES HAVE BEEN CHECKED "YES" YOU MAY PROCEED WITH THE TEST FIRE.		
TEST FIRE DOCUMENTATION AND RESULTS:		

	YES	NO
- Observed Fire Behavior within Prescription?		
Narrative/Comments:		
- Test fire was successful?		
Narrative/Comments:		
- Are all prescription parameters in the prescribed fire plan favorable for implementing the project? (hints: each plan element, pre-burn, smoke management, cooperator coordination)		
Narrative/Comments:		
IF LAST 3 BOXES ARE ALL "YES", YOU MAY PROCEED WITH PRESCRIBED FIRE.

JOB HAZARD ANALYSIS

United States Department of Interior NATIONAL PARK SERVICE	1. WORK PROJECT/ACTIVITY Prescribed Fire	2. LOCATION Wilson's Creek National Battlefield	3. UNIT Core Area
JOB HAZARD ANALYSIS (JHA)	4. NAME OF ANALYST B. Bloodworth	5. JOB TITLE Fuels Specialist	6. DATE PREPARED 12-28-01
7. TASKS/PROCEDURES	8. HAZARDS	9. ABATEMENT ACTIONS ENGINEERING CONTROLS – SUBSTITUTION - ADMINISTRATIVE CONTROLS - PPE	
1. Ignition Operations	A. Proximity to intense heat and erratic fire behavior.	A. Use Personal Protective Equipment (PPE), maintain close supervision, and lookouts. Thorough briefing on expected fire behavior. Adjust ignition patterns as needed to reduce exposure and fire behavior.	
	B. Noise of fire obscures verbal warnings.	B. Handheld radios for all ignition personnel.	
	C. Ignition sources.	C. Use only qualified personnel for ignition operations. Igniters stay alert to location of torch flame. Close air vent when not igniting. Make sure that target area is clear before using hand flares or very pistols. Wear proper PPE.	
	D. Incorrect ignition locations. Careless ignition use.	D. Thorough briefing of ignition plan. Follow burn boss's instructions. Know location of other igniters and personnel. Radios for all igniters. Close supervision.	
	E. Poor footing, heavy fuels accumulation.	E. Be constantly aware; identify hazard areas; slow down.	
	F. Poor visibility due to smoke.	F. Post lookouts on roads to gauge visibility. Stage emergency vehicles with headlights and emergency lights on along roads to alert traffic. Use law enforcement to control traffic.	
2. Motor Vehicle Operation	A. General operations and public traffic.	A. Defensive driving techniques. Observe posted speed limits and obey all driving laws and regulations. Use spotter when	
	B. Secure loads.		

	C. Hauling flammable substances. D. Transporting sharp tools.	backing. B. Check loads for security before departing – use tie downs. C. Use appropriate containers for hauling drip torch fuels and gasoline. Secure containers on vehicle. D. Use guards and secure tools in engine compartments or on vehicles.

IAP/BRIEFING GUIDE

I. Present Handouts

- **A. Map of Burn**
- **B. Organization Chart**

II. Describe Area Of Burn

- **A. Vegetation Type**
- **B. Acreage**
- **C. Slope**
- **D. Roads/Access**
- **E. High Values at risk**
- **F. Water Sources-natural, tanker and hydrants**
- **G. Natural/Manmade barriers**

III. Weather Forecast- Use National Weather Service "Forestry" and "Smoke Management" Forecasts for applicable Zones. Use "Fire Weather Special Request" Form if updates are deemed necessary.

- **A. Wind direction and Speed**
- **B. Relative Humidity**
- **C. Temperatures**
- **D. Predicted Changes**

IV. Organization

- **A. Organization Chart – Location on Map**
- **B. Equipment - tankers, refueling, etc.**
- **C. Fire Monitoring**
- **D. Any other resources**
- **E. Transition Fire Plan**

V. Firing Sequence

- **A. Test fire**
- **B. Type and Sequence of Firing**

VI. Radio Assignments

- **A. Given Day of Burn**
- **B. Communication Plan**

VII. Safety

- **A. Winds**
- **B. Escape Routes and Safe Zones**
- **C. Hazards – crew and equipment (wildlife, research plots, trash, etc.)**
- **D. Personal Protective equipment (PPE)**
- **E. Refueling – fuel handling, gloves, spilling, etc.**
- **F. Activation of emergency and headlights on major roads**
- **G. Other public safety considerations**

VIII. Comments and Questions Period

APPENDIX # 9

ADEQUATE HOLDING RESOURCES WORKSHEET

Project Name: Core Area (All Blocks) Fuel Models Inside Project Area: 3 & 9
Prepared By/Date: Bloodworth 12-28-01 Fuel Models Outside Project Area: 9 (E)

Characteristics	Output type	Modeling Predictions Inside Project Area	Modeling Predictions Outside Project Area	Unit of Measure
CRITICAL FIRE INPUTS	1 Hr Fuel Moisture	5	5	%
	Wind Speed	9	9	MPH
	Slope	30	30	%
KEY FIRE BEHAVIOR OUTPUTS	Rate of Spread	26	26.0	ch/hr
	Fire line Intensity	186	186	BTU/ft/sec
	Flame Length	5	5.0	Feet
	POI	70	70	%
	Spotting Distance		0.3	Miles
	Scorch Height			Feet
FIRE SIZE	Projection Time			Hours
	Forward Spread			Chains
	Backward Spread			Chains
FIRE CONTAINMENT	Method Of Attack	Rear	Rear	Head/Rear
	Max Escape Target	10	10	Acres
	Max Containment Time	1	1	Hours
	Total Line Building Rate	63	63	Ch/hr

1. Choose worst case total line building rate above that is needed for containment of slop over or spot fire : 63h/hr
2. Estimate potential number spot fires or slop overs at on time: 1
3. TOTAL LINE BUILDING RATE NEEDED (multiply line 1 times line 2) 63ch/hr
4. Production Rates: Ease of Access: POOR-FAIR-GOOD-EXCELLEN(circle)
   Fuel Resistance to Control LOW- MODERATE-HIGH-EXTREME(circle)

(refer to fire line handbook) Hand Crew Production 8 ch/hr
Engine Production (Crew of 2) 8 ch/hr
Dozer Production (Type ___) ch/hr

On Site Organization	Total # Planned On Burn	Total # Available for Spot Fire or Slop Over Control		Line Building Production Rates		Spot Fire or Slop Over Line Building Capacity
Overhead	4	0	X	8	ch/hr	0
Firing Crew	3	2	X	8	ch/hr	16
Holding (ATV w/ water)	4	4	X	8	ch/hr	32
Other Personnel			X	8	ch/hr	0
Engine (Crew of 2)	2	1	X	25	ch/hr	25
Dozer (Size)			X		ch/hr	
Other Equipment			X		ch/hr	

5. TOTAL SLOP OVER OR SPOT FIRE LINE BUILDING RATE CAPACITY = 75 ch/hr

6. DETERMINATION OF ADEQUATE HOLDING RESOURCES (Line 5 minus Line 3)__+12____ch/hr
If number on line 6 is positive then adequate holding forces will be available. If number is negative, more holding resources are needed to control potential spot fires or slopovers.

APPENDIX #10
POST-PROJECT EVALUATION

Instructions for Completion of Post-Project Evaluation Form

This form is to be completed and submitted for review within 30 days of declaring the project complete.
Block 1 Self-explanatory
Block 2 Copy of the Project Objectives as listed in the Project Plan.
Block 3 Give quantitative results of how well objectives were met, i.e. % of 1 hour and 10 hour fuels removed, % of burn area with fuels reduced, % of area with acceptable/unacceptable scorch, etc.
Block 4 Give a short narrative of problems encountered and suggestions for improving or refining operations and prescriptions i.e. firing pattern, equipment limitations, drought index, effectiveness of barriers.
Block 5 Self-explanatory - for providing feedback to the Program

Block 1)

APPENDIX # 14
Core Area Prescribed Fire
Hazard Rating Guide

Hazard Element Environmental Data	Hazard Probability L	Hazard Probability M	Hazard Probability H	Potential Consequences L	Potential Consequences M	Potential Consequences H
a. Seasonal severity	Energy Release Component below 90th percentile levels.	Energy Release Component at or above 90 th percentile levels – above average drought conditions.	Energy Release Component at or above 97th percentile levels – severe drought conditions.	Low probability for problematic fire behavior or difficulty in holding activities.	Some potential for problematic fire behavior or difficulty in holding activities.	High probability problematic fire behavior and difficulty in cont
b. Fire Behavior	Flame lengths confined to surface fuels, spread rates low.	Flame lengths extending into shrub and tree regeneration, spread rates moderate.	Flame lengths highly variable, frequently involving individual tree crowns, spread rates moderate to fast.	Low probability of difficulty in holding fire or for adverse fire effects.	Some potential for fire behavior to approach upper prescription limits and cause undesirable effects.	High potential f fire behavior to create holding problems, exce prescription ranges, and ca undesirable eff
c. Fuels	Surface fuels light with open tree canopies, small shrub component present.	Surface fuels moderate with variable forest stand density and moderate shrub presence.	High surface fuel loading with dense shrub component and dense stands with abundant regeneration.	Fuels present no specific implementation problems.	Fuels will have a marked effect on implementation activities and holding force requirements.	Fuels will dramatically aff management organization ar qualifications fo implementation
d. Weather	Weather stable, winds light and predictable, no frontal activity.	Weather slightly variable, winds present but light, occasional gusts, no frontal activity.	Weather highly variable, winds near prescriptive limits, gusts prevalent, frontal activity possible.	Little impact on implementation.	Weather variation will require mitigation actions involving additional resources.	Weather will se as a major influence on organization, personnel qualifications, a specific implementation actions.
e. Topography	Low variability in slope and aspect.	Some variability in slope and aspect, will affect fuel moisture and fire behavior.	High variability in slope and aspect, major implications on fire behavior and must be considered in prescription development and implementation.	Little influence on burn implementation.	Consideration of topography during planning process is necessary.	Topography wil necessitate mitigation actio to be develope and firing patte and ignition methods to be modified to red impacts.

337

Agency Values						
a. Ecological and Environmental Considerations	Fire poses little threat to cause adverse effects or long- term disturbances to natural resource values. No T and E species or critical habitat.	Fire poses moderate threat of adverse effects on natural resources and may cause short- to mid- term alterations or inconveniences such as air quality. Small amounts of T and E species present.	Fire poses high potential for adverse effects to natural resource values or to cause long- term degradations in air quality. Some T and E species present and/ or critical habitat.	Low probability for adverse impacts and little need for mitigation actions.	Mitigation actions may need to be developed to ensure desirable outcomes. Some short- term effects may have to be accepted.	Prescribed Fire Plan must addr mitigation actio to prevent undesirable outcomes.
b. Social and Cultural Values	No known social or cultural values in or adjacent to the project area.	Features of social or cultural value have been identified in and adjacent to the project area. Mitigation measures can be accomplished.	High social or cultural values have been identified in or adjacent to the project area. Mitigation actions are difficult to accomplish.	Severe fire behavior or fire outside the unit would not damage the identified values.	Severe fire behavior or fire outside the unit poses potential for moderate damage to special values. Concerned parties are aware and supportive of the project.	Excessive fire severity or fire outside the unit have adverse effects (substa damage to or potential destruction of t special sites). Acceptance by concerned part is low.
c. Project Duration and Logistics	Fire planned to be of short duration, logistical needs easily accommodated.	Fire planned to be of short to moderate duration, logistical needs pose some difficulty.	Fire planned to be of moderate to long duration, logistical needs create much difficulty in accomplishing.	No consequences because of duration or logistics.	Duration may impact firefighters and public and logistical needs must be specifically addressed.	Long duration f necessitates greater informa dissemination, mitigation to remove impact firefighters and public, and logistical needs must be met or project postpor
d. Smoke and Air Quality Management	Few smoke sensitive areas near project area. No potential scheduling conflicts with cooperators.	Multiple smoke sensitive areas, mitigation actions minimize impacts, low potential for scheduling conflicts.	Multiple smoke sensitive areas near burn area, mitigation actions unable to remove all impacts, duration increases impacts, high potential for scheduling conflicts.	No adverse smoke consequences.	Mitigation actions must address smoke impacts, and coordination is required to confirm scheduling.	Mitigation actio must be develo regulatory ager must concur, scheduling con may restrict implementation

Hazard Element	Hazard Probability L	Hazard Probability M	Hazard Probability H	Potential Consequences L	Potential Consequences M	Potential Consequences H
Public Values						
a. Land use values	No commercial or agriculture activities near planned burn area.	Some commercial or agricultural activities near burn unit, some managed wildlands (recreation, timber, range values).	Planned burn directly adjacent to urban, commercial, and/ or agriculture areas.	No impacts from land use values.	Escaped fire onto nearby managed land causes some impacts to commercial values. Prescribed Fire Plan must consider actions to prevent fire movement onto commercial and/ or agriculture lands.	Escaped fire or nearby manage land causes significant impa to commercial values. Mitigati actions must re additional reso needs to protec urban, commer and/ or agricult areas. If mitiga cannot be accomplished, must be postponed.
b. Dwellings	No permanent or part-time residences present in area.	Some residences ½ mile or less from burn area.	Planned burn is located in wildland-urban interface zone, permanent residences in close proximity.	No impacts from dwellings.	Plan must address actions to ensure adequate protection of residences.	Notification of a concerned homeowners, residents, and visitors, coordination wi local fire protec organizations i needed, and mitigation actio must adequate address potent fire escapes.
c. Non-dwellings	No non- dwellings present.	Some outbuildings and non- residences ½ mile or less from burn area.	Commercial structures in close proximity to burn area.	No impacts.	Planning must consider these non- dwellings.	Planning and implementatior must adequate address all measures to prevent any adverse impac

Human Factors						
a. Firefighter	Little firefighter exposure.	Some firefighter exposure due to fire duration and smoke.	Potential for high firefighter exposure to smoke during burn and to fire during holding actions.	No specific problems, implement standard safety measures.	Mitigation measures to eliminate smoke exposure.	Mitigation measures mus address smoke exposure, use mechanized equipment to eliminate expos to fire.
b. Public	No public exposure.	Some public exposure, mitigation actions can remove/ minimize exposure.	Public may be exposed to high smoke concentrations for moderately long periods, especially during nighttime hours.	No adverse consequences anticipated.	Mitigation actions necessary to provide for maximum public safety.	Mitigation actio must be develo coordinated wit other emergen organizations a fully understoo prior to ignition
c. Fire Management	No problems with commitment and acceptance by park staff members.	No problems with commitment but some unwillingness to support and prioritize the prescribed fire over other activities.	Park staff not committed to using prescribed fire as a tool and not willing to support and prioritize prescribed fire over other activities.	No adverse consequences.	Park staff must be briefed on need and importance of prescribed fire.	Park managem team must be informed of prescribed fire objectives, sup needs, and pric

4.6 U.S. Fish and Wildlife Service Burn Plans

PRESCRIBED FIRE PLAN

Refuge or Station: Mingo National Wildlife Refuge

Unit: Sifford

Prepared By: ______________________________ Date: ______
Thad Herzberger, Prescribed Fire Specialist

Reviewed By: ______________________________ Date: ______
Richard Speer, Refuge Operations Specialist

Reviewed By: ______________________________ Date: ______
Clifford Berger, Region 3, South Zone Fire Management Officer

The approved Prescribed Fire Plan constitutes the authority to burn, pending approval of Section 7 Consultations, Environmental Assessments, or other required documents. No one has the authority to burn without an approved plan or in a manner not in compliance with the approved plan. Prescribed burning conditions established in the plan are firm limits. Actions taken in compliance with the approved Prescribed Fire Plan will be fully supported, but personnel will be held accountable for actions taken which are not in compliance with the approved plan.

Approved By: ______________________________ Date: ______
Kathleen A. Burchett, Refuge Manager

Valid Until ____________

Prescribed Fire Plan Implementation

To be completed prior to the burn. Attach additional copies of this page to the burn plan as necessary.

DELEGATION OF AUTHORITY

(To be completed only if the Burn Boss is NOT a U.S. Fish and Wildlife Service employee)

Effective this date, ________________________ is hereby delegated the authority to execute this approved prescribed burn plan subject to the stipulations listed below under ABurn Boss Concurrence@.

____________________________________ ____________________________________ __________

__Refuge Manager/Agency Administrator Date

Burn Boss Concurrence

(To be completed in all cases)

As the burn boss who will conduct this prescribed burn, I certify that I have reviewed this Prescribed Fire Plan, that conditions described in this Plan are substantially still the same, and I believe the prescribed burn can meet the planned objectives when carried out according to this Plan

I also understand that:

S Any changes to this plan must be approved by the Agency Administrator or his/her acting in writing

S ALL questions on the Go/No Go Checklist must be honestly answered AYes@ before the burn proceeds

S The execution of this plan shall be halted if the prescribed burning conditions established in the plan are no longer present.

S I am responsible for all aspects of the burn until relieved by the Agency Administrator or his/her acting.

I accept the responsibility of conducting this burn.

Prescribed Fire Burn Boss

PRESCRIBED FIRE PLAN

Refuge: Mingo NWR | Refuge Burn Number: Sifford

Sub Station: None | Fire Number: ______

Name of Area: Grazing unit 19 (N & S) | Unit No.: None

Acres To Be Burned: 95 acres | Perimeter Of Burn: ______

Legal Description: Lat. N 36° 56.40' Long. W 090° 14.5'

Township T27N Range R7E Section 31

County and State: Wayne Co., Missouri

Is a Section 7 Consultation being forwarded to Fish and Wildlife Enhancement for review? Yes (**NO**) (circle).

I. GENERAL DESCRIPTION OF BURN UNIT

Physical Features and Vegetation Cover Types:

- The Sifford Unit is located on Mingo NWR, and consists of a north unit (Sifford North) and a south unit (Sifford South). The two units are separated by a narrow bottomland hardwood corridor. Sifford North is a 40 acre burn unit, and Sifford South is a 55 acre burn unit.
- Access to this unit can be gained from 2 locations, one from the east, and one from the west. The western access is via Highway "T", which runs east and west about .5 miles south of the unit. The eastern access is via Spillway Road (an interior refuge road) which runs east and west adjacent to the unit. Both access routes meet on the south boundary of the unit. The south boundary is an old railroad levee covered in short grasses such as fescue (*Festuca spp.*). The western access route crosses private land, and prior approval to use this access has been obtained.
- The unit consists of primarily fescue and broomsedge.

Primary Resource Objectives of Unit:

- Prescribed fire will be used to promote and improve conditions for native prairie grasses to increase wildlife habitat values.
- Fire will also be used to remove undesirable exotic grass and forb species within the unit and promote growth of desirable prairie grass species.

Objectives of Fire:

- Consume 80% of dead/dormant vegetation on site.
- Promote growth of desirable prairie species.
- Stress or kill exotic species within the burned portion of this unit.

Acceptable Range of Results:

- Burn coverage should be ≥90%.
- Burn ≥60% of populations of cool season exotic species.

Type of Transects:

- No transects will be established.

Photo Documentation:

- Pre and post-burn photographs will be up to station personnel.

II. Pre-Burn Monitoring

Vegetation Type	Acres	%	FBPS Fuel Model
Tallgrass fescue and broomsedge	95	100	FM 3 Tallgrass
Total	95	100	

Complexity Worksheet

Station Mingo National Wildlife Refuge **Burn Unit Name** Sifford

Element	Sub Element	Rating Value (L-M-H)		Rationale
Potential for Escape	**Risk**	Preliminary	L	Potential for escape is slight, due to the adjacent bottomland hardwood, and adequate ATV/ sprayer access along the entire perimeter.
		Final	L	All sides of the units will be mowed breaks, 15-20 feet wide.
	Potential Consequences	Preliminary	L	An escape would result in very little damage. All sides of the unit are bordered by bottomland hardwood, that would unlikely carry fire. The units are surrounded by refuge land.
		Final	L	No Change
	Technical Difficulty	Preliminary	L	Holding on this prescribed fire will be supervised at the Firefighter Type II level. The entire perimeter of the burn will be accessible by ATV w/ sprayer.
		Final	L	No Change.
Number & Dependency of Activities	**Risk**	Preliminary	L	Ignition will be carried out using two igniters working in opposite direction from one another, starting on the upwind side. All ignition activities will be coordinated by the burn boss. Holding crews will be within eye sight of one another throughout the burn.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	The burn boss will supervise the ignition sequence and coordinate the holding crews to mitigate any potential safety problems.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	Since all crew members will be within eye sight of one another, minimal difficulty in coordination will occur. The holding crews and igniters will coordinate the rate of ignition dependant on holding difficulty.
		Final	L	No Change.
Off-Site Values	**Risk**	Preliminary	L	All adjacent land is refuge bottomland hardwood. Minimal damage would result from an escape fire, and the burned fuels would recover quickly.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	In the case of an escaped fire on refuge land, burned fuels will recover quickly and cause minimal damage.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	Protection of off-site values requires no special management, equipment, or skills.
		Final	L	No Change.
On-Site Values	**Risk**	Preliminary	L	There are no internal features present that require special attention in planning or implementation.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	There are no internal features to be adversely affected by this burn.

		Final	L	No Change.
	Technical Difficulty	Preliminary	L	No special skills or operating procedures are required.
		Final	L	No Change.
Fire Behavior	Risk	Preliminary	L	This burn unit is representative of Fuel Model 3. Fire behavior could be high, but short in duration. The terrain is flat and should pose no control problems within the prescription parameters.
		Final	L	No change
	Potential Consequences	Preliminary	L	Fire behavior outside of the unit would be less than that experienced within the unit. Under most conditions, fire behavior intensity would decrease in the adjacent bottomland hardwoods.
		Final	L	The unit boundaries consist of 15-20 foot mowed fire breaks. A type VI engine will be able to access the western boundary, and ATV's will have access to the entire perimeter. Holding should not pose a problem.
	Technical Difficulty	Preliminary	L	Standard fire safety precautions are adequate to ensure personnel safety. The potential for slopovers is low due to the fuel type and mowed fire breaks surrounding the unit. Spotting potential is low, due to the adjacent bottomland hardwood fuel type.
		Final	L	No Change.
Management Organization	Risk	Preliminary	L	A burn boss with a crew size of no less then 4 qualified firefighters is necessary to safely implement this prescribed fire.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	No major problems related to supervision or communication is expected due to the small size of the crew and unit.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	The primary fire crew will consist of local unit personnel. No special supervision is required. All crew members will be briefed on safety, communication, and ignition procedures.
		Final	L	No Change.
Public & Political Interest	Risk	Preliminary	L	This burn unit is located near the southwest boundary of the refuge. There has been no public or political controversy related to prescribed burning on the refuge
		Final	L	No Change.
	Potential Consequences	Preliminary	L	In the event that the fire would escape the unit; little if any public, political, or media attention would result.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	No special notifications to the media will be needed.
		Final	L	No Change.
Fire Treatment Objectives	Risk	Preliminary	L	Fire treatment objectives for this unit consist of reducing duff, reducing exotic species, and promote native prairie grass species.

		Final	L	No Change.
	Potential Consequences	Preliminary	L	If unit is not burned before spring green-up, the objectives may not be met.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	Standard hand held drip torches will be used to ignite the unit. Standard burn techniques should easily accomplish objectives.
		Final	L	No Change.
Constraints	Risk	Preliminary	L	There are no special constraints related to access, water sources, firelines, specific tactics, or equipment use.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	There are no major constraints on the timing of this burn except for the time of the year in which the project should be accomplished. An early spring burn is most suitable at this time.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	Constraints do not increase the difficulty of this prescribed fire.
		Final	L	No Change.
Safety	Risk	Preliminary	L	Safety issues mainly consist of footing along fire breaks, snakes and reptiles, and hazards associated with vehicles and ATV operation.
		Final	L	These issues are easily identified and mitigated in the pre-burn briefings.
	Potential Consequences	Preliminary	L	The potential for serious accidents/injuries to firefighters during the burn would be minimal.
		Final	L	To mitigate the potential safety issues around the unit, the ATV operator(s) will scout the ignition route prior to the actual burn. Only properly trained personnel will operate ATV'(s). All fire equipment will have the headlights on to be as visible as possible.
	Technical Difficulty	Preliminary	L	Safety concerns can be easily mitigated through LCES and will be covered in the pre-burn briefing.
		Final	L	No Change.
Ignition Procedures Methods	Risk	Preliminary	L	Firing sequence and timing are not critical to meet burn objectives. The entire burn unit is readily visible to the burn boss. A well-established black line will be in place on the downwind side before proceeding along the flanks.
		Final	L	No Change
	Potential Consequences	Preliminary	L	Firing methods and procedures must be coordinated to provide for adequate safety and to reduce the risk of an escaped fire situation. This coordination must be handled by the burn boss.
		Final	L	A very detailed briefing explaining the firing sequence will be given. Also all crew members will have an opportunity to walk the perimeter of the unit prior to ignition.
	Technical Difficulty	Preliminary	L	Ignition techniques and sequences will be discussed in detail during the briefing. All personnel on the burn will have hand-held radios, or be working in tandem with someone who does.
		Final	L	No Change.

Interagency Coordination	**Risk**	Preliminary	L	The project does not involve another land management agency.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	Burn can be completed as planned.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	No Interagency issues
		Final	L	No Change.
Project Logistics	**Risk**	Preliminary	L	This project requires minimal logistical support and most supplies needed to conduct the burn are readily available. No special equipment or communication needs will be required. Project should be completed in one day.
		Final	L	No Change.
	Potential Consequences	Preliminary	L	Problems related to logistics will not increase the risk of escape or affect the completion of the project.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	No special logistical support issues and supplies and personnel are readily available and easily obtained.
		Final	L	No Change.
Smoke Management	**Risk**	Preliminary	M	This unit is bordered by the Refuge's Wilderness area on the West, North, and East sides. .Impacts of smoke on the Wilderness area will be minimal. The wilderness is a smoke sensitive area, but the smoke concerns are limited due to the short burn duration of this fuel model and the small size of the unit.
		Final	L	Potential problems will be mitigated by burning only smaller sections of the unit on different burn days and conducting mop up as needed, to eliminate residual smoke issues.
	Potential Consequences	Preliminary	L	The implementation of this project should have no impact on public residences or roads. Firefighter exposure to smoke is expected to be minimal due to the lack of holding associated with the man-made firebreaks and should not cause any health and safety concerns. Firefighters will be rotated in and out of heavy smoke areas.
		Final	L	No Change.
	Technical Difficulty	Preliminary	L	This project will require no special operational procedures to provide for smoke management. There will be limitations on wind directions, mixing heights, and dispersal rates to minimize impacts to smoke sensitive areas.
		Final	L	No Change.

SUMMARY COMPLEXITY RATING

RISK OVERALL RATING ____Low___

POTENTIAL CONSEQUENCES OVERALL RATING ____Low_

TECHNICAL DIFFICULTY OVERALL RATING _____Low____

SUMMARY COMPLEXITY RATING ___Low__

RATIONALE: This project rates at a Low complexity due to adequate fire breaks on all sides that are easily accessible with an ATV(s) with sprayer(s). All elements rated a low complexity due to the low potential for escape, values at risk (on and off-site), public and political interest, constraints, interagency coordination, logistics, and smoke management.

Prepared by: ____**Date:** _______________
Thad Herzberger, Prescribed Fire Specialist

Approved by: ____ **Date:** _______________
Clifford Berger, Region 3, South Zone Fire Management Officer
(Agency Administrator)

III. PLANNING AND ACTIONS

Complexity Analysis Results:

- This is a low rated complexity burn requiring at minimum a Prescribed Fire Burn Boss Type III.

Site preparation:

- Fire breaks will be mowed with a tractor and bushhog-type mower deck. Fire breaks will be at least 15 feet wide. If possible, a disked line will be established in conjunction with the mowed line. The ATV operator(s) and burn boss will scout the unit to check for potential hazards.

Mowed Firebreaks:

- A mow line will be completed on the all sides of the unit. The levee that serves as the western boundary will also be mowed.
- The mow lines will be approximately 15 feet wide and will be installed by refuge personnel just prior to ignition.

Weather Information Required:

- The Burn Boss will request a spot weather forecast the morning of the scheduled burn from the National Weather Service in Paducah, KY (270)744-6440 or via the internet @ www.crh.noaa.gov/pah/forecast/firewx.shtml . In addition, a general fire weather forecast can be obtained via the internet @ www.crh.noaa.gov/pah/forecast/firewx.shtml . The general fire weather forecast should not replace the required spot weather forecast. Information regarding fronts, inversions, wind speed, direction and changes will be used to determine if weather will meet prescription. On site weather information (wind speed and direction, temperature, and relative humidity) will be collected just prior to ignition. If information is inconsistent with the weather forecast, another spot weather forecast will be obtained from the National Weather Service.

Safety Considerations and Protection of Sensitive Features:

- No sensitive features within the unit.

Special Safety Precautions Needing Attention:

- Crew members will need to be constantly aware of what and where the ignition team and holding forces are. Constant communication between ignition crews and the burn boss will be essential to safely and efficiently complete this burn.
- It will be important to establish minimally adequate control line width (100') on downwind perimeter of unit to prevent potential spot-overs.
- Only qualified personnel will operate ATV(s).

Special Constraints and Considerations: None

Burn Day Contacts:

Name Address (if required)	Phone Number	Date of Contact	Time of Contact
Stoddard County Sheriff (911)	573-568-4654		
Puxico VFD	573-222-3162		
Wappapello VFD	573-222-8475		
Mingo Job Corps	573-222-3537		
Wayne County Sheriff	573-224-3219		
Zone FMO (Cliff Berger)	217-224-8580 217-242-8583c		
Prescribed Fire Specialist (Thad Herzberger)	618-997-3344x322 618-889-6269c		

Communication and Coordination on the Burn:

- Crew members will carry handheld radios on the burn.
- Engines will be equipped with mobile radios.
- Radio communication will be on Channel 1 (Refuge Repeater A)
- Plain text will be used at all times.
- Burn boss will brief crew and coordinate all activities.
- If some crew members do not have radios, they will be paired with a member who does.

COMMUNICATIONS PLAN

FIRE COMMUNICATIONS CHANNELS AND FREQUENCIES FOR MINGO NWR					
Channel	Name	Rx Frequency	Code	TX Frequency	Code
1	Refuge Car/Car Repeater A	164.625		163.150	
2	Repeater D	164.625		163.150	1A
3	Gipsy	151.190		159.345	5A
4	Mutual Aid	155.475		155.475	
5	Civil Defense	155.145		155.145	
6	Stoddard County	155.190		159.030	2B

Medical Plan

Medical Emergency Procedures
Brief Description: In case of injury needing immediate medical attention, the burn boss or designated fire crew member will contact County Dispatch Office (911) for dispatching of nearest ambulance. The nature of injury will need to be conveyed from burn site through dispatchers to ambulance crew to insure proper response. If the nature of the injury requires medi-vac to trauma or burn center request air ambulance from St. Louis through dispatchers. Allow ambulance crew to coordinate communications with air ambulance.
Ambulances

Name	Address	Phone Number	Paramedics Yes	No
Stoddard County		624-8951		
Wappapello		222-8250	X	

Air Ambulances				
Name	Address	Phone Number		
AIR-EVAC	Poplar Bluff	1-800-247-3822		

Hospitals			
Name Helipad	Location	Phone Number	Travel Time (Air/Ground)
Three Rivers	Poplar Bluff	573-727-2566	15min/40min
St. Francis Medical Center	Cape Girardeau	573-331-3000	25 min/60/min

Nearest Burn Center		
St. Louis Burn Center 35 minutes by air		
Supplies on Board		
<u>Item</u>	<u>Location</u>	<u>Person Responsible</u>

Medical Emergencies

In the event that a medical emergency beyond the capability of the people on site occurs, **911** or calling County dispatch needs to be initiated, identifying the extent of injuries, location, access and contact person on site. This can be done through the Refuge office dispatcher. First aid will be administered on site, and the Burn Boss will determine if the burn operation can safely continue without jeopardizing the well being of the injured party or the safety of the remaining firefighters.

IV. IGNITION, BURNING AND CONTROL

	Planned or Proposed	Actual
Scheduling: Approx. Date(s)	Jan. 15 – Apr.15 Oct.15 - Dec.15	
Time of Day	0900-1800	

Acceptable Range

FBPS Fuel Model 3	Low Fire Behavior	High Fire Behavior	Actual
Temperature	30	90	
Relative Humidity	65	25	
Wind Speed (20' forecast)	2	18	
Wind Speed (mid-flame)	2	14	
Wind Direction	All		
Cloud Cover (%)	100	0	
ENVIRONMENTAL CONDITIONS			
Soil Moisture	N/A	N/A	
1 hr. Fuel Moisture	15	5	
10 hr. FM	N/A	N/A	
100 hr. FM	N/A	N/A	
Woody Live Fuel Moisture	N/A	N/A	
Herb. Live Fuel Moisture	N/A	N/A	
Litter/Duff Moisture	N/A	N/A	
FIRE BEHAVIOR			
Type of Fire (H,B,F)	BACKING	HEAD	
Rate of Spread	25	482	
Fireline Intensity	283	6926	
Flame Length	6	26.3	

Cumulative effects of weather and drought on fire behavior:

- Prolonged drought will cause drying of larger fuels and possibly litter, duff, and soil layers which do not normally burn. The fuel models do not account for these fuels burning. With a drought situation, you can expect higher flame lengths, highly increased fireline intensity, resistance to control efforts, prolonged smoldering of large logs and duff layers, difficult mop-up, and lingering smoke problems.
- Wet areas that you were counting on as a barrier may be much lower than necessary to conduct a safe burn. Water sources may be dried up.
- Drought will have much less effect on grasses (FBPS fuel model 1 and 3) since fuels are composed mostly of 1-hour fuels which will be more affected by temperature and relative humidity than prolonged drought.
- Spring burning often has wet woody fuels from winter precipitation. If winter precipitation has been below average for the area, consider postponing burning for the season or until after a rain.
- If drought conditions are severe enough you may have to postpone the burn, use additional resources for holding, burn under the low fire behavior conditions within the prescription, and monitor fire behavior more closely.

Where to get information on cumulative drought conditions

- Monitor whether precipitation is below normal at your station (But be careful - precipitation can be above normal for the year, but BELOW normal for the last 4 or 5 months, leading to abnormally dry conditions)
- Nearby automated weather stations will probably calculate fuel moistures and NFDRS (National Fire Danger Rating System) indices which indicate what the burning conditions are for a general area.
- The nearest fire dispatch may have current conditions including what the live fuel moistures are doing
- The ERC (Energy Release Component) is a good indicator of when burning conditions are getting severe. Many refuges use the Burning Index - another NFDRS output, but it fluctuates more rapidly than the ERC (not as good for long-term trends)
- Internet - Keetch-Byram drought index, departure from average greenness, Palmer Drought Index are sources that can be accessed for information on regional conditions, sometimes down to county level. This data can be found at the Wildland Fire Assessment System (WFAS) on the Internet
- NRCS may have soil moisture data.
- Some states issue range fire indices daily. Consult with the National Weather Service. These are sometimes available on the Internet.

If you are in drought conditions you may have to do something to mitigate the effects

- Postpone burn
- Have additional holding forces on hand
- Have additional water sources available

- Burn under less severe conditions
- Spend greater effort on mop-up
- Monitor the fire more often to make sure it's out
- IF NOTHING ELSE: make a note that you should consult with your Zone FMO if the nearest weather station is showing below normal precipitation.

Ignition Technique and Sequence: Ignition will be carried out using hand-held drip torch(es). A backing fire will be used to establish blacklines on the downwind side(s) along the firebreak. Ignition sequence will depend on wind direction, working into the wind whenever possible. The actual firing pattern will be decided the day of the burn by the burn boss based on personnel and equipment availability, weather, and fuel conditions.

Test Fire: A test fire will be conducted in the downwind corner of the burn unit. The burn boss will observe the test fire to ensure wind direction and burning conditions are within predicted and required parameters. However, the use of a single test fire at one moment is not sufficient. During all times of active ignition the prescribed fire will be monitored, and will be terminated if objectives and safety requirements are not being met. If conditions are not within these parameters the test fire will be extinguished and burn postponed until conditions allow for continuation. The downwind perimeter will be ignited allowing the fire to back/flank into the wind. A control line of at least a minimum of 100 feet will be established before teams continue with ignition along flanks. Unit will be completed by lighting a head fire on upwind perimeter of unit.

Ignition Teams: Two ignition teams will be used. Both teams will be made up of a driptorch operator, and one person on an ATV w/sprayer, spot checking along the line. Both teams will ignite and hold as they proceed. A **minimum** of 100' of blackline will be established before the teams continue up the east and west flanks. Due to the small size of the unit, the burn boss should have visual contact with both ignition teams at all times. An engine with slip-on unit will be on stand-by on the western boundary. A minimum of 5 personnel (Burn Boss + 4) are required for safe completion of the burn. However, if more personnel are available the day of the burn, they will serve as additional holding resources.

Prescribed Fire Organization (Following is the minimum list of qualified positions and equipment to safely accomplish this burn. If additional personnel and/or equipment are available they may be used to fill various positions at the discretion of the burn boss):

Positions/Equipment	Quantity
RXB3	1

FFT2	4
Equipment	
Floto-pump, Mini Mark, other portable pump (with required hose and fittings)	1(staged)
Type VI Engine	1(staged)
ATV w/ 40gal. sprayer Polaris Sportsman w/ 50gal. sprayer	Must have at least one

Other: Minimum crew size required will be 5 (Burn Boss + 4) for this burn unit. More people will be utilized as holding resources for the prescribed burn, if available.

Prescription monitoring:

- The Burn Boss or a designated fire crew member will take and record on-site weather observations prior to and periodically (as needed) throughout the ignition. These observations along with the spot weather forecast will be used to determine if conditions are within prescription to ignite and continue firing operations.

Holding and Control:

Critical Control Problems: No critical control problems are foreseen. All boundaries are adjacent to bottomland hardwood with moist ground litter and some standing water. Ignition will occur in conjunction with a wetline using the ATV(s) with sprayers. The wetline will be within the mowed line. A pumper unit will be available to assist holding on the line if necessary.

Water Refill Points: The ATV(s) will be able to refill from the Engine stationed on the west levee. The engine will be able to refill using the floto-pump located at Battle Shell Lake (South west of the unit) or at Ditch 10 (East of the Unit).

Contingency Plan for Escaped Fire:

- In the event of a slopover, the Burn Boss will be notified immediately and will decide if it is necessary to continue or cease ignition.
- The slopover will be declared an escaped fire if it can not be contained within an hour with on-site resources or if structures are threatened regardless of the containment time.
- If the slop-over has been considered an escaped/wildfire, the most qualified fire crew member will then assume the role of the Incident Commander. The IC will determine the most

appropriate suppression strategy to contain and control the fire. Direct attack is the preferred method of control and will be used unless otherwise directed by the IC.

- It shall be covered in the briefing the current qualifications and red-card status of the entire fire crew on-site.
- Available holding forces will perform initial attack.
- If additional resources are needed to contain the escape, outside resources can be ordered directly through Puxico or Wappapello VFDs (See contact list for #s).
- If direct attack is not possible, providing protection to life and private dwellings will be the first priority. Indirect attack will be implemented with the use of the contingency map provided. **(See Contingency Map)**

Contingency Plan for Escaped Fire (Are there crews standing by to initial attack or will people doing other jobs be called upon to do initial attack, who must be called in case of an escape, what radio frequencies will be used, etc.)

1. If the fire escapes to the north, direct attack will be used. If this should fail, there are no distinct anchor points within ¾ mile of the unit. The best option would be to tie the Auto Tour Route into Ditch 10 (approximately ¾ - 1 mile north of the unit). The fuel type north of the unit is wet bottomland hardwood, and would not likely carry fire. However, if needed, a short handline from the Auto Tour Route to Ditch 7 which connects into ditch 10, would be sufficient to hold a burnout operation.

2. If the fire escapes to the west, direct attack will be utilized. If this should fail, the Auto Tour Route (runs on the southern boundary of the unit, and then turns to the north about ½ mile west of the unit) can be used as an anchor point for a burnout operation.

3. If the fire escapes to the south, again direct attack will be used. If this fails, the Auto Tour Route can serve as a contingency, to establish an anchor point. If the fire crosses the road, the next potential holding point is an east/west short grass levee approximately 100 yards south of the Auto Tour Route. The vegetation surrounding the levee is representative of Fuel Model 3.

4. If the fire escapes to the east, direct attack tactics will be used. If this should fail the fire crew will fall back and burn out along Ditch 10, which runs north to south, approximately ½ mile to the east.

If fire escapes the following actions will be taken:

A. If fire burns outside the specified perimeter limits, and cannot be quickly contained by on-site resources, the fire will then become a wildfire.
B. All prescribed firing operations will cease.
C. Available holding forces will perform initial attack.
D. The burn boss or highest wildfire qualified individual on site will assume the duties of Incident Commander until relieved.
E. Safety and protection of private property will be the highest priorities.

F. If in the opinion of the burn boss, on-site resources cannot contain the fire, the county dispatch will be contacted.

Contingency resources will be requested via radio or cell phone from **(Wayne or Stoddard County)Dispatch**. Fire resources are available from the Puxico Fire Department, approximately 3 miles from the burn unit. **Communication between the VFD and refuge personnel will be critical. Refuge personnel will provide the VFD's with refuge radios to provide adequate communication!**

Resources at risk:
In the event the escaped fire has the potential to threaten private individuals, structures, livestock, or other non government property, the county dispatch office will be notified with a request for law enforcement to contact home owners and assist with possible evacuation, road closures, and to request structure protection with Volunteer Fire Department structural fire equipment. County dispatch will also be notified should assistance be needed with traffic control and road closings due to hazardous smoke conditions.

Mop Up and Patrol:
All fires will be mopped up and patrolled to mitigate the threat of smoke and/or escape problems. In all cases, each burn will be patrolled a **minimum** of once immediately prior to abandoning for the evening. The unit will be mopped up no less than 100 feet off of the control line. This may be increased if strong winds are forecasted after completion of the prescribed burn at the burn boss' discretion. The unit will be ground checked the next day and additional days if necessary.

V. SMOKE MANAGEMENT

Permits required:
- No Permit Required.

Distance and Direction from Smoke Sensitive areas

Refuge Wilderness Area	Adjacent on the west, north, and east sides
Town of Puxico	East approximately 2-3 miles
Hwy 51	East approximately 3 miles
Hwy T	Southwest approximately 1 mile

Necessary Transport Wind Direction, Speed and Mixing Height:

Transport Wind Speed: minimum 5 mph.
Wind Direction: All directions
Mixing Height: minimum 500 feet.

Test fires will indicate if smoke dispersal and wind direction objectives are being met. Smoke dispersal information will be obtained from the National Weather Service Office as a part of the spot weather forecast.

Visibility Hazards (roads,airports, etc.):
Same as SSA's listed above. Heavy smoke may occur along the perimeter of the burn unit which could directly impact fire crew members.

Actions to Reduce Visibility Hazard(s):

- All burning parameters as specified in this plan will be followed. Planned wind and atmospheric conditions will allow smoke to rise and disperse. The burn will not be conducted with a wind direction which will put smoke directly into the occupied farmsteads that are immediately adjacent to the burn unless the occupant has given permission to do so. Smoke dispersal conditions which allow smoke to lift over farmsteads and roads are acceptable. Smoke management contingency plans will be initiated immediately if needed.
- Mop-up will begin as needed when firing is completed. If needed, mop-up will continue after the burn until all smoke visibility hazards are removed as determined by the burn boss.
- Visibility hazards will be discussed during the pre-burn briefing. Fire engines on the firelines should travel slowly with headlights on at all times. Communication between engine operators and fire line personnel will be maintained for the duration of the burn, and all line personnel will be made aware of equipment movements.
- For all units, use traffic control personnel where necessary and "smoke ahead" signs on any roads where smoke may be a visibility hazard.

Smoke Management Contingency Plan:
If changes in weather conditions or other factors occur that cause imminent smoke problems, the following plan will be initiated:

1) All attempts will be made to reduce smoke emissions from the burn as quickly as possible. This may include immediate shut down of the burn and suppression of any area of the unit still on fire. Mopup will also be initiated in order to eliminate as much smoke production as possible.

2) If additional resources are needed to extinguish the burn and eliminate further smoke production, they will be called in through the refuge dispatch system and may include fire departments, personnel from other refuges, or other state and federal agencies in the area.

3) Smoke signs following DOT requirements should be placed prior to the burn on roads that may be impacted by smoke, traffic control should be initiated by a burn crew member with communications

with a traffic controller and the burn boss. The county sheriff or other law enforcement personnel may be called to assist with local traffic control, including temporary closure of area roads if deemed necessary.

4) If it appears that smoke from the burn will impact local communities or other smoke sensitive locations, all efforts will be made to identify the potential problem areas and inform the public so that local actions to reduce impacts such as closing up buildings and moving sensitive individuals away from the impacted area can occur.

5) The burn boss will remain on site until the smoke problems are resolved or until relieved by an individual appointed by the line officer.

Personnel involved in traffic monitoring and control should wear high-visibility safety vest and should use a vehicle with emergency warning lights when available.

Residual Smoke Problems:

- Residual smoke will be limited due to the short residency time of grass fuel models. Where holdover smoke may be a concern, rapid and complete mop-up will be completed. Attempts will be made to complete the burn prior to sunset to prevent as much residual smoke as possible.

Particulate emissions in Tons/Acre and how calculated: N/A

VI. FUNDING AND PERSONNEL

RX Project Cost Estimate: (Budget Estimate. A matrix which provides an estimate and will capture the actual expenses will be used. Capture all costs associated with the project relate to FIREBASE.)

Category	Phase				Total
	Crew Size	**Regular hours**	**Avg. wage**		
Burn Crew	5	40	20.00	0	800.00
Administration	1	10	19.00	0	190.00
Site Prep.	1	3	19.00	0	57.00
Travel/ Per Diem	n/a	n/a	n/a	n/a	

Equipment (Admin., Site prep, Ignition & Control)				0	525.00
TOTAL				0	1572.00

Estimated Cost Per Acre ___
9263 Funds Requested 1572.00 ___
Other Funds Requested 0.00

VII. BURN DAY ACTIVITIES

Crew Briefing Points:
A thorough briefing emphasizing all hazards, escape routes, and any special considerations relative to the burn will be discussed on site prior to ignition. All crew members will have maps of the unit. This will include a drive around review with all crew. The Go-No-Go checklist will be completed prior to the burn.

Prescribed Burn Briefing Outline attached.

- Park all vehicles in a safe area, pointed away from fire. Leave keys in the ignition and close all windows.
- Provide for plenty of drinking water, juices or other non-caffeinated drinks. Rotate ignition crews when necessary.
- Limit exposure of personnel to smoke and CO exposure, rotate personnel.
- Always keep track of personnel working next to you, and make your where-abouts known when you change positions.
- Give clear and concise instructions, and make sure they are understood.
- Wear proper PPE and keep shirt sleeves down.
- Avoid spilling fuel on PPE. Fill torches and fuel containers ONLY on the ground. Label and date all fuel containers.
- Communicate any changes in weather or other significant events to burn boss immediately.
- Make sure everyone is on the correct radio channel .

Personnel Escape Plan:
- Safety zones for this unit will include; black, grazing fields, areas of no or light fuel, open water, and roadways.
- Escape routes will include; black, areas with no fuel or light fuel, roadways and open water.
- It will be the responsibility of every individual that they have escape routes and safety zones picked out at all times.

Special Safety Requirements:
- ATV operators will have agency determined 'ATV Operators Course'.

Rehabilitation Needs:-None anticipated

DI 1202 Submission Date:

Special Problems:

See attached Go-No-Go checklist.

Prescribed Burn Briefing Outline

I. **Burn Organization**
   A. Organizational Chart/Personnel Assignments
   B. Equipment Assignments
   C. Other Resources
II. **Burn Objectives**
III. **Description of Burn Area**
   A. Review Map of Burn/Topographical Features/Acreage
   B. Values at Risk
   C. Problem Areas
   D. Fuel Type (Both Inside and Outside the Burn Unit)
   E. Roads/Access
   F. Water Sources
   G. Natural/Manmade Barriers
IV. **Expected Weather**
   A. Wind Direction and Speed
   B. Relative Humidity
   C. Temperature
   D. Fuel Moisture
   E. Atmospheric Stability
   F. Predicted Changes
V. **Communications**
   A. Procedures
   B. Frequencies/Channels
      1. Burn Crew
      2. Dispatch
      3. Cooperators
      4. Others
VI. **Firing Sequence**
   A. Test Burn
   B. Ignition Equipment (Type, Number, Etc.)
   C. Pattern and Sequence of Firing (Map)
VII. **Contingency Plan**
   A. Slop Over vs. Escape
   B. Assignments/Organizational Chart
   C. Strategy
   D. Tactics
VIII. Safety
   A. Inspect Personal Protective Equipment

B. Lookouts, Escape Routes and Safety Zones
C. Hazards (Footing, Natural, Man made, Smoke [visibility], Etc.)
D. Potential Problems
E. Other (Air Operations, Flammable Fuel Handling, Etc.)

GO-NO-GO CHECKLIST

Unit: Sifford Pasture

Yes___ No___ Do you have an **APPROVED** prescribed fire plan?

Yes___ No___ Are **ALL** fire prescription elements met?

Yes___ No___ Are **ALL** smoke management specifications met?

Yes___ No___ Are **ALL** permits and clearances obtained?

Yes___ No___ Has an area spot weather forecast been obtained and is it favorable?

Yes___ No___ Are **ALL** required personnel in the prescribed fire plan on site?

Yes___ No___ Has the contingency planning process adequately considered fuels adjacent to and within a reasonable proximity to the burn area?

Yes___ No___ Has the availability of **ALL** contingency resources been checked, and are they available?

Yes___ No___ Have **ALL** personnel been briefed on the project objectives and their assignment?

Yes___ No___ Have **ALL** personnel been briefed on their safety hazards, escape routes, and safety zones?

Yes___ No___ Have **ALL** the required notifications been made?

Yes___ No___ Are the on-site holding forces adequate for containment under the expected conditions?

Yes___ No___ In **YOUR OPINION**, can the prescribed fire meet the planned objectives, and can it be carried out according to the approved plan?

I certify that I have reviewed the burn objectives and that I am in agreement that the Prescribed Fire Complexity Analysis is correct and that all the above questions were answered "**YES.**"

Appendix B: Prescribed Fire Plan Template

A standardized, reproducible template form for the Prescribed Fire Plan development process is included in this appendix. A standardized format is provided for the Prescribed Fire Plan in PDF. An electronic version editable in Word is also available. Users should prepare the plan using the electronic version.

In the electronic Word version, the Project Name and/or Unit Name should be entered in the document's header which will automatically appear on each following page of the plan.

To insert information into the document's header:

1. Double-click in the header region (upper region of each page displayed on the screen).
2. Type Project and/or Unit information.
3. Double-click *outside* the header region in the body of the document.

You may also access the header under **View** > **Headers and Footers**. This will open the header region for edits automatically. After entering the information, go again to **View** > **Headers and Footers** which will return you to being able to enter information into the body of the document.

COMPLEXITY RATING: ______________

APPROVED BY: ______________________________ **DATE:** __________

Agency Administrator

Project Name: ______________________________

Unit Name: ______________________________

ELEMENT 2: AGENCY ADMINISTRATOR PRE-IGNITION APPROVAL CHECKLIST

Instructions: The Agency Administrator's Pre-Ignition Approval is the intermediate planning review process (i.e. between the Prescribed Fire Complexity Rating System Guide and Go/No-Go Checklist) that should be completed before a prescribed fire can be implemented. The Agency Administrator's Pre-Ignition Approval evaluates whether compliance requirements, Prescribed Fire Plan elements, and internal and external notifications have been or will be completed and expresses the Agency Administrator's intent to implement the Prescribed Fire Plan. If ignition of the prescribed fire is not initiated prior to expiration date determined by the Agency Administrator, a new approval will be required.

YES	NO	KEY ELEMENT QUESTIONS
		Is the Prescribed Fire Plan up to date? *Hints: amendments, seasonality.*
		Will all compliance requirements be completed? *Hints: cultural, threatened and endangered species, smoke management, NEPA.*
		Is risk management in place and the residual risk acceptable? *Hints: Prescribed Fire Complexity Rating Guide completed with rational and mitigation measures identified and documented?*
		Will all elements of the Prescribed Fire Plan be met? *Hints: Preparation work, mitigation, weather, organization, prescription, contingency resources*
		Will all internal and external notifications and media releases be completed? *Hints: Preparedness level restrictions*
		Will key agency staff be fully briefed and understand prescribed fire implementation?
		Are there any other extenuating circumstances that would preclude the successful implementation of the plan?
		Have you determined if and when you are to be notified that contingency actions are being taken? Will this be communicated to the Burn Boss?

Approved by: ______________________________ Date: __________

Agency Administrator

Approval expires (date): ______________________________

Project Name: ______________________________

Unit Name: ______________________________

ELEMENT 2: PRESCRIBED FIRE GO/NO-GO CHECKLIST

	YES	NO
A. Has the burn unit experienced unusual drought conditions or contain above normal fuel loadings which were not considered in the prescription development? If NO proceed with checklist., if YES go to item B.		
B. If YES have appropriate changes been made to the Ignition and Holding plan and the Mop Up and Patrol Plans? If YES proceed with checklist below, if NO STOP.		

YES	NO	QUESTIONS
		Are ALL fire prescription elements met?
		Are ALL smoke management specifications met?
		Has ALL required current and projected fire weather forecast been obtained and are they favorable?
		Are ALL planned operations personnel and equipment on-site, available, and operational?
		Has the availability of ALL contingency resources been checked, and are they available?
		Have ALL personnel been briefed on the project objectives, their assignment, safety hazards, escape routes, and safety zones?
		Have all the pre-burn considerations identified in the Prescribed Fire Plan been completed or addressed?
		Have ALL the required notifications been made?
		Are ALL permits and clearances obtained?
		In your opinion, can the burn be carried out according to the Prescribed Fire Plan and will it meet the planned objective?

If all the questions were answered "YES" proceed with a test fire. Document the current conditions, location, and results

4.7 U.S. Army Corp of Engineers Burn Plans

U.S. ARMY CORPS OF ENGINEERS

HARRY S. TRUMAN DAM & RESERVOIR

PRESCRIBED BURN PLAN

PROJECT DESCRIPTION	
Area/Field, Stand or Unit No.: Browington Switchgrass Lease Unit D-15/16	
Prepared by: Jason Hurley	**Date:** NOV-9-2006
RX Burn Boss approval:	**Date:**
Location description (attach map): Henry Co. T40 - R25W - Section 17,18,20	
Acreage: 160	
Site description: native switchgrass prairie, annual weeds, woody invasion.	
Sensitive areas: Private pasture and the village of Browington to the west; private wooded property to the south	
Risk Assessment Value (attach Risk Assessment Worksheet): 15	

PRESCRIPTION			
Burn objectives: To burn >95% of the unit. Top kill 85% of woody plants <5ft tall. Stimulate native forb growth for the following growing season.			
Preferred timing: Feb. 15th to May 15th.			
Desired fire behavior: Use a ring head fire method to burn the unit. > 95% of fuel is consumed.			
Conditions needed:		Range	Ideal
	Temperature	40 – 80 deg. F.	65
	Relative humidity	25 – 50%	35%
	1 hr. fuel moisture	3 – 7%	5%
	10 hr. fuel moisture		
	Midflame windspeed	3 - 15	8
	Wind direction	Any except east	Southwest

Smoke management:

Desired atmospheric conditions:Unstable atmospheric conditions preferred for smoke dispersal.

Mixing height (>1650' recommended):

Ventilation rate (>6000 m^3/sec recommended):

Air quality restrictions that apply: **None for Henry Co.**

Firelines: Wheat or mowed fireline along west perimeter, lake on the north and east side, county road on the south side.

Adjacent fuels: Native mixed prairie and the village of Browington on the west. Private wooded property on the south. Lake on the north and east

PROJECT RESOURCES
Prescribed Fire Burn Boss: Jason Hurley
Crew size: Four + (4)
Ignition/holding crew(s): 2 crews with 2 members on each crew

Suppression crew(s): none		
Other crew members: Mop-up will be done by the same crews after the unit is burned.		
Hand equipment:	Number	Assignment
Drip torches	2	Hurley, Smith
Backpack pumps	2	Cordrey, Abdoler
Swatters	0	
Broom rakes	4	Hurley, Smith, Cordrey, Abdloer
Chainsaws	1	Smith
Backpack blowers	2	Hurley, Smith
Weather kit or Kestral	1	Hurley
Other:		
Mechanized equipment:	Number	Assignment
ATVs	0	
Tractor/Gator	1	Hurley, Smith
Pickup with water unit	1	Hurley
Dozer	0	
ATV water unit	2	Abdoler, Cordrey
Pulled water unit	0	
Other:		
Other equipment:	Number	Assignment
Matches	Each crew member	Hurley
Portable radios	Each crew member	Hurley
Blower fuel	2 gal.	Hurley
Drip torch fuel	15 gal.	Hurley
Bolt cutters	1	Hurley
Pliers	4	Hurley, Smith, Cordrey, Abdoler
Drinking water	3 gal.	Hurley
Food	0	
Compass	1	Hurley
Aerial photos, maps, topos	2	Hurley
First aid kits	1	Hurley
Cell phone	1	Hurley
Other:		

LOGISTICS

Weather monitoring: Forecast day before planned burn. On-site weather just prior to ignition.

Public notifications:

VFDs: Deepwater (660) 696-2722
Henry County Sheriffs Department (660) 885-5587
MDC –Camdenton Forestry Dispatch (573)346-2210 Pat x221
Other adjacent land oweners

Ignition plan (attach map): Ignition will begin at point "A to B" to establish a black line. Crew 1 will fire towards "C" and crew 2 will fire towards "B" meeting in the middle. Upon Completion of field 1 move to field 2 and begin fire at point "B to E" to establish a black line. Crew 1 will run fire from "E to F"

Contingency plans:
Fire out of prescription: After fire is ignited, crews will adjust to weather changes as necessary
Minor escapes (spotovers): Holding crews will handle spot fires.
Moderates escapes: Firing crews will be notified of the escape. Further ignition will cease. Firing crews, as needed, will assist holding crews to extinguish the escaped fire.
Major escape: Ignition will cease. One member from each firing crew will serve as holding crew for the prescribed burn. The remaining burn crew will take action to suppress the escaped fire. Back-up resources will be notified and measures will be taken to contain the fire within the Dept. area.

BURN PLAN REVIEW AND APPROVAL

Low risk assessment (value 8-13) – Operations Manager or Park Manager

Signature: Date:

Moderate risk assessment (value 14-22) – Operations Manager or Park Manager

Signature: Date:

High risk assessment (value 23+) – Operations Manager or Park Manager

Signature: Date:

RE-APPROVAL**

I certify that this burn plan is still valid and the risk criteria (new construction, fuels, etc.) have not changed.

RXBB Signature: Date:

I certify that this burn plan is still valid and the risk criteria (new construction, fuels, etc.) have not changed.

RXBB Signature: Date:

I certify that this burn plan is still valid and the risk criteria (new construction, fuels, etc.) have not changed.

RXBB Signature: Date:

I certify that this burn plan is still valid and the risk criteria (new construction, fuels, etc.) have not changed.

RXBB Signature: Date:

** A burn plan may be used for repeat burns of an area without rewrite if the Prescribed Fire Burn Boss certifies that the plan is still valid and none of the risk assessment criteria (such as new construction or developments, fuel type, smoke impacts, etc.) have changed.

DAY OF BURN CHECKLIST

Area/Field, Stand or Unit No.:

Date:

Burn Day Checklist (Go/No Go):
Refer to contents of Burn Plan

______ Notifications made

______ All equipment present and in working order

______ Personnel on site with proper personal protective equipment

______ Personnel briefed on procedures and contingencies

RISK ASSESSMENT AND REVIEW LEVEL WORKSHEET

Record score for each criterion, total numerical value, refer to chart to determine review level, attach worksheet to burn plan, initiate review process.

Assessment prepared by: Jason Hurley (Name) 11-9-06 (Date)

for: Browington Swithcgrass LU D-15/16 (Area) 160 (Burn Acres)

ASSESSMENT CRITERIA	VALUE 1	2	3	4	Score
FUEL TYPE (Based on BEHAVE fuel models. Select the fuel type with the highest value)	Herbaceous or herbaceous dominated, Models 1-3	Old field or shrub dominated, Models 4-7	Timber litter; branches and leaves, Models 8-10	Slash, Models 11-13	1
SIZE OF BURN AREA* (acres)	≤ 80 ac.	81-160 ac.	161-320 ac.	>320 ac.	2
ESCAPE POTENTIAL	No adjacent fuel	Adjacent fuel with low ignition probability	Adjacent fuel with moderate ignition probability	Adjacent fuel with high ignition probability	3
ADJOINING HAZARDS	No adjoining private land or high value resources	Adjoining private land, but no high value resources	High value developments within 1/4-1/2 mile	High value developments within 1/4 mile	3
TOPOGRAPHY	Topography flat to gently rolling, 0-10% slopes	Topography gentle to moderate, 11-20% slopes	Topography moderate to severe, 21-30% slopes	Topography severe, slopes often >30%	1
POTENTIAL IMPACT OF SMOKE ON TRAFFIC	No impact	1/4-1/2 mile from secondary roads	<1/2 mile from major highway or <1/4 mile from secondary roads	<1/4 mile from major highway	2
IMPACT OF SMOKE ON RESIDENTIAL, INDUSTRIAL OR HIGH PUBLIC USE AREAS*	No impact	Isolated residences. Low public use.	Small rural community or groups of dwellings. Moderate public use	Large residential area or industrial site. High public use.	3
PLANNING	Approved area plan with site specific burn objectives; OR previously approved burn unit; OR private land with approved burn plan**	Area plan approved or in progress. Burning identified as an approved management practice.	Area plan approved or in progress. Burning not mentioned as an approved management practice.	No area plan approved or in progress	1
				Total Assessment Value	15

REQUIRED REVIEW AND APPROVAL

Low Risk: Assessment Value 8-13
Moderate Risk: Assessment Value 14-22
High Risk: Assessment Value >22

BURN PLAN
CLEARWATER LAKE PROJECT

Area/Unit: Clearwater Lake, River Road Right Bank Board Walk

Prepared By: Jason Wilson
Date: 6-7-06

Legal Description: (with map) T28N, R3E, S5 & 6

Acreage: 4 acre

Site Description: Board walk has been pushed into piles and needs to be burned in order for new walk to be built.

Fire Sensitive Areas: none

Smoke Sensitive Areas: River Road Park north of burn site.

Fire Lines: Blown trail, Black River.

Adjacent Fuels: Timber

Burn Objectives: Debris removal site prep.

Prescription:

Preferred Timing- Early morning, June-July
Desired behavior- ring headfire

	Range	Ideal
Temperature	30-95	65-80
Relative Humidity	25-65	40
Wind Direction	variable	South

Project Resources:

Crew Size: 4

Burn Boss: Jason Wilson

Ignition/Holding Crew(s): 2

Suppression Crew(s):

Equipment:

Hand Equipment

Needed(x)		Number
X	drip torch	2
	backpack pump	
	swatters	
X	fire rakes	4
	bow rakes	
	chainsaw	
X	backpack blower	1
	Other (list)	

Mechanized Equipment

Needed(x)		Number

District Forester (if required)

Little Rock District
U. S. Army Corps of Engineers
P. O. Box 867
Little Rock, Arkansas 72203-0867

Regulation
No. 1130-2-32

Project Operations
Project Fire Management

1. Purpose. The purpose of this regulation is to provide guidelines to Little Rock District project managers and employees in fire management operations, including prescribed burning, and preparing and responding to wildfire situations. The regulation is intended to be flexible; therefore, of value to all projects, and to provide the necessary foundation to establish standards for all fire management operations.

2. Applicability. This memorandum is to be implemented at all Corps of Engineers water resource development projects in the Little Rock District.

3. References.

a. ER 1130-2-540, Project Operations, Environmental Stewardship Operations and Maintenance Policies dated 15 November 1996.

b. National Wildfire Coordinating Group. 1993. National Interagency Incident Management System, Wildland Fire Qualification Guide 310-1.

c. National Wildfire Coordinating Group. 2000.Wildfire and Prescribed Fire Qualification System Guide, National Wildfire Coordinating Group, Incident Operations Standards Working Team

4. Public Safety. If a wildfire threat is considered eminent, potential impacts on public safety should immediately be evaluated. It is imperative that no communication be taken for granted in notifying the visiting public related to the danger from fire and keeping resident and project office personnel informed. An immediate communication should be opened between the park ranger or park attendant nearest the fire and resident or project office to insure that there is an appropriate first response and that future decisions related to extinguishing the fire can be based on the most accurate information. Local law enforcement and fire fighting response agencies

---

This regulation suspersedes SWLOM 1130-2-32 dated 4 March 1991.

should be kept informed. Project Managers or their counterparts may authorize evacuations for Public Safety. In the event evacuation is deemed necessary, the evacuation needs to be orderly. Instructions should be simple, clearly stated, and easily understood. Project Offices and Gate Shacks should have emergency phone numbers and a prior action plan established in the event of wildfires. All new employees and gate attendants should be briefed, and action plans should be routinely discussed and re-evaluated during employee safety meetings prior to recreation seasons and/or high fire danger periods, and with gate attendants during pre-work conferences. Burn Bans and posted notices during periods of high fire danger, notifications in local papers, coordination with local governments and other appropriate restrictions are some methods by which projects may control the danger of wildfires in public use area. Periodic fuels reduction prescribed burns during the off season are useful in controlling hazardous fuel levels, but should be accomplished in conjunction with written prescribed burn plans, professional fire crews, and coordinated with appropriate agencies.

5. Local Flexibility. Operations Managers may develop a fully trained and qualified project fire management force at project locations if the program is based on the training and certification requirements established in the Wildland Fire Qualifications Subsystem Guide 310-1, Parts one and two, prepared by the National Wildfire Coordinating Group (NWCG). Compliance with training and certification requirements will be the responsibility of the Operations Manager or his designated evaluator. The project would act as the Home Unit for deployment, if applicable. Projects that would not benefit from this level of operation may elect to develop OMP fire protection plans that depend on local agency agreements solely or in part.

6. Employee Safety. Local initiative may be the most effective in determining how much training is needed, how much is available, from whom, and which employees need it. However, all individuals who will be actively engaged in support of prescribed burning activities must receive, at a minimum, training comparable to the standard fire fighting training: S-110, Basic Fire Suppression; S-130, Basic Fire; and I-100, Incident Command System Orientation. This training is also recommended for individuals who might be first responders to wildfire situations. All Employees confronted with wildfire situations may, of necessity, participate in evacuation, dispatch, or other indirect duties when the situation merits. However, only adequately trained and physically fit personnel, as referenced under employee fitness, are recommended to engage in extinguishing a wildfire situation other than those considered easily extinguishable and unthreatening. Appropriate training may be coordinated through the District Forester, or through the Arkansas-Oklahoma interagency Coordinating Center, (www.fs.fed.us/oonf/fire/index.html).

7. Employee Fitness. Any individual who will be actively engaged in conducting prescribed burning must enroll in the project office medical surveillance program, and receive a doctor's physical and clearance to be able to perform arduous, moderate, or light physical exercise depending on the individual's fitness level. Through proper planning, prescribed fires should not exceed moderate intensity. The individual along with the doctor will be responsible for assessing the individual's abilities with respect to fitness level and individuals generally should

govern the extent and pace of their physical activity. The individual will arrange for appropriate duty through the Operations Manager. Operation's Managers may elect to appoint a project contact person to act in this capacity. Project personnel designated to coordinate Fire Management requirements or evaluate fire training needs should receive advanced fire management training, and have a thorough knowledge of fire management and qualifications established under the 1999 Wildland and Prescribed Fire Qualification System PMS 310-1, established by the National Wildfire Coordinating Group (www.fed.us/fire/310-1/)

8. Equipment, Vehicles, and Personal Protective Equipment. In times of high fire danger, backpack sprayers and flappers should be carried in each ranger and inspection vehicle. Individuals with the proper equipment can extinguish small fires with quick action. Other equipment should be readily available at the resident or project office. In no case should vehicles be parked in an area where there is the possibility that heat, sparks, or fire could damage or cause combustible parts to burn. On projects where the potential for threats from wildfire are considered high, and/or local response may be delayed, adequate first response equipment such as backpack sprayers or small vehicle mounted pumpers are recommended. All equipment and tools should be inventoried, serviced, and readied annually and when local fire danger becomes high. Employees directly involved in fire management activities will use the proper personal protective equipment (PPE) as recommended in the safety manual. However, steel toe shoes will be discretionary to the individual per the recommendations under the National Wildfire Coordinating Group.

9. Fire Fighting Agreements. To accomplish wildland fire management for prescribed burn and fire control, the projects may enter into reciprocal agreements with appropriate public organizations or agencies. Such agreements may provide for re-imbursement of any or all costs incurred in performing wildland fire management actions on Corps lands for prescribed burn and fire management activities. Such agreements should include a waiver from claims for compensation (typically reciprocal) of any loss, damage, personal injury, or death resulting in the performance of the agreement. Operations Managers are encouraged to accomplish wildland fire management through reciprocal agreements and/or appropriately trained and equipped personnel. Fire Management requires close and continuous coordination with other resource management and fire control agencies to ensure mutual understanding of respective levels of responsibility and reciprocity.

10. Fire Reports. Appendix A is a check-off fire reporting form (SWL 423) and Appendix B is a sample Prescribed Burn Plan. SWL Form 423 will provide an informational document when hired labor or local fire departments or districts are called to respond to fires on the project. Appendix 2, the Arkansas Forestry Commission's Prescribed Burn Plan standard form will provide an informational document for developing prescribed burn plans provided project personnel have the appropriate training and authority. These forms are examples to be used and may be modified for individual project use. Completed forms will be maintained at the Resident or Project Office. The district Forester should also be notified of fire management activities to facilitate any public inquiries. When park facilities are damaged by fire, a memorandum will be

drafted detailing the extent of the fire, the estimated amount of damages, and an estimate of the time that the facility will be lost to the public.

4.8 Missouri Department of Conservation Burn Plan

INSTRUCTIONS
MDC BURN PLAN

Following are specific instructions for completing each section of the MDC burn plan:

PROJECT DESCRIPTION

Area/Field, Stand or Unit No.:	Place all designations here as to area, management unit, field or stand number, project designation, landowner, etc. Multiple small fields or stands in close proximity to each other with similar management objectives and fuel types may be lumped together on one burn plan.
Prepared by:	Name of the person who actually completed the burn plan even if completed by Prescribed Fire Planner.
Date:	Date the plan was prepared.
RXBB signature:	Certified Prescribed Fire Burn Boss who has reviewed the plan and area to be burned and accepts responsibility for the plan being complete and accurate.
Date:	Date the plan signed by the Prescribed Fire Burn Boss.
Location:	List the legal description (section, township, range) or latitude and longitude of the burn location. Provide map(s) that illustrate topography, county roads, project boundaries, vegetative cover and ignition plan.
Acreage:	List the acres within the planned burn area boundary.
Site description:	List the plant communities and estimate proportions of each (i.e., 20% prairie, 40% savannah, 40% idled cropfield). List the fuels – type and estimated tonnage using NRCS estimators for forage grasses. For other fuels, estimate amount (light, moderate, heavy). List the terrain slopes and aspects if they are expected to be a factor in the resulting fire behavior or fire effects.
Sensitive areas:	List any areas or ownerships that may be sensitive to a prescribed fire or the smoke. Include areas such as: houses/structures, towns/cities, airports, landowners that need special attention, roads/highways. Also include any areas within the burn unit that will require special attention, i.e., powerlines, wet areas near roads and trails, concentrations of snags or high fuel loads near the boundary. If there are any streams with permanent flow or permanent pools, be sure to note them and secure the Fisheries Regional Supervisor's approval. Burn plans that include Natural Areas must be reviewed by the Natural History Biologist.
Risk Assessment Value:	List the risk assessment value (8-32) from the Risk Assessment and Review Level Worksheet. Attach a copy of the worksheet to the plan.

PRESCRIPTION

Burn objectives:	The stated objectives for the burn need to be clear and quantifiable so the project can be evaluated for success or if planned management needs to be altered. "Burn it to see what happens" isn't quantifiable. Even if you are interested in evaluating the results of "returning fire to its

natural role in the ecosystem," you have a general idea of what the impacts will be. List those impacts quantifiably. For example, amount of litter removed, type or amount of herbaceous vegetation encouraged, species/sizes/percents of woody species removed. Select your desired conditions, write the objectives and then evaluate the burn to see if either your expectations or the management program need to be modified.

Preferred timing:	List the calendar dates and any phenologic (plant development) indicators such as: April 1 desired but within March 15-April 15 period. Prefer dogwood leaves to be size of squirrel's ear, or bluestems with 1-3" of new growth. NOTE: Plant development indicators are optional.
Desired fire behavior:	Fire behavior needed to achieve your objectives: hot or cool, head or backing fire, flame length if known, amount of fuel consumed or percent of area burned.
Conditions needed:	List the range of acceptable temperatures, relative humidities, fuel moistures, mid-flame wind speeds (eye-level winds) and wind directions that will give you the desired fire behavior and then list the "ideal" or best set of conditions, if you could pick them exactly. Fire behavior parameters will be required using BEHAVE PLUS fire behavior modeling software. You can determine the 1- and 10-hour fuel moisture for your burns using the basic guidelines provided during the Level 3 training and then verify them by taking on-site weather before the burn.
BEHAVE run results:	Preparers of the burn plan should model the expected fire behavior for both the headfire and backfire and record the visual estimates of the fire behavior in the post-burn evaluation portion of the plan. BEHAVE PLUS will give you estimated rates of spread, flame length, heat/ft^2 and fireline intensity. Each of these factors influences the effectiveness of the burn and the staff/equipment needs on the fireline. Use these expected parameters to determine how the fire should behave. Also make a BEHAVE PLUS run on any adjacent fuel that may create a problem in case of an escape. This allows you to plan contingencies should an escape occur.
Smoke Management	
Desired atmospheric conditions:	Most burns will be conducted under unstable atmospheric conditions to get maximum lift of the smoke. Unstable atmospheres are typically present on clear to partly cloudy days. Cloudy to overcast days are typically stable conditions and smoke will not rise or dissipate. The plan should contain minimum atmospheric conditions of mixing heights greater than 1650 feet and ventilation rates in excess of 6000 cubic meters per second. These figures are calculated by the weather forecasters and should be available on the twice daily forecasts. These criteria will provide for good smoke rise and mixing with the atmosphere. These are not requirements for all burns, especially if smoke will not be a problem such as in rural areas with few roads or houses or in the deep Ozarks where there are extensive public ownerships and smoke management concerns are negligible.
Air quality:	List any air quality restrictions from DNR air quality standards, city or county ordinances, etc.

Firelines:	List the approximate lengths and types of firebreaks, including natural breaks. Note the timing of firebreak establishment and any follow-up firebreak inspections close to or on the day of the burn.
Adjacent fuels:	List adjacent fuels around the project area and make note of any with a high potential for problems in the event of an escape. BEHAVE PLUS estimates of fire behavior in these fuels, though not mandatory, will provide you expected fire activity should you experience an escape.

PROJECT RESOURCES

Prescribed Fire Burn Boss:	List the certified Prescribed Fire Burn Boss who will conduct the burn. List multiple names if assignment for the burn will be made at a later date.
Crew size:	Total number of able bodies needed and levels of training, if needed for specialized tasks.
Ignition/holding crews:	Number of crews and number on each crew.
Suppression crews:	Number of crews and number on each crew.
Other crew members:	List other needed personnel for media contact, temporary conservation area road closures, weather recording, go-fors, etc.
Equipment:	Using the list, check those standard items needed and the number to be available. Expand the list under each category to list all of the equipment needed on site before you start your burn. Personal safety gear – hard hats, gloves, boots, etc. – need not be listed as these are required by policy and are the responsibility of anyone working on a fire.

LOGISTICS

Weather monitoring:	List the sources of weather information that will be used and the timing of the weather checks (before, during and after the fire).
Notifications:	List the people or agencies to be contacted and their phone or radio numbers. List may include, but need not be limited to, affected MDC regional and other supervisors, Fire Zone Managers, related agencies, news media, rural fire departments, sheriff, 911 Dispatch and adjacent landowners.
Ignition plan:	Provide a brief narrative of the planned ignition strategy and sequence On map(s) attached to the plan indicate: - Project boundary - Firebreaks by type - Placement of personnel and equipment - Firing sequence including wind direction - Hazards either inside or outside the burn area that may cause a problem with conducting the burn - wet spots, fences without gates, fuel jackpots (brushpiles, patches of dense cover), steep slopes, etc.
NOTE:	All items on the map should be identified in the map legend.
Ignition sequence:	Start ignition = X

Crew Movement = arrows
Crew Designations = numbers (1, 2, 3, etc.)
Map Locations = letters (A, B, C, etc.) references for either ignition progress or crew placement, mark these key points on the ground for positive identification by burn crew members

Contingency plans: What you will do in the event of a problem with the burn?

NOTE: Any fire outside the control line is considered an "escape."

NOTE: Escape routes for personnel should be specified in the event of a major escape or whenever going "into the black" is not sufficient. This is especially important on burns where high fuel loads or terrain make entrapment of personnel more hazardous.

Fire out of prescription: Specify what your actions will be if conditions move outside the prescription after the burn has been ignited. Are there points when the fire will be shut down? Will there be a point where the firing will continue, even if conditions become better or worse than the prescription dictates? Any different actions by crews or backups should the conditions move out of prescription in either direction?

Minor escapes: Minor escapes are "spotovers" or small ignitions outside the control line that can be handled by the ignition and holding crews working that portion of the line.

Moderate escapes: Moderate escapes are fires outside the control line that are beyond the control of the crew on that portion of the line, but that can be contained by the prescribed fire crew on the burn.

Major escape: Major escapes are fires outside the control line that tax the limits of the on-site crew and necessitate calling backup forces or require the use of secondary suppression boundaries. The secondary lines should be specified in this section to facilitate crew movement in the event of a major escape.

BURN PLAN REVIEW AND APPROVAL

Burn plans must receive regional supervisor approval by the individuals specified in the Risk Assessment and Review Level Worksheet. Regional Supervisors must be Incident Commander (IC) or Prescribed Fire Burn Boss (RXBB) qualified to sign. If a Regional Supervisor lacks either of these qualifications, they will select a member of their staff who is qualified as an IC or RXBB to sign on their behalf. All private land burns conducted by MDC personnel must follow the review process for Moderate Risk or High Risk burns based upon the total assessment value.

RE-APPROVAL

A burn plan may be used for repeat burns of an area without rewrite if the Prescribed Fire Burn Boss certifies that the plan is still valid and none of the risk assessment criteria (such as new construction or developments on adjoining land, fuel type or conditions, smoke impacts, etc.) have changed. The Prescribed Fire Burn Boss certifies by way of signing and dating the original plan.

DAY OF BURN CHECKLIST

To be checked off and signed by the Prescribed Fire Burn Boss as a final check that everything is in order before initiating the burn. Insert name and phone number of nearest emergency medical service. Burn Plans that are reused from a previous burn shall have a new Day of Burn Checklist attached and completed.

POST-BURN EVALUATION

To be completed on-site by the Prescribed Fire Burn Boss upon completion of the burn. Weather is to be recorded before ignition and after the firing is completed on small burns. Weather should be checked periodically during large landscape burns. Burn Plans that are reused from a previous burn shall have a new Post-Burn evaluation attached and completed.

NOTE: THE BURN PLAN SHOULD HAVE FOUR DOCUMENTS ATTACHED

- Map(s) that illustrate topography, county roads, project boundaries, vegetative cover and ignition plan
- Risk Assessment and Review Level Worksheet
- Day of Burn Checklist
- Post-Burn Evaluation

4.9 Missouri Natural Resources Conservation Service Burn Plan

Part MO413 – Prescribed Burning
Subpart B - Policy

MO413.10 Prescribed Burning.

A. Natural Resources Conservation Service (NRCS) assistance to private landowners in Missouri during the application of prescribed burning is prohibited. Missouri NRCS employees will not be present during prescribed burns on private land.

B. Prescribed burning may be planned by NRCS employees on all land uses to manipulate or manage the vegetation to meet specific resource management objectives. Planning will be in accordance with the National Planning Procedures Handbook, Prescribed Burning (Code 338) practice standard criteria, Section IV, Missouri Field Office Technical Guide, GM 190 – Part 413 Subpart B and this Missouri amendment to national policy.

MO413.11 Training.

A. Missouri NRCS employees who include Prescribed Burning (Code 338) as a practice utilized in the conservation planning process or who anticipate becoming involved with planning Prescribed Burning will be provided with training opportunities necessary to acquire the knowledge and experience required to meet the various levels of Missouri NRCS job approval.

B. It is the employee's responsibility to maintain documentation of training received and a record of experience on form MO A-2, *Request for Prescribed Burning Job Approval.*

C. NRCS employees will only participate in burn training on public lands with a representative of the public land agency on-site. All burn training must be carried out with the supervision of a qualified burn boss from NRCS, Missouri Department of Conservation (MDC), private contractor (e.g. Technical Service Providers) or other approved entity.

D. Under no circumstances shall an NRCS employee, attending training, initiate the burn.

MO413.12 Certification and Authority.

A. The State Conservationist will designate an NRCS employee to be the "State Prescribed Burn Specialist" (SPBS).

B. The SPBS shall have **Prescription (Rx) Burn Planner 2** job approval authority. SPBS duties include: 1) Reviewing requests for job approval authority; 2) Providing consultation to the State Resource Conservationist (SRC) for job approval authorities and other related duties; 3) Coordinating/providing necessary training.

C. Area Conservationists will designate an employee from within their area to be the "Area Prescribed Burn Specialist" (APBS).

D. APBS shall have **Rx Burn Planner 2** job approval authority. APBS duties include: 1) Reviewing area requests for job approval; 2) Maintaining area job approval records; 3) coordinating area job approvals with SPBS; 4) Annually forwarding copies of area summaries of job approvals to State Grassland Conservationist.

E. The following steps outline the process for acquiring NRCS job approval authority for prescribed burning:

(1) The State Resource Conservationist, in consultation with the SPBS, will determine and grant all job approvals and/or changes.

(2) Requests for initial job approval and changes in job approval originate with the employee and are submitted on MO A-2, *"Request for Prescribed Burning Job Approval"* to the APBS.

(3) If the APBS concurs, the original request with a recommended job approval level will be forwarded to the SPBS. If the APBS does not concur, the request is returned to the employee with the reasons for non-concurrence and actions needed before the request is resubmitted.

(4) If the SPBS concurs, the original request will be forwarded to the SRC for approval. After approval, the SPBS will record the information and return the original MO A-2 to the APBS. The APBS will make copies from the original for the files and return the original form to the employee. APBS will record summaries of job approvals on the Burn Job Approval excel spreadsheet and forward the spreadsheet to the State Grassland Conservationist each October. If the SPBS or SRC does not concur, the request will be returned to the APBS with the reason for non-concurrence and actions needed before the request is resubmitted.

(5) After completion of this training approval, employees will maintain a record of prescribed burning activity for each fiscal year on form MO A-2, "Record of Activity" section. The APBS will review this record and at least one burn plan with the employee once every three years.

(6) A request for change in level of job approval will be made by submitting a copy of the original request form with the accumulated record of activity, following steps 1-4 described above.

F. NRCS will have three job approval levels for employees developing conservation plans and/or practice specifications that incorporate Prescribed Burning (Code 338).

(1) **Awareness:** This job approval authorizes an employee to include prescribed burning as a practice utilized in the conservation planning process. This level of job approval is required for any employee who discusses prescribed burning as an alternative with a landowner or incorporates prescribed burning as a practice in the conservation plan, regardless of whether they write the actual burn plan. Awareness approval does **not** authorize employees to write prescribed burn plan prescriptions except when they are

actively pursuing **Rx Burn Planner 1** job approval authority.

a. To qualify for **Awareness** approval, an employee must attain 16 hours of awareness training by attending the approved MO-NRCS Prescribed Burn Awareness classroom instruction (or SRC approved equivalent) and participating in the application of one prescribed burn while under the supervision of a qualified burn boss from NRCS, MDC, private contractor (e.g. Technical Service Providers) or other approved entities.

b. Once an employee receives **Awareness** job approval, there will be no further requirements to maintain this level of job approval.

(2) **Rx Burn Planner 1:** This job approval authorizes an employee to prepare prescribed burning plans on private land with <60 acres in one firing sequence (plan can cover more than 60 acres), a slope restriction of <12% (average slope) and fuels that include:

- all herbaceous species
- non-volatile woody species
- a limited number (<25% coverage) of live volatile woody species* less than 4 feet tall that will not contribute to a significant change in fire intensity or behavior
- dead woody fuel that will not contribute to a significant change in fire intensity or behavior

**Live volatile woody species are those that have a chemical make-up that causes them to be somewhat "explosive," especially during certain seasons. Examples include eastern red cedar, shortleaf pine, blackberry vines, serecia lespedeza, honeysuckle, and sumac.*

All plans must be checked for completeness by an individual with **Rx Burn Planner 2** job approval. For training purposes only, an employee can, under the supervision of a qualified burn boss from NRCS, MDC, private contractor (e.g. Technical Service Providers) or other approved entity, actively participate in the application of prescribed burning plans on public lands.

a. To qualify for **Rx Burn Planner 1** job approval, an employee must complete the requirements outlined below within 3 years of satisfactorily completing the MDC Level 2 classroom instruction and the NRCS supplement to this course:

- Develop three prescribed burning plans. Plans will be reviewed by a person with **Rx Burn Planner 2** Job Approval Authority.
- Serve as a crew member during the application of two prescribed burning plans on public lands under the supervision of a qualified burn boss from NRCS, MDC, private contractor (e.g. Technical Service Providers) or other approved entity.
- Assist with two post-burn evaluations.
- Assist in one (60-90 day) follow-up evaluation.

b. To maintain **Rx Burn Planner 1** approval, an employee must prepare one prescribed burn plan within 3 years and serve as a crew member during the application of one prescribed burning plan on public lands under the supervision of a qualified burn boss from NRCS, MDC, private contractor (e.g. Technical Service Providers) or other approved entity or demonstrate good prescribed burning judgment, knowledge, and skill, be recommended by the APBS and SPBS, and be approved by the SRC.

c. All employees with **Rx Burn Planner 1** job approval will have each burn plan reviewed for completeness by an **Rx Burn Planner 2** level employee.

(3) **Rx Burn Planner 2:** This job approval authorizes an employee to prepare prescribed burning plans on private land with no slope restrictions that are <320 acres in one firing sequence (plan can cover more than 320 acres) with fuels that include:

- all herbaceous species
- non-volatile woody species
- live volatile woody species* less than 4 feet tall
- a limited number (<25% coverage) of live volatile woody species* greater than 4 feet tall that will not contribute to a significant change in fire intensity or behavior
- dead woody fuel that will not contribute to a significant change in fire intensity or behavior

Rx Burn Planner 2 job approval also authorizes an employee to check burn plans prepared by employees with **Rx Burn Planner 1** approval and serve as burn boss in the application of prescribed burning plans within his/her job approval authority on land owned or operated by NRCS (e.g., Plant Material Center).

*NRCS employees are not authorized to write, implement, review, or approve prescribed burn plans that exceed **Rx Burn Planner 2** criteria.*

a. To qualify for **Rx Burn Planner 2** approval, an employee with **Rx Burn Planner 1** approval must satisfactorily complete the MDC Level 3 classroom instruction and develop five or more prescribed burn plans, two of which must meet **Rx Burn Planner 2** criteria. All plans must be reviewed by an employee with **Rx Burn Planner 2** job approval.

b. To maintain **Rx Burn Planner 2** approval, an employee must prepare and/or review three prescribed burn plans within 3 years and serve as a crew member during the application of one prescribed burning plan on public lands under the supervision of a qualified burn boss from NRCS, MDC, private contractor (e.g. Technical Service Providers) or other approved entity or demonstrate good prescribed burning judgment, knowledge, and skill, be recommended by the APBS and SPBS, and be approved by the SRC.

G. The SRC, in consultation with the SPBS, may grant job approval authority to employees who have previous education and experience.

H. Employees who are actively involved in planning prescribed burns are encouraged to pursue other continuing education courses to expand their knowledge and skills (e.g., National Wildfire Coordination Group courses).

I. Refer to Table 1, *"Missouri Job Approval Authority for Prescribed Burning"*, for a summary of job approval level criteria/policies.

J. If an employee fails to follow established NRCS policies, procedures and practice criteria for Prescribed Burning (Code 338), his/her job approval will be revoked.

MO413.13 Planning Prescribed Burns.

A. Only trained employees with appropriate job approval will provide planning assistance on prescribed burning. A detailed plan for the proposed burn area will be prepared using Job Sheet Agron-18. All prescribed burn plans will contain the following statement:

"On-site assistance by NRCS personnel to accomplish burning operations on private land is not authorized. NRCS staff, cooperating organizations or cooperating state agencies are not authorized to provide assistance to carryout any portion of this plan as an official NRCS representative."

B. Landowners should be encouraged to attend the standardized MDC/NRCS Landowner Prescribed Burn Workshop prior to receiving the prescribed burn plan. Either the landowner or a representative with legal Power of Attorney must sign the burn plan following review with an NRCS employee. A signed copy of the prescribed burn plan must be retained in the landowner's field office case file.

MO413.14 Technical Planning and Application Assistance.

A. NRCS employees are only permitted to participate in the application of prescribed burns on public land as required for training and job approval authorization. All participation in training burns must have prior approval by the employee's supervisor.

B. Any onsite assistance by NRCS personnel to private landowners during the application of prescribed burning is prohibited. Follow-up assistance with landowners and operators to evaluate the effects of their burning operations is permitted.

C. Employees are authorized to participate on prescribed burns on lands owned or operated by NRCS (e.g., Plant Material Center) for the purpose of maintaining or applying treatments. All such burns will be carried out with supervision of a qualified burn boss from NRCS, MDC, private contractor (e.g. Technical Service Providers) or other approved entity.

MO413.15 Safety.

A. All employees attending training will wear appropriate personal protective equipment (PPE) when participating in a prescribed burn activity. Mandatory PPE includes:

Provided by the employee:

- Long sleeved shirts and pants made of 100% cotton or wool or NOMEX material. Shirts should be of sufficient length to allow overlap of gloves and shall be worn with sleeves down and fastened and shirt tails tucked into pants. Pants shall not have cuffs or frayed bottoms and must extend to cover boot tops. Hats, coats, and coveralls must meet these fabric requirements.
- Leather boots (preferably lace-up with a heavy, lug sole)
- Leather gloves

Provided by NRCS:

- Eye protection including safety glasses or goggles
- Hardhat on any burn that includes forest or woodland in the burn area or burns that include live volatile woody species greater than 4 feet tall.
- Hearing protection if the employee is operating motorized equipment (i.e. blower or chainsaw)

B. Smoke management will be considered during prescribed burn planning activities. The following criteria apply to all activities regardless of job approval level:

- NRCS prescribed burn planning assistance is not allowed on fields that are within 1/8 mile of a road with an Average Annual Daily Traffic (AADT) of 1200 as estimated by the Missouri Department of Transportation. Reference the following website for statewide information:
  `http://www.modot.org/safety/trafficvolumemaps.htm`
- Special consideration must be given to sites that are located in airsheds of concentrated residences or areas with moderate public use or visibility.
- All plans shall be written so that the planned wind direction takes smoke away from roads, residences, or other sensitive areas.
- No planning shall occur within one mile of an airport unless the landowner acquires written approval from that airport authority.

MO413.12 Certification and Authority

Table 1. MISSOURI JOB APPROVAL AUTHORITY FOR PRESCRIBED BURNING

Factor / Class	Awareness	Rx Burn Planner 1	Rx Burn Planner 2 (3/)
Duties/Activities	Include practice Prescribed Burning (Code 338) in Conservation Planning Process	Prepare burn plans with restrictions on size, vegetation, and slope. All plans must be submitted to an Rx Burn Planner 2 for approval	Prepare burn plans with restrictions on size and vegetation. Review plans written by Rx Burn Planner 1 staff. Serve as Burn Boss on prescribed burns on land owned or operated by NRCS (PMCs).
Required Classroom Training	NRCS Awareness Training (or SRC approved equivalent)	MDC Level 2 NRCS Supplement	MDC Level 2 NRCS Supplement MDC Level 3
Qualifications to Obtain	Following classroom instruction, participate on 1 prescribed burn on public land	Following classroom instruction, prepare 3 burn plans and participate on 2 prescribed burns on public land and post-burn evaluations	Following classroom instruction, prepare 5 or more burn plans of which 2 meet Rx Burn Planner 2 criteria
Acres 1/	NA	60	320
Vegetation 2/	NA	Non volatile herbaceous and woody species with < 25% volatile woody species < 4' tall that will not cause a change in fire behavior	Non volatile herbaceous and woody species with <25% volatile woody species > 4' tall that will not cause a change in fire behavior
Terrain	NA	< 12% (average slope)	No slope restrictions
Smoke Management 4/	NA	> 1/8 mile from state highway with an AADT of 1200; > 1 mile from airport	>1/8 mile from state highway with an AADT of 1200; >1 mile from airport
Currency/Maintenance	None	Write 1 burn plan and participate on 1 burn (public land) per 3 years	Write or review 3 burn plans and participate on 1 burn (public land) per 3 years

1/ Acres: Contiguous acres to be burned on a single management unit on one day during the same growing season are considered to be one prescribed burn. Total acres for any prescribed burn cannot exceed the Acres limits for the appropriate job classification.

2/ Volatile species for Missouri are those that have a chemical make-up that causes them to be somewhat "explosive" especially during certain seasons. They include, but are not limited to, eastern red cedar, shortleaf pine, blackberry vines, serecia lespedeza, honeysuckle, and sumac.

3/ NRCS assistance on prescribed burn sites that exceed Rx Burn Planner 2 criteria is limited to conservation planning only.

4/ Special consideration must be given to sites that are located in airsheds with concentrated residences or areas with moderate public use or visibility;

Prescribed Burn Plan

"On-site assistance by NRCS personnel to accomplish burning operations on private land is not authorized. NRCS staff, cooperating organizations or cooperating state agencies are not authorized to provide assistance to carryout any portion of this plan as an official NRCS representative."

andowner/Operator: ______ County: ______

Address: ______

Phone: ______ Acres to Burn: ______ Planned Timing of Burn: ______

arm and Tract # : ______ CRP Sign-up Number: ______

Field(s): ______ T: ______ R: ______ Section: ______

A. Description of Burn Area:

1. Land Use: ______

2. Present Plant Cover:

a. Woody Plants

Species:	Height (ft.)	Basal Diameter (in.)	% Canopy

b. Herbaceous Plants

Species:	Height (ft.)	Tons / Acre
Cool Season Grasses		
Warm Season Grasses		
Forbs / Broadleaf:		

3. Topography:

	a.Slope %		b. Aspect
field no.			
field no.			
field no.			
field no.			
field no.			

B. Objective and Growth Stage for Burn:

Stimulate Warm Season Grass (WSG) (1-3" new growth)
Control Woody Plants (full leaf)
Stimulate Cool Season Grass (CSG) (1-3" new growth)
Distribute Grazing (1-3 " new growth)
Reduce Wildfire Hazard
Stimulate Forbs
Reduce CSG Growth (1-3" new growth WSG)
Remove litter / Create Bare Ground

Additional / Detailed Objective(s):

C. Acceptable Conditions for Prescribed Burns:

	20 ft. (above ground) Wind Speed in Miles per Hour *						
Humidity	4	6	8	10	12	14	16
25-34%	C-S	C-S	C-S	C			
35-39%	C-S	C-S	C-S	C-S	C		
40-44%	C-S	C-S	C-S	C-S	C-S	C	
45-59%	C-S	C-S	C-S	C-S	C-S	C-S	C
60-69%	S	C-S	C-S	C-S	C-S	C-S	C-S
70-79%		S	C-S	C-S	C-S	C-S	C-S
80-89%			S	C-S	C-S	C-S	C

* Most weather forecasts give wind speeds measured at 20 feet above ground. Eye level wind speed is approximately 1/2 of the 20 ft. wind speed

C = 60-90% cloud cover **or** <u>Before</u> 10:00 AM or <u>After</u> 3:00 PM
S = 0-59% cloud cover **or** from 10:00 AM till 3:00 PM

Specific or Ideal Weather Conditions:

1. Comments:

Starting time of the burn will generally be before 10:00 AM or After 3:00 PM when humidity, temperature and and wind speed / direction are favorable for safe burning. Between 10:00 AM and 3:00 PM temperature and wind speeds are at their daily highest and humidity at its lowest. Be more cautious of starting a burn during this time frame. Review the table above for humidity, cloud cover, and wind speed guidance.

****** The best wind direction for burning is:**
****** <u>Plan map</u> firing sequence wind direction:**
****** Alternative wind direction(s) [firing sequence must be altered]:**

2. Ignition Plan and Firing Sequence: (See the plan map)

The Ring-Head Fire method will be used. Two burn crews will start at the downwind corner / side of the field and travel in opposite directions to "ring" the field, meeting in the upwind corner / side of the field.

*** Parties igniting a prescribed burn may be liable for damages resulting from the fire and smoke, and control costs, should the fire escape the designated area.**

Additional Instructions:

D. **Preparation of Area for Burning:**

1. Firebreak Construction:

a. Firebreak width will be two times the height of the adjacent vegetation

b. Plowed, disked, and burned firebreaks, being essentially devoid of fuel, provide the least danger of fire escape.

c. Close mowed and cool season grass firebreaks have fuel available that can provide an avenue for fire escape. Smoke from green growth reduces visibility inhibiting burn monitoring

d. High mowed fire intensity reduction lines (8-12" stubble) will be installed if fine fuel exceeds 1.5 tons / acre. Line width will be at least 10 feet at 1.5 - 3 tons / acre and 20 feet at > 3 tons / acre.

e. Kind of Firebreak:

Kind of Firebreak		Width
Disked / Plowed:		
Close Mowed:		
Cool Season Grass:		
High Mowed Intensity Reduction:		
Other Firebreaks i.e.		
raked, black lines:		

*** See plan map for location and extent of firebreaks**

*** Firebreaks should be installed as far in advance (6 months) of anticipated burning period as possible**

f. Existing Firebreaks: (describe here and show location and extent on the plan map)

g. Potential Hazards Present within the Burn Area:

(describe here and show location and extent on the plan map)

. Adjacent Areas: (outside of burn area)

1. Special Precaution Areas: (describe here and show location on the plan map)

2. Backup or Secondary Firebreaks: (describe here and show locations on the plan map)

F. Equipment / Personnel Needs:

1. Safety Equipment:

- ☑ Clothing - natural fiber (cotton, wool)
- ☑ Boots - leather
- ☑ Gloves - leather, cotton, wool
- ☑ Bandanas / Face Mask
- ☑ Goggles
- ☑ First Aid Kit
- ☑ Drinking Water

2. Tools / [redacted] check equipment required and state numbers of tool needed)

[redacted]00-300 gallon backup water supply with pump, 100 ft. of hose and hand wand
[redacted]TV w/ Sprayer (hose and hand wand)
[redacted]rip Torch(es)
[redacted]ackpack Sprayer(s)
[redacted]lapper(s)
[redacted]lower(s)

☐ Cell Phone
☐ Radios
☐ Broom Rake(s)
☐ Wire Cutters
☐ Chain Saw

3. Personnel Needed:

☐ total no. of people needed
Designated Fireboss: ☐ (name of person)
☐ Ignition crew (no. of people using a drip torch)
☐ Holding crew (no. of people using flapper, rake, backpack, ATV w/ Sprayer containing the fire in the designated area)
☐ Mop-Up Crew (no. of people following the holding crew checking for escapes, using flappers, rakes, backpack, ATV w/ sprayer)
☐ Traffic Control Spotters (no.)

* Using the Ring-Head Fire Method of Ignition typically two crews with 2 to three people each are used. One person lights the fire with the drip torch, with one crew member serving as the holding crew putting out fire along the firebreak if needed, trailed by another person serving as the mop-up crew, watching for escapes

**** Anyone with heart, respiratory, or mobility impairments will not participate in the burn.**

G. Special Considerations:

1. Precautions to Prevent Fire Escape:

- ☑ Check Firebreaks
- ☑ Check tools and Equipment
- ☑ Check and monitor weather conditions
- ☑ Review the burn plan with all crew members
- ☑ Review with crew members plan to handle an escape, who does what and goes where
- ☑ Check fire behavior with a test fire in down wind corner / side of burn area
- ☑ Allow back and flank fires to burn 50 ft. into the burn area before lighting the head fire

2. Suppression Plan if Fire Escapes:

- ☑ Cease Ignition
- ☑ Leave sufficient personnel with the prescribed burn to prevent further escape
- ☑ Remainder of personnel move to suppress the escape
- ☑ One person will be designated to bring the backup water supply
- ☑ One person will call the fire department

3. Patrol and Mop-Up:

- ☑ The burn crews will remain on-site until all fires are extinguished
- ☑ Patrol the firebreaks before leaving the site
- ☑ Check wooded areas for spot-overs

H. Prescribed Burn Plan Map:

- ☐ See Attached Sketch
- ☐ See Attached Aerial Photocopy

1. Plan Map Requirements:

- ☑ North Arrow
- ☑ Planned Wind Direction
- ☑ Firing Crew Designations
- ☑ Firing Direction
- ☑ Firing Sequence
- ☑ Location of Backup Water Supply
- ☑ Firebreaks:
  - ☐ Existing Firebreaks
  - ☐ Hand lines (raked, blower)
  - ☐ Burned Firebreak (black lines)
  - ☐ Cool Season Grass
  - ☐ Plowed / Disked
  - ☐ Close Mowed
  - ☐ High Mowed Intensity Reduction
  - ☐ Secondary / Backup Firebreaks
- ☑ Land uses (fuel types) Surrounding Burn Area
- ☑ Special Precaution Area(s) {inside and outside burn area}
- ☑ Other Items: (optional)
  - ☐ Ingress / Egress (escape) Route(s)
  - ☐ Gate Location(s)
  - ☐ Fences

National Park Service	**573-323-4236**
US Forest Service- Winona District	**573-325-4233**

4. **NEIGHBOR NOTIFICATIONS:**

Preserve neighbors, including numerous absentee landowners, will be notified in writing at least one week prior to burning. All neighbors living within a mile of the fire units will be contacted the morning of the burn. See attached list of names and addresses.

5. UNIT DESCRIPTION:

Vegetation Types	Fuel Models	% of Unit Area	% Slope	Aspect
Leaf litter woods	8	13	0-10	45-180°
Savanna-Woods-uplands	9	85	0-50*	0-360°
Glade-Savanna	2	2	5-20	120-280°

*Slope percent greater than 35 is a very small percentage of the unit.

Fire Unit Narrative Description:

The site consists of dry and dry-mesic oak and oak-pine woodlands on the highly dissected river hills adjacent to the Current River with grassy and rocky dolomite glades scattered over some of the south and west facing slopes. Glade vegetation is dominated by Little Bluestem (Andropogon scoparius) and frequent expanses of exposed bedrock. Upland woods in the unit are degraded savanna and open woodland with sparse fine grassy fuels and leaf litter. South facing steep slopes are covered with open cherty oak and pine woods, often with discontinuous fuels. North and east facing uplands are closed forest with thicker leaf litter accumulations. Upland waterways have more sparse leaf litter and an abundance of grasses and sedges that are often green through the winter.

6. PRESCRIBED BURN JUSTIFICATION:

Type of Burn (ecological management, hazard reduction, training, or research):

Ecological Management

Burn Unit Management Goal(s):

Implementation of a physical process (fire) known to be pervasive during the genesis and perpetuation of these woodland systems. TNC fire management goals are congruent with MDC and NPS management and strategies.

Specific Burn Objectives:

Increase vigor and abundance of conservative native species; Increase fine fuel species; Reduce leaf litter accumulations; Reduce oak sapling densities and increase light penetration to groundcover layer; Stimulate Shortleaf Pine reproduction.

7. FUEL AND WEATHER PRESCRIPTION

Guidance Parameters:

Wind Direction(s)	**225°-45° (excludes 45°-225°)**
Air Temperature (°F)	**30-75**
Relative Humidity (%)	**25-70**
20 ft wind speed (mph)	**3-15**
Days since rain	**<7 (some moisture present in soil)**

Required Parameters:	MAX	MIN	PREFERRED (if applicable)
Wind Direction(s)			any
Effective Windspeed (mph)	6.5	2.5	
1-Hour Fuel Moisture (%)	4.6	14	
10-Hour Fuel Moisture (%)	5.6	15	
100-Hour Fuel Moisture (%)	6.6	16	
Live Fuel Moisture (%)			>30%
Atmospheric Mixing Height (ft)			>500 m.

8. PREDICTED FIRE BEHAVIOR

	Fuel Model		
	#9	#8	#2
Max. Headfire Flame Length (ft)	3.9	1.5	9.3
Min. Headfire Flame Length (ft)	1.6	0.6	3.8
Max. HF Rate of Spread (ch/hr)	15	3	76
Min. HF Rate of Spread (ch/hr)	3	1	12
Max. Backfire Flame Length (ft)	0.9	0.3	2.1
Min. Backfire Flame Length (ft)	0.6	0.2	1.4
Max BF Rate of Spread (ch/hr)	1	0	3
Min. BF Rate of Spread (ch/hr)	0	0	1
Max. Scorch Height			

9. FIRE BEHAVIOR NARRATIVE:

Fire coverage should be at least 60% with fire behavior of low to moderate intensity. Interior ignition along the bases of slopes may be needed to ensure rapid burn out and achieve moderate intensity fire behavior.

10. SMOKE MANAGEMENT PLAN

Smoke screening procedures completed? Yes / No

List downwind/downdrainage smoke sensitive areas:
List other smoke sensitive areas:
- Highway D and residences east approximately 4-5 miles.
- Current River Logyard Access and Hwy HH 2 miles northwest of unit.
- Hwy M and residences 1.5 miles southeast of unit.

Map of smoke sensitive areas attached? Yes / No

Describe desirable smoke behavior and smoke management actions:
No critical smoke sensitive areas exist for this burn unit. However, because of the size of the unit, surface fire should be nearly complete at sunset if transport winds are predicted to fall below 9 mph after sunset. If evening winds are from the north or west and low mixing heights occur, smoke will be monitored on M and D highways. If smoke accumulates in these areas, stumps and snags producing heavy smoke should be extinguished. Communications with other natural resource management agencies prior to burning will ensure that multiple large unit burns within the smoke screening area will not be attempted during marginal smoke dispersion conditions. Holding crews on the down wind side of the unit will be occasionally rotated with other holding crews if necessary to minimize extended continuous exposure to thick smoke.

11. CREW ORGANIZATION

Qualified fire leader(s):
One TNC approved fire leader.

Crew Number:
One 7 person TNC crew meeting TNC fitness, training, and experience requirements, augmented by two volunteer spotters, all equipped with required safety clothing and equipment: Nomex coveralls, hard hats, goggles, and leather gloves and boots.

Organization chart attached? Yes / No

12. EQUIPMENT

Required items:	**Available**
Pumper on site	Yes / No
Six radios	Yes / No
Protective clothing	Yes / No
Two first aid kits	Yes / No
Two weather kits	Yes / No
Fire shelters*	Yes / No

* Fire Shelters are available, but not required to be carried by all crew members as per Fire Manager's memo of Justification. Crew are required to carry matches at all times.

Equipment Item	Number	Source
Water Pack	6	TNC
Fire Rakes	6	TNC
Blowers	2	TNC
Drip Torch (plus extra fuel)	4	TNC
Mop-Up Tool set	4	TNC
Water Jug (5 gal.)	5	TNC
ATV	2	TNC

13. BURN DURATION

Note: This burn includes nighttime burning hours.

Time (indicate minutes or hours) for:

Baseline Preparation:	4 hours
Spreading Fire:	2hours
Interior fire burnout:	3hour
Mop-up:	3+ Hours
Total Duration:	**12+ Hours**

14. MANAGING THE BURN:

Firebreak preparations:

Firelines will use existing ridge roads from point O north to AA and west to AK. Hand line will be constructed from AK south to AM. Existing road again used from AM to AN. Hand lines will be constructed along the south from AN to O. Roads will be blown free of litter and raked free of continuous grassy fuels. Hand lines will be cut free of brush and raked or blown free of litter 4'-5' wide. Hand lines from AK to bottom of the south slope below AL, the line will be constructed 8'-10' wide. Dead standing trees, snags, within 30' of firelines will be raked around to prevent spotting hazards. Large piles of heavy wood within 30' of the line from point AA counterclockwise to O will be cut and dispersed. Within 50', east and west of line from point AK to AO, all standing dead trees and or snags are to be felled. All map reference points will be clearly marked at the appropriate on the ground locations.

Firing techniques and ignition pattern:

Ideally, the perimeter of the unit will be ignited using two ignition crews, starting at a common point on the south, north, or east ridgetop, and proceeding in opposite directions around the perimeter. After a safe burn in has been achieved around the west and southeast ridgetop perimeter, perimeter ignition will ignite along the steep slopes of the south line, AN-AQ. Ignition crews on the upwind side of the unit will proceed more slowly than the other crews, communicating with the burn boss to prevent fire from overlapping other perimeter lines. Perimeter ignition may be hastened by firing

crews using two torches, firing interior of the perimeter at the same time the perimeter is ignited. Interior ignition will be necessary along the interior creek to speed up burnout.

Crew communication:

Via two-way hand held radios. A mobile phone will be available in pumper truck on site.

Note: Radio communication is not always possible due to size and topographic variation of unit. Crews should be aware of possible problems and be prepared to relay messages.

Fire behavior and weather monitoring:

A fire weather forecast will be obtained from the National Weather Service on the morning of the burn. A forecast for burn day weather, evening and nighttime weather and smoke dispersion and second day extended weather will be obtained. On-site weather will be measured within one hour of ignition, and during and after the burn as needed.

Holding:

Holding will be accomplished with crew members using water pack, and fire rake or flapper as appropriate, following igniters

Fire sensitive areas:

Hunting cabin ca. 0.5 mile north of point AK. Fuels between the cabin and fire unit are woodland fuels.

MDC MOFEP site 9 borders along the west boundary of the fire unit.

Contingencies:

Minor spots will be immediately extinguished by line crews. In the event of an escape, 4 crew members will be designated to contain and patrol the burn unit fire. All other crew will engage in direct or indirect suppression efforts as directed by the burn boss. Any escape threatening adjacent property will require the immediate contact of MDC Forestry suppression crews to help contain the escape.

Potential hazards to crew:

-Steep slopes and large topographic relief has the potential to create up drafts of wind that could result in locally severe fire behavior such as fire whirls and candling of cedar or shortleaf pine.

- South wind direction in this hollow is highly modified by the topography, and winds can potentially funnel in the side hollows that is significantly different than prevailing winds.

- Numerous snags along the perimeter may ignite and pose spotting threats. The prevalence of this tree type and its ecological importance makes complete removal prior to ignition untenable. Any near the perimeter will be raked or blown around.

- Rugged terrain and large unit size will potentially confound suppression of any escapes due to disorientation. All crew persons will have unit maps and compass and be familiar with the unit. Fire lines will be marked onsite with reference points that correspond with maps.

-Fuel loading outside of unit and adjacent to TNC ownership is greater than within the fire unit. Suppression crews should be prepared for more intense fire behavior if spotting occurs outside of the fire unit.

Mop-up:

Perimeter threats will be mopped up immediately following the burn. At least two crew members will remain on site until all surface fire is extinguished. Periodic checks of the unit will be done by crew or designates for at least two days following the burn to ensure that all fire is extinguished.

Public relations:

MDC Forestry will be contacted 24 hours prior to bum day and coordination will be made on the location of the MDC dozer for contingency planning.

MDC, NPS, and USFS offices will be notified the day of the burn.

Follow-up assignments:

Post-burn data will be collected and fire assessment and summary report will be prepared by the bum boss.

15. DOCUMENTATION

Does the site have a Site Conservation Plan?	Yes / <u>No</u>
Review of Laws and Regulations complete?	<u>Yes</u> / No
Site Fire Management Plan complete?	Yes / <u>No</u>
Site Wildfire Response Plan complete?	Yes / <u>No</u>
Site/ element Monitoring Plan complete?	<u>Yes</u> / No

Exemptions or modifications of TNC burn requirements and guidelines:
Fire management and site wildfire planning included in Site Conservation Plan, in progress.

16. LEGAL CONSIDERATIONS

Describe the ownership/management responsibility of this site:

TNC owned and managed preserve.

Releases/waivers required? Yes / <u>No</u>
Releases/waivers attached? Yes / <u>No</u>

PRE-BURN CHECKLIST AND CREW BRIEFING

Preserve: **Fire Unit:** **Date:**

A. PRIOR TO CREW BRIEFING

- ☐ Fire Unit is as described in plan.
- ☐ Required firebreaks complete.
- ☐ Permits obtained. Give permit #'s:
- ☐ Official and neighbor notifications complete.
- ☐ Required equipment is on-site and functioning.
- ☐ Planned ignition and containment methods are appropriate.
- ☐ List of emergency phone numbers are in each vehicle.
- ☐ Planned contingencies and mop-up are appropriate.

B CREW BRIEFING

- ☐ Each crew member has a burn unit map.
- ☐ Fire Unit size and boundaries discussed.
- ☐ Fire Unit hazards discussed.
- ☐ Purpose of burn.
- ☐ Anticipated fire and smoke behavior.
- ☐ Review of equipment and troubleshooting.
- ☐ Check crew qualifications.
- ☐ Review organization of crew and assignments.
- ☐ Review methods of ignition, holding, mop-up, communications.
- ☐ Review contact with the public; traffic concerns.
- ☐ Location of vehicles, keys, and nearest phone.
- ☐ Location of back-up equipment, supplies, and water.
- ☐ Review all contingencies including escape routes.
- ☐ Review mop-up procedures.
- ☐ Answer questions from crew.
- ☐ Give crew members the opportunity to decline participation.

C. PRIOR TO IGNITION

- ☐ Weather and fuel conditions are within prescriptions.
- ☐ Weather forecast, obtained within two hours of ignition, says prescribed weather will hold for two hours past expected duration of burn.
- ☐ Crew members have required protective clothing.
- ☐ Crew members have matches.
- ☐ Conduct test burn.

D. BEFORE LEAVING BURN UNIT

- ☐ Mop-up completed as described in prescription.
- ☐ Next morning inspection arranged.
- ☐ Notifications of completed burn (if required).

E. NOTE ANY MODIFICATIONS TO RX

Fire Leader: **Date:**

4.11 Missouri Division of State Parks Burn Plans

Policy: N03 BURN PROCEDURES	Section: N. NATURAL RESOURCE MANAGEMENT		
	Issued: Original	Revised: 08/21/98	Page: 1 of 3

By policy, the Division of State Parks supports using fire to manage park resources. Fire is an option for many operations' tasks, and essential for many aspects of natural resource management.

Fire can also cause serious damage to property and it can cause personal injury. There are safety and health issues related to smoke dispersal and highway traffic, and fire frequently creates public relations issues. Misusing or accidentally losing control of fire can have serious impacts on our ability to use it again in the future. These impacts may extend to other agencies as well.

Therefore, while the Division intends that fire be a very accessible tool for its staff to use, it also requires adherence to a specific organization and planning process. This policy summarizes those items, with reference to a Burn Procedures Manual for specific details.

DEFINITIONS:

Open Burns: All purposefully ignited, non-contained fires in state parks.

Ecological Burns: Fires intended to accomplish goals of a facility's Natural Resource Management Plan, Ecological Stewardship Plan (Policy 402), scientific research project, or that will impact more than five acres of natural vegetation on undeveloped land.

Operational Burns: Fires planned for facility management, other than natural resource management, that impact no more than five acres of undeveloped, naturally-vegetated land.

Non-regulated Burns: Fires that are exempt from the normal burn planning process. For operational burns this is limited to brush, leaf, and debris piles, and leaf-filled ditches. For ecological burns this is limited to slash or debris piles, and black lining preparatory to conducting prescribed burns. Burning trash is prohibited.

Regulated Burns: Operational fires that require burn plan and qualified Incident Commanders to lead them. Includes all burns not specifically listed as Non-Regulated.

High-risk Fires: Fires conducted in highly flammable weather conditions or fuels, or that have especially sensitive features that may be affected by an escape. Specific rating criteria are provided in the Burn Procedures Manual.

FIRE PROGRAM ORGANIZATION:

Administration

Division Director: Approves Ecological Stewardship Plans.
Chief, Natural Resource Management Section: Approves ecological burn requests, advises on Operational Burn requests that effect native vegetation or use of off-site incident commanders, designates a fire program coordinator, and sets annual priorities for ecological burns.
Director, Operations and Resource Management Program: Approves ecological burns when burn bans are issued.
District Supervisor: Approves operational and open burn requests; ensures compliance with local and state air and traffic safety regulations/ordinances.

Program Coordination, Certification and Scheduling

Fire Program Coordinator: Responsible for overall management of the Division's fire program. Approve all burn plans for ecological and regulated operational burns, organizes an annual burn schedule by priority, and approves go/no-go burn decisions for high-risk fires. This person also maintains certification lists, keeps the Burn Procedures Manual current, and assists with burn plan development.

Burn Implementation

Burn Coordinator:	For a specific fire, writes the burn plan, organizes personnel and equipment, assures that fire lines are prepared, and writes the burn report.
Incident Commander:	For a specific fire, makes most go/no-go burn decisions, and supervises all aspects of individual burn operations.
Facility Manager:	Assumes responsibility for monitoring all fires from the time active burning is complete until all smoldering embers and risk of re-ignition are past.

BURN PROCEDURES:

This policy automatically provides the administrative authority to conduct operational burns, or to engage in short-term fire use in natural zones. Long-term burn programs on undeveloped park land require an approved Ecological Stewardship Management Plan, per Policy N05.

Requests to conduct operational burns are to be approved by the District Supervisor (in consultation with the Chief, Natural Resource Management Section, if they involve natural zones.) Once approved, they may be scheduled at the discretion of the facility manager unless they require burn bosses or trained support staff from off-site. Then they must be coordinated through the Fire Program Coordinator, who will give first priority to ecological burns. Operational burns must not conflict with the facilities' Natural Resource Management Plan or preempt planned ecological burns.

Requests to conduct ecological burns are evaluated by the Fire Program Coordinator, who will consult with the facility and appropriate natural resource steward to establish regional priorities. The Chief, Natural Resource Management Section will approve all ecological burns in the form of an annual prescribed burn schedule.

Once a request is approved for a regulated burn, a written plan must be filed that describes burn objectives; desired weather/fuel conditions, special risks, the expected ignition pattern, and escape contingencies. All plans must follow the guidelines provided in the Burn Procedures Manual and be approved by the facility manager and the fire program coordinator.

Once a fire is complete, the Incident Commander will relinquish authority over it to the facility administrator or designee. That person is responsible for overseeing, monitoring, and mop-up work until the fire is totally extinguished or all threat of escape outside the burn unit is over. A burn report must be submitted to the Fire Program Coordinator according to standards set in the Burn Procedures Manual.

CERTIFICATION REQUIREMENTS:

Anyone regularly working with prescribed or wild fires is required to attain a specified minimum level of training. Before assuming any position of authority over burn operations, or independently supervising workers, one must be certified by the Division at the proper level. There are three levels of certification, and they relate to different levels of fire experience and formal training that is needed to safely accomplish various tasks associated with prescribed burns.

Level I certification is recommended for all people who may occasionally work with prescribed or wild fires. Level I certification is required for all people who regularly do so.

Level II certification is required in order to assume any supervisory role over fire operations or people working on a fire, at a single facility. All incident commanders and crew leaders must be certified at this level.

Level III certification is required in order to serve as incident commander for burns at multiple facilities, or on high-risk fires. It is also required of the Fire Program Coordinator.

Certification criteria for each level are detailed in the Burn Procedures Manual.

XIII. CONTINGENCY PLAN

(List procedures for handling fire across the designated fireline according to the outlined categories listed below.)

A. **Fire Outside of Designated Burn Unit:**
(Spot Fire or Slop Over)

B. **Fire Outside of the Ecological Stewardship Management (ESM) area of which can be handled with onsite resources:**
(This is considered an "escape". Refer to area map.)
**** If the escape spreads outside of the ESM area and exceeds that which can be handled by the onsite resources than it will be declared a "wildfire".***

C. **Contingency Plan in the Event the Prescribed Fire becomes a "Wildfire":**
(Of which can <u>not</u> be handled with onsite resources.)

XIV. SMOKE MANAGEMENT PLAN

A. **Distance and direction to smoke sensitive area(s):**

C. **Transport wind speed and direction:**

D. **Visibility hazard(s), roads, airports, etc.:**

E. **Actions to reduce impacts to visibility hazards:**

F. **Traffic Management Plan**

ATTACH SMOKE VECTORING MAP FOR THIS SECTION

XV. WEATHER INFORMATION

(Monitor weather prior to burn, during burn operation, and postburn.)

A. Spot Weather Forecast (phone contact)

1.) Spot weather forecast will be requested following weather observation one day prior to the burn between 1300 and 1600 and the morning of the burn and communicate with the fire weather forecaster supplemental information to achieve a more accurate forecast.
2.) Burn Boss or designee will take weather readings with belt weather kit every hour during ignition.
3.) Notify visitor center staff to contact and relay information to fire weather forecaster during the burn if behavior not consistent with predictions.

B. Internet and Dial up Weather Stations

1.) Monitor Fire Weather Forecast on the National Weather Service and other related web sites.

C. Weather Radio

1.) If needed monitor weather by weather radio on hand held radio.

XVI. NOTIFICATION AND ACCESS

Agency & Individual Notification

Name	Phone Number	Needed ? Y/N
Fire Weather Forecast		Y
Fire Program Coordinator		Y
District Office		Y
MO Dept. of Conservation		Y
Mindenmines City Hall		Y
Barton County Fire Dept.		Y
Jim McClendon		Y
DEQ Regional Office		Y

Signing Plan, Road & Trail Closures

The following roads will be closed while burning is in progress:

XVII. PUBLIC SAFETY

(For example, are trail parking lots empty, traffic concerns, and use of headlights in smoke)

XVIII. COMMUNICATIONS AND DISPATCH

A. Communication Tree

1.) Use channel 1 on hand held and mobile radios.

a. Communicate all information through your crew specialist.
b. Crew specialists communicate all information to the Burn Boss.
c. If any crewmember is unable to reach the Burn Boss relay through the Visitor Center. If that is not possible make arrangements to break off one crewmember on an ATV to notify burn boss.

B. In case of declaration of wildfire

1.) Use Mutual Aide Channel on hand held for Fire Dept.
2.) If assisting Use MDC channel on hand held for Dept. of Conservation

XIX. BRIEFING GUIDE AND PREBURN CHECKLIST

A. Brief all participants on the burn plan with special emphasis on ignition patterns and schedules. Identify safety zones and escape routes to everyone.

B. Key Briefing Points

1. **History of Project Area**
2. **Objectives & Constraints**
3. **Maps and Assignment Sheets**
4. **Introduction of Personnel by Positions and line of authority**

5. Ignition Plan Objectives & Possible Problems
6. Holding Plan Objectives & Possible Problems
7. Phases of Ignition & Holding Operations
8. General Weather & Spot Weather Forecasts
9. Weather Data Collection Procedures
10. Contingency Plan
11. Safety and Medical Evacuation Plan
12. Any health considerations
13. Mop-up Plan
14. Communications Plan
15. Location of vehicle keys
16. Any questions from crew members
17. Preburn Checklist

C. PREBURN CHECKLIST

- a. Is burn plan complete and approved?
- b. Have firelines been completed and inspected?
- c. Have utility poles and posts been cleared around?
- d. Have all fire behavior guidelines been reviewed?
- e. Have all smoke management guidelines been reviewed?
- f. Is the current and projected fire weather forecast favorable?
- g. Are all personnel requested in the prescribed burn plan on-site, or have arrangements been made to link them with the fire crews?
- h. Have all personnel been briefed on the prescribed burn plan?
- i. Have all personnel been briefed on safety hazards, escape routes, and safety zones?
- j. Is all of the required equipment in place and in working order?
- k. Are available (including back-up) resources adequate for containment of escapes?
- l. Have the burn leaders reviewed the contingency plan?
- m Have all notification calls been made?
- n. Do all crew leaders have radios?
- o. Has extra fuel, water packs, and other supplies, been placed at strategic locations?

VISITOR CENTER DISPATCHER
FACT SHEET

1. If the Burn Boss contacts the park office for assistance because the fire has escaped and been declared "wildfire".

1.) Notify Doug Rusk at Stockton State Park.

2.) Request any remaining park staff for assistance.

4.) If fire is approaching or on private property then Burn Boss will instruct park office staff to notify the **Liberal Volunteer Fire Dept. (417)843-5245, and Barton County Fire Dept. (417)682-5541.**

5.) **If buildings are in danger dial 911** for immediate assistance.

2. Inform Fire Dept. dispatcher of the best access to the area.

- From Hwy. NN - Go West 4 miles on Central Rd. past railroad tracks to 150th Lane and follow 150th lane North to unit on West side of the road.
- From Liberal take K to P then to 150th lane and go south past visitor center to unit.

3. Inform Fire Dept. dispatcher of the proper equipment needed for control.

- Only hand tools, water, and blowers can be used while on the park property unless fire is threatening a structure.
- Burn Boss will request dozers if needed to protect buildings.

f. ~~ESM~~ DSP Policy/
prescribed burns

STATE OF MISSOURI
Mel Carnahan, Governor • David A. Shorr, Director
DEPARTMENT OF NATURAL RESOURCES
DIVISION OF STATE PARKS
P.O. Box 176 Jefferson City, MO 65102-0176 (314)751-2479
FAX (314)751-8656

DATE: March 24, 1995

TO: Parks with prescribed burn programs

FROM: Paul Nelson, Natural History Program Paul

SUBJECT: Prescribed burn planning guidelines

From 1975 through the end of last burn season, 525 prescribed burns totalling 54,444 acres have been conducted on a total of nearly 19,000 acres of state park lands. Our safety record has been excellent with very incidents and little involvement of private properties.

This spring, over 400 acres of private woods and pasture (including a close approach on a residence) burned as a result of four different state park originated prescribed burns.

Prescribed burning carries some very significant responsibilities and liabilities; thus I think it is time to review and reinforce our prescribed burning protocols.

* * * * * * * * *

To conduct a prescribed burn at any state park facility, you must at a minimum have or do the following things:

A) A burn plan approved by the Natural History Program, is to be on hand for every state park prescribed burn. This plan must emphasize in particular the range of normally acceptable weather parameters for conducting the burn, ignition patterns and fireline locations, escape contigencies, and special safety or control considerations to take into account. These plans may be faxed if necessary, and approval is by signature of the prescribed burn coordinator or Natural History Program director.

B) A fire weather forecast (National Weather Service -- 314/447-1887) is to be obtained at least the morning before the burn, and a record made of burn day temperature, wind speed and direction, relative humidity ranges, cloud cover, atmospheric stability, and smoke dispersal predictions. A record is also to be made (for woodland burns) of next day weather predictions.

RECYCLED PAPER

C) Trails into burn units are to be posted and closed the morning of the burn, or earlier if necessary to protect the public.

D) All prescribed burn bosses (including those from other agencies) must be at least S-390 certified, unless special authorization is granted by the Natural History Program.

E) The Natural History Program (myself, Ken, or Mike) and Regional Supervisors are to be notified (if available) prior to ignition the day of the burn. For normal mid-range weather conditions, the decision to proceed rests with the designated burn boss.

If relative humidity, wind speed, or fuelbed moisture approach the extreme limit set for it by the burn plan, permission to conduct the burn must be requested of either Ken or myself, or our designee. Permission to conduct the burn may be denied if fire weather forecaster weather predictions are deemed excessive due to risk to private or other park resources, inadequate personnel, local burn bans, numerous recent or ongoing area wildfires, or prolonged dry spells with greatly diminished fuelbed and 100 and 1000 hour fuel moistures.

F) For all woodland burns, or grassland burns where snags or smouldering woody debris may be present, there must be one or more persons assigned to post-burn mop-up and patrol duties through the evening hours. If burning conditions remain volatile through the night, this need may continue through the night at the burn bosses' discretion. There must also be a crew (one person minimum, depending on forecasted conditions) assigned the following day unless it rains. The first line check must take place early in the morning prior to the onset of good burning conditions. The intensity and duration of the mop-up and patrol duties may need to increase according to the severity of the nightime and subsequent daily weather conditions. Responsibilities for mop-up and at least periodic patrol do not end until all smouldering embers and debris are completely extinguished.

G) A follow-up burn report is to be submitted to the Natural History Program, which at a minimum will provide notations documenting parameters and considerations specified by the burn plan. Brief notes on fire behavior should be included, and all notable incidences (such as escapes) detailed. This may be done as notes on a copy of the burn plan itself. The Natural History Program is to be notified within the same day of any significant escapes from the burn unit, and especially if they involve private land or required extra assistance by other agency or fire department personnel. Contact Paul Nelson (314/897-4550) or Ken McCarty (314-642-8723) at home if an escape occurs on a weekend or holiday.

* * * * * * * * *

At the end of this burn season, I will call a meeting of all current or potential burn bosses to review the problems and escape scenarios that have occured in previous years. This will be conducted as a training exercise for all prescribed burn boss staff. Also, a work group will be established to review and update a set of prescribed burn procedures that will guide us on the use of fire in its very necessary role of managing natural ecosystems, or other uses. This will be attached to the Ecological Stewardship Management Policy which is also undergoing revision. Your input and suggestions on the above procedures will be welcome.

Keep in mind that the continued administrative and public acceptance of our prescribed burn program directly correlates to our safety record. Also, the likelihood of an escape or problem greatly diminishes as burn preparation and planning -- and the degree of training and experience of the burn leaders in technique and fire behavior theory -- increases.

In closing, I wish to emphasize that we are entering the very windy, unstable, and unpredictable weather conditions of spring. Even though we have a number of important burns yet to complete, everyone needs to be especially cautious and cognizant of how their fire is going to behave, and what might happen if it escapes.

Ken McCarty is designated as the Division's Prescribed Burn Coordinator. Please contact Ken if you have any questions.

Thanks.

c: Doug Eiken
Regional Supervisors
Ken McCarty
Mike Currier

1. We have been given conditional authority to proceed as usual with prescribed burns, **anywhere not suffering drought conditions**.

According to the National Drought Monitor, that currently means we can proceed with prescribed burns anywhere in Missouri except the bootheel and extreme northwest Missouri. Conditions change, and you will need to keep track of this. You can check out current drought status at:

National Drought Monitor at *http://enso.unl.edu/monitor/monitor.html* This is a product of the USDA, NOAA and other agenies that is updated weekly. It is a good reference to use.

Palmer Drought Index at *http://www.fs.fed.us/land/wfas/* This is best for long-term drought prediction, and uses a formula involving temperature and precipitation. Not as good for short-term forecasting.

Keetch-Byram (Soil Moisture) Drought Index at the same site as above, *http://www.fs.fed.us/land/wfas/*. This is updated daily. It models soil and duff layer moisture, with the index linked to fire behavior attributes. It is routinely used by fire managers for planning purposes.

2. **Any burn occuring in a drought area requires approval by the Division Director** prior to ignition. Route requests through me.

3. All burns must have an approved burn plan. Burn plans from previous years must be updated and newly signed.

4. The appropriate DEQ regional office must be notified that we are planning to burn, preferably the day prior to igniting any unit.

5. The fire program coordinator (me) must be notified of all planned burns, the day of or day prior to ignition.

6 Burns that are considered complex {termed "high risk" in the burn policy} require approval of the fire program coordinator or Director, Operations and Resource Management Program prior to ignition.

Examples of complex burns include those: ignited at prescription extremes; when the Keetch-Byrum Index is over 500; under "very high" or "extreme" NFDRS rating; "extremely unstable" atmospheric conditions; when 1000 hr fuel moistures are 15% or less; or that pose significant control challenges or risks. All of the ratings/indexes are readily available via the internet. Fuel moisture trends can also readily be tracked (we can provide you with up-to-the-minute graphs from any of several Missouri automated fire weather stations) and work well for planning purposes.
